BUY BARBER'S BIT BRACE.

WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere. MECHANICS' MILLS, 3v28-3m-sa Cor. Mission & Fremont Streets.

Consolidated Reforma Lead and Silver Mining Company.

Location of Mines, Mulege District, Lower California.

OFFICE, ROOM 10, No. 608 CLAY STREET.

Correct information from the Mines of the Company can always be obtained by application at the office.

LAST ASSAY, \$263 PER TON IN SILVER.

JACOB SCHREIBER, President.

A. D. CARPENTER, Secretary. 7v28-3m

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Ropes of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBES & CO., 611 and 613 Front street, San Francisco.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valve to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party respecting Patent Rights on Hydraulic Machines, whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macy's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

An Improved Mill Pick.

The accompanying engraving represents an improved mill pick, the invention of Jotham Cummings, of West Charleston, Vermont. The improvement relates mainly to such a construction of the pick as will relieve the strain upon the pick blade, and lessen liability of breakage of the same; and also to obtain greater strength in the head of the pick without increasing its weight, and enable it to deliver a more effective and well-directed blow than heretofore. The nature of this improvement consists in dividing the pick head into two parts, one stationary and bearing the handle, and the other detachable, and formed upon its inner face, with a series of teeth to engage the blade and prevent its being driven upward into the head. The parts are so arranged that the sharp end of the blade tends to settle the parts together, and firmly clamp the blade between the two. The great difficulty in getting picks drawn and tempered by blacksmiths, so that they will cut burr-stones, renders this invention valuable; for strong, fine cutting blades can be made without difficulty by experienced steel-workers, which require no blacksmithing, as they are tempered the entire length. The facility with which the blades can be changed is an important feature, as it is often necessary to remove blades for sharpening as many as one or two hundred times in dressing a mill or run of stones. Two sizes of the implement are made, one for furrowing, and the other for cracking.

Fig. 1 represents the entire pick, ready for use. Fig. 2 is a stationary stock bearing the handle, and Fig. 3 is a detachable clamp plate. The latter is a thin metallic plate, having a ratchet on its under surface, a convex rib, A, on its rear side, and a loop or socket, B. The pick or blade is a thin blade of even thickness, with its upper end bent to fit the notches in the clamp plate. In adjusting for use, the blade is placed upon the clamp plate, its sloping end entering one of the notches, when both are applied to the stock, C. The lower wedge-shaped end, D, of the stock, enters the loop or socket, B, of the clamp plate and the wedge-shaped lips of the clamp plate fit into corresponding channels formed in the ears, E, of the stock. It will be seen that a blow upon the cutting edge of the blade will force the clamp plate and blade upwards and cause them to embrace the stock with great power. The more powerful the blow upon the stone, the more firmly is the blade confined in its place. To remove the blade, the tool is reversed and the opposite end of the clamp plate struck on any solid substance, when both clamp plate and blade will be released. As the blades are abraded by use, they can be let down in the ratchet until worn out. They are tempered the entire length and only require grinding to sharpen.

IMPORTANT MINING CASE.—An important mining case is now before the Board of Confirmation in Washington. Commissioner Drummond has submitted to the Board the question of the right of the Secretary of the Cañon Mining Company, of Placer county, California, to obtain a patent for their mineral lands. The Cañon Mining Company failed to perfect their application on account of the suspension of the publication of the newspaper in which their notice was first published. The requisite time required by law was filled out by publication in another newspaper; but the Commissioner has decided that that is not according to law. The Board of Confirmation consists of Secretary Delano, Commissioner Drummond and Attorney-General Williams. They have authority to determine cases of defective applications for public lands, when the equities of the case demand justice for the claimants. It is a question whether their jurisdiction extends to mineral land cases, and this new case will be an important one, if they decide that the mining company is entitled to a patent. Many other cases of like character, where there are no adverse claims, will be submitted for settlement.

An Act to punish "salters" of mining claims has been passed by the Utah Legislature. Too bad they didn't pass it before, if it will be put in operation.

Gas Bracket Match Safe.

Everybody has experienced the annoyance of searching for matches in a dark room, doubtless to no small detriment of temper as well as such projecting portions of the body as are brought in sudden contact with vagrant rockers or sharp corners of tables and bureaus. Match safes, in fact, have the unpleasant peculiarity of apparently remaining in the spot where last placed, because every one using the

he employed to receive burnt sticks. In material, style, and design, the attachment may correspond to the bracket to which it is screwed.

For hotels, where lodgers are apt to carry off the match boxes, the invention is excellently adapted, while its convenient and ornamental form will doubtless commend it as a necessary appendage to the gas fixture of every room. Patented Nov. 4th, 1873. For further particulars address Orum & Mellor, sole manufacturers, 448 North Twelfth st., Philadelphia, Pa.

GAS BRACKET MATCH SAFE.

contents leaves the box wherever about the room he may happen to be, so that the next person is obliged to hunt for it. Moreover, about nine-tenths of the common match receptacles upset on the slightest provocation, strewing the floor with inflammable material, ready to take fire and burn holes in the carpet, and sometimes set dresses on fire, whenever accidentally stepped upon. We illustrate here-

OMAHA, Nebraska, has four smelting furnaces, four for lead and antimony, six separating furnaces, two cupels, two cupola, and twelve re-
sort furnaces. These smelt twenty tons of ore and separate and refine thirty tons of crude metal per day. During 1871, the shipments of silver and gold were \$1,020,639.54, of lead, 4,241 tons. The works did twice as much business in 1873 as in 1872, and more than twice as

CUMMINGS' MILL PICK.

with a new form of safe, the invention of Mr. M. L. Orum, which can neither upset nor wander about a room, because it is fastened immovably to the wall by screwing the gas bracket against it. The fixture is first removed, the hole in the device slipped over the pipe, and the bracket replaced, the whole being the work of a moment. Thus located, the box is always at hand when and where wanted, and, besides, is situated at the point where matches are usually scraped upon the wall, thus preventing injury to the paper or paint. It can be made with either one or two receptacles for matches, two being preferable, as one of the boxes may

much in January, 1874, as in the corresponding month last year.

Those who intend to start for the Stickeen mines, British Columbia, are cautioned not to overload themselves with provisions at Fort Wrangle, as most of the fortune-hunters so far have been compelled to throw a portion of theirs by the roadside, being overweighted for the journey.

Three teams, loaded with some 50,000 pounds of borax, from Teel's Marsh, left Columbus, on February 14th, for Wadsworth.

The Colombian Mines.

In a recent issue we gave an account of the gravel deposits in the different parts of the United States of Colombia and promised further particulars. The interior of the country, though generally well wooded and watered, is sparsely settled, and even the towns are few and far between. Large tracts of land entirely unoccupied lie in all directions over the country, and it is the policy of the Government to encourage immigration to settle up the country as much as possible. For this reason they give every facility possible to miners as well as agriculturists. Knowing or feeling that their land is rich in minerals, they are specially anxious to have practical men explore their country and open up its hidden wealth.

A miner desiring to locate a claim can "denounce" the mine, and the Government gives him half a league, or a mile and a half square for a gravel claim. The only thing required of the miner is to prove that it is mineral land and he must prove that he has capital to work his mine. If the land on which the ground is located belongs to private parties it may be bought from them or the discoverer can associate with them or lease from them.

The consuls of the United States of Colombia have been instructed by the Government to encourage the immigration of miners, as it is principally a mining country. The consuls are instructed to furnish all information available on the subject to would-be immigrants, and also to forward to the Government all information on the subject of mining possible to obtain. They have a stronger sympathy for the Americans than any other people, and are specially anxious to see practical California miners in their countries.

To get to Barbacoas from here, the steamer is taken to Panama. The fare is \$100 first-class and \$40 second-class. A line of English steamers run from Panama to Tomaco; fare, first-class \$50 and \$20 second-class. From thence to the river Palta, and by steamer to Barbacoas, \$15 first-class and \$10 second-class. This town is on the coast and has some 6,000 inhabitants. The whole country contains some 500,000 square miles, and has only 3,900,000 inhabitants, being very sparsely settled. To the mines already opened, roads have been made, but the roads in the interior are not of the best description, and, of course, the unsettled part has no roads. There is no danger of sickness in the mining region, it being elevated and in a pure atmosphere. There are no taxes levied on the mineral lands, and no duty on the export of bullion. Miners can get their bullion coined at Bogota or ship it out of the country, as they desire.

Mr. Follingsby, who has resided there several years, and who has furnished us considerable information about the country, will return in a few weeks with a complete outfit for working a hydraulic mine. He says the country is not one which a poor man should visit as yet. There are few mines being worked and capital is required to work them. The Government requires proof before giving title, that the prospector has capital to work his mine, and in default of this proof he can claim no ground. There is little chance for any one to obtain employment, and he says poor men have no business in the country. By this he means those who have not one or two thousand dollars to fall back on. Several other parties will return with him and he is now having a map of the mining country made to assist him in making locations. There is no doubt but that within the next few years the value of the mines of which we speak will be proved conclusively. The parties already working there, and those preparing to do so, will soon develop the facts. With a large extent of country, and encouragement and protection from the Government, if the mines prove as valuable as represented, there will be plenty of room for enterprising men to stake out their claims or find employment in the country. At present so little definite information is vouchsafed by those who are working the mines there, that it only stimulates curiosity. We shall endeavor to obtain all the reliable information possible concerning the country and lay it before our readers. Mr. Follingsby will on his return write us full particulars as to what is now being done there in mining matters.

CORRESPONDENCE.

Ore Beds—Their Origin and Condition.

[Written for the Press.]

Ore beds may from their nature be divided into two classes—enclosed or stratified beds, and surface deposits or placers. To the first belong ores of iron, hematite, simonite, and spothic iron, also magnetite. Immense beds of hematite occur in various parts of the country, notably in Northern New York, along the Adirondacks, in Michigan, Wisconsin, Missouri, and in the Black Hills of Wyoming. Lead ores occur in beds in American Fork District, Utah, and also in Dugway District. The deposits are generally small in extent, lie conformably with the enclosing rock and thin out in every direction. Copper beds occur in the copper slates of Thuringia, in Finland, as copper pyrites in the hornblende and chloritic schists of Pittkaranda. Many other metals occur in beds, or as bedded impregnations, as silver, mercury and gold. Those deposits are often capable of profitable exploitation. Though in the case of silver and lead profitable beds are the exception, not the rule. The copper beds of the United States have not yet been proved capable of profitable exploitation. Surface ore deposits, as the gold placers of the West, the stream tin of Cornwall, the platinum beds of New Granada, have proved of permanent value, rivaling true veins in their almost inexhaustible capacity for production.

Origin of Ore Beds.

The origin of ore beds is undoubtedly an aqueous one. That they were originally deposited in their present position is not always plain, but that they have been deposited either contemporaneously with the enclosing rock or subsequently to the formation of their footwall and previous to the formation of the strata overlying the mass, cannot be doubted, except in cases where pseudomorphic action has replaced part of the wall rock with the mineral composing the bed.

Now if we assume that all the metals composing the ore beds now existing, once formed a part of the interior mass of the earth and, as the cooling process advanced, the water penetrated the fissures in the rock as far as the heat would permit, flowing back to the surface charged with a part of the constituents of the rock, and the gases, arising from the fluid mass below, the sublimated metals were in this manner carried to the surface and again deposited in positions similar to those they now occupy. That this is probable we infer from the fact that beds of limonite are now being found in places where the waters of iron springs are allowed to settle, notably so in the Black Hills of Wyoming and in the Blue Ridge Mountains of Virginia. Ore beds may also have been formed by concentrations of extensive impregnations, just as impregnations may occur from the lixiviation of an ore bed. Of all enclosed ore beds, those of iron, from its great abundance, are the most numerous and easiest of determination; other metals exist in beds, but whether as true beds or impregnations is not always easy to determine.

Surface Deposits—Placers

Have either been formed by the decomposition of rock originally containing the metals, and the deposition of the metals in the bed or by deposition of the aqueous solutions flowing from mineral veins or springs. Metals may be found in ore beds or placers where no vein of the same kind exists, as is the case with platinum, or they may contain metals in paying quantities even when the vein from which they were probably derived is comparatively barren; this can be explained only by supposing that the products of the vein have been concentrated during the process of deposition in the bed.

Conditions of Beds.

Ore beds, though originally deposited in depressions of the earth's surface, are to be found occupying almost every conceivable position conformable to the dip and strike of the strata in which they are inclosed; hence we speak of the dip and strike of beds taking a horizontal line on the outcrop as the strike and the anticlinal or synclinal slope as the dip of the bed. The wall rock of ore beds is seldom well-defined, owing to the nature of their deposition being only found in the stratified rocks, and often deposited contemporaneously with them; their limits are not well defined, and often pass imperceptibly into the surrounding rock. Beds may be of enormous size, extending for miles, as are many of the hematite iron beds, or they be merely inconsiderable, lenticular bodies of only a few pounds; they may be no thicker than the hand, or hundreds of feet in depth. They may be distinguished from bedded veins by the absence of spure or off-shoots, and from impregnations by the absence of foreign matter. Ore beds furnish by far the largest proportion of the iron of commerce and a large proportion of the copper and gold product of the world.

J. H. MORRIS.

A Happy Time at the Richmond.

EDITORS PRESS:—Never since the stroke of the pick and hammer so vigorously wielded by those *avant couriers* of progress and civilization—the hardy, adventurous prospectors of Nevada—awoke the long silent echoes of our mountains and cañons, and manifested their faith in the richness and permanency of their mineral deposits by the inauguration of Eureka, as a mining center, has there been witnessed anything to equal in spontaneity, good feeling and jollity that which pervaded the immense assemblage that thronged the brilliantly illuminated offices and official headquarters of the Richmond company on last evening to do honor to its worthy, energetic Superintendent, John B. McGee. Rarely indeed has it been the fortune of your correspondent to participate in so hearty and undisguised an outburst of popular feeling and good will as that which greeted the aforesaid gentleman on his appearance last evening. It was an ovation to be remembered and to be proud of—worthy of the occasion, and highly honorable to the hardy sons of toil who bestowed it. In after years too, the handsome and valuable souvenir presented to him will help to recall from the gloom of the past the memories and associations which will forever encircle it, and like the lustrous gems that enrich and adorn it, render it all the more worthy of being preserved and appreciated.

As soon as it became definitely known that Mr. McGee intended to sever his connection with the Richmond and its employees, the latter determined on presenting him with something valuable that would be fittingly testify to him their esteem and demonstrate their appreciation of his acts while presiding over the destinies of the property he has by his rare industry and skill helped to render as valuable as it is to-day. To this end the subscriptions came pouring in in an unbroken stream from miners and furnacemen, and other recipients of his bounty and kindness, in a manner to give hopes of having in time sufficient capital to start a sagebrush bank with, or failing in this to defray the cost of the erection of some suitable monument to be placed over Eureka's jail—that terror to law-breakers—by way of cupola or dome, wherewith to perpetuate the political sagacity, purity and disinterestedness of our first Board of County Commissioners. This, however, need not be seriously thought of now, because the town and county archives will sufficiently attest to future generations their zeal for the public weal and purse. However, the money was readily collected—because all vied with each other in the amount given, and the alacrity displayed in giving it, and was thus unlike other affairs of the kind gotten up here on the high pressure principle, before, to try and confer honor and respect upon one who was known to be deficient of the qualities that should entitle him to either. The projectors, from the start, had in view the purchase of a costly watch—and accordingly an order to New York brought us one of Jergensen's superb time-keepers, valued at \$800, having engraved on the polished surface of the inside of the back case, the following significant inscription: Presented to John B. McGee by the employees of the Richmond Consolidated Silver Mining company, limited, of London, as a testimonial of their esteem and appreciation, Eureka, Nevada, January, 1874.

As already intimated, the presentation came off last evening in an impromptu way, at the company's official residence, where were assembled some two hundred or more, to witness the presentation; which was admirably made by the company's accomplished Secretary, M. D. Howell, who addressed the recipient in the following words:

"In behalf of the employees of the 'Richmond,' I have the pleasure of presenting you with this elegant gold watch and chain, as a mark of our esteem and respect. Your ability, in conducting the affairs of this company successfully, thereby opening a large field for labor, together with the pleasant and considerate manner you have always observed toward us, naturally called for this exhibition of our approval and approbation. As our foreman at the mine, Mr. Rositer, remarked, 'all were eager to contribute—so were the men at the furnaces.' May it beat over a heart as light and happy as youth; and, as old age comes on, may it recall the remembrance of this hour, as one of the delightful episodes that relieve the path of life, like flowers strewn in our path, by the hands of those we love. We ardently wish that good health, long life and prosperity may attend you and yours; and that this present will often be a suitable reminder of those friends who have labored with you in the past year."

Mr. McGee happily responded thus: "Mr. Howell and Gentlemen: To thank you for this unexpected token of your esteem and regard, is but a poor expression of the feelings of my heart. It will be cherished by me, not for its intrinsic value, or its qualities as a time-keeper; but, representing, as it does, one link in the chain that binds together the hearts of men of toil. It has been my constant endeavor to make the Richmond Company a success. That it has been accomplished will be seen by the quantity of ore developed since the 21st of September last; which is unprecedented in the history of the Pacific Slope; and, could the stockholders at London see what we see, shares would not sell for £6½, as they now

do; but would advance to £12, or £15. My place will soon be filled by another; but I hope you will give him that cordial support you have so willingly given me, and preserve the good name of the old Richmond. In conclusion, allow me to wish you a prosperous and happy life; and, I hope, when you are called to account for the deeds done here in the body, your hearts may be as pure and brilliant as this beautiful diamond I see in this locket."

The chief business of the evening being gone through, the large company present adjourned to the dining-hall to partake of the good things so temptingly displayed for their special delectation, and beneath whose superabundance the tables fairly groaned. Speech-making, song, and toasts were next in order; and many a flowing bumper of the delicious, sparkling wine of La Belle France was quaffed by the delighted beneficiary and his friends, in pledging each other's health and happiness. As the tongue-loosening champagne made the circle of the board pretty frequently, many a joke and repartee was gotten off, and many were the references made to the days of "Auld lang Syne," when amidst California's golden sands and placer treasures, they toiled and labored in search of the shining ore, that allured them from peaceful homes, to endure the trials and temptations to which they were so often exposed in the then new Eldorado of the West. For all of these things, I am inclined to the belief that were time to turn back in its flight, thereby reversing nature's irrevocable law, bringing with it a renewal of the flush times of '49 and '50, many of the gentlemen would willingly submit themselves with good grace to the little inconveniences, hard rubs, rough usages and nomadic mode of life which a return of those exciting days would once more bring with them. Such miracles not being wrought in these matter-of-fact days, we will return from the discussion of impossibilities—from the dead past to the existing present—its duties, sayings and doings.

In response to the toast of the Richmond mining company, Counselor Wren, the "Lawyer, miner and expert," began by saying he, too, had been a miner, though, perhaps not much in the way of silver and quartz workings, being what might be called a full fledged '49er, delving in the mines of sunny California until his hands had become as horny as any before him. His eulogium of the happy relation existing between the employer and employees of the Richmond, was well deserved and to the point, and their continuance would, he predicted, be productive of the greatest success to the future of the Richmond company. Judge Bailey next in response to repeated calls was "glad to congratulate" Mr. McGee and friends on the evidences of reciprocal good will and good feeling, that appeared to pervade the minds and hearts of all before him, and doubted not but the present was the proudest moment of the beneficiary's life. Each and every countenance around bore the impress of the kindest wishes and feelings, which hethought was the highest reward that could be paid to duty well and honorably discharged. He too, like the last speaker, became a miner and waded around in placer diggings, with long gum boots on, up to—well, as high as he could well get them, (laughter), and could therefore extend a friendly, sympathizing hand to all who shared in like labor, though then in a different walk of life.

In conclusion, Mr. Bailey expressed the kindest wishes for the health and prosperity of Mr. McGee, whom he hoped would observe the scriptural injunction of "watch and pray."

Attorney A. M. Hillhouse next followed in a few well chosen remarks in laudation of the good feeling existing between employer and employees, citing the fact that the unity, co-operation and labor of all had made the Richmond what it was to day, "the best mine, the pride of Eastern Nevada." Harmony was at all times necessary to success; without it all efforts were vain and futile; disaster would be the result. "The stranger's capital" too, he thought, should be watched over and encouraged, and as conscientiously guarded as any.

In conclusion, Mr. Hillhouse offered the toast of "Ruly Hill, the greatest mining hill in the world," to which J. D. Power responded by saying that he was glad to bear witness to the social, kindly gathering before him, for it demonstrated the warm, personal relations existing between all. He knew too, "from personal knowledge," that it was the spontaneous offering of the hearts of those present, and admitted "of no doubtful construction," but was a sincere and hearty testimonial of the esteem in which he (Mr. McGee) was held, by all under his control. He would, too, gladly bear witness that from letters which he had received direct from Europe, from stockholders largely interested in the welfare of the Richmond, that next to Mr. Clarence King, there was not a man in the country whose word was held in higher estimation in London, or who was considered more reliable in mining matters than John McGee. In conclusion, he would take pleasure in associating with him, in the toast before them, the name of P. Rositer, his worthy foreman at the mine, who was, as he himself declared, "his right bowler."

A toast to the *Sentinel* revealed the fact that Geo. W. Cassidy, its editor and proprietor, was present, and was loudly called on to respond, which he did in the most felicitous language and manner, bearing willing testimony to the fact that when the problem of smelting and reducing the ores of this section was agitating men's minds the mutual friend of those present appeared upon the scene and actually wrought out a success which had contributed

upwards of four millions annually to the wealth of the world, and he therefore thought that the testimonial, which was a magnificent one, was most worthily bestowed. In conclusion, he thanked them for the honor and compliment paid the *Sentinel*.

There were many other happily-conceived speeches made, which cannot be noticed now. It was certainly one of the most noticeable, as it was one of the happiest and most enjoyable, re-unions that ever took place in connection with mining affairs in this section, and one which will be recalled with pleasure in after years by those who participated in it.

The weather has been stormy and severe of late, beyond measure, snow-storm and frost alternating in regular order, with an occasional glimpse of sunshine thrown in, by way of appeasing the wrath of those who would otherwise call in question the weather decrees of Providence. Therefore, turn our weary eyes to whatever quarter of the cardinal points we will, we behold the hills and valleys as well as the most elevated mountain-tops, looking heavenwards, clothed in their "ascension robes," reflecting the purity and innocence with which those who in their turn shake off this mortal coil, must, by their acts, prepare themselves for a visit to that happy bourne whence no traveler has ever returned—the assertions of Manfred, Foster and that other Minchancean explorer among the planets, Andrew Jackson Davis, to the contrary, notwithstanding.

Eureka, Nev., Feb. 11th, 1874. J. D. P.

The Cassiar Mines.

A correspondent of the *Chronicle*, writing under date of Feb. 10th, says: I wish to give a friendly word of caution to all miners who may think of starting for the new mines that were discovered up in British Columbia, last summer. During the last three months about two hundred men left Victoria, bound for the Cassiar mines. The trip up as far as Fort Wrangel is a pleasant one, and this place is right opposite the mouth of the Stikkeen river; distance about fourteen miles across. The climate at Wrangel is quite mild, but when you leave the mouth of the river you will be getting into winter quarters. Every three or four miles that you advance up, the colder it becomes; and God only knows what hardships and sufferings these poor men have had to encounter who have started up during the last six weeks.

The steamer "Otter," Captain Lewis, arrived here last Saturday night, having on board W. Farron, who got up the river about forty miles, and as his glove on his left hand was not long enough to cover or reach his coat sleeve, in a short time his wrist was frozen and immediately began to swell up, and the result was he had to turn back, with his hand in a terrible condition, from which he has lost three of his fingers.

When the thermometer is say 25 degrees above zero up there, it is colder, owing to the bleak, cutting winds that you are sure to meet all the way up that river, than it would be in other places where it stood at four degrees below. There are times when these winds come down with such violence that it is all a man can do to stand up against them, not to speak of packing a pound. The river, as a general rule, is open between the 1st and 13th of May. When it is open men can go all the way by water, except about 90 miles of a trail which they have to travel. As to the extent of those mines but very little as yet is known, but the three creeks already discovered were found very rich wherever they have been prospected. Tibbard's creek is about 25 miles long, and is from 40 to 60 feet in width. The men who discovered this creek told me that with rockers they could average from one to six ounces per day, and having seen a lot of the dust they brought down, I could not think of questioning their veracity.

But you might ask, is it advisable for men who are making from \$3 to \$4 per day in California, Nevada and Idaho, to leave and run the risk of making their pile or losing all they have got, and their summer's work besides. I for one would say "No." Why? Because the mining season there is only four months; that is, from about the 1st of June to the 15th or 20th of September; and if the country is rich this year, why it is natural, I think, that it will be rich next year also; and besides, there are hundreds of miners going to Cassiar, from the Peace river and the Cariboo mines. I am of the opinion that there will be in this neighborhood of 1,000 men there by the 1st of June, but I have grave doubts if half their number will find paying claims.

One very important item, however, to all who may think of going up the river, is—to be sure and take provisions enough to last them until the season opens; for it will be late before merchants can get up stores to amount to anything, and then they will charge to the rate of starvation prices for all they may ship to that market.

PAYING THE LAWYERS.—The San Diego *World* states that the Executive Committee of the Julian miners are getting up a magnificent cabinet of specimens from the various mines in that district, which they will raffle at an early day, in order to raise funds to pay their attorneys. The case in which these lawyers were employed was the Cuyamaca Grant case, involving the title to the mines and the location of a Spanish grant. As before mentioned in our columns, this case was recently decided by the Commissioner of the Land Office in favor of the miners.

MECHANICAL PROGRESS.

English Printing Presses in America.

In the early days of newspaper printing in this country the machinery came chiefly from England; but when the Yankees began to invent, the importation ceased, and for many years the United States supplied novel presses to British and continental publishers. But English ingenuity appears to have taken a new start, and has produced printing machines of such superior capacity that New York newspaper owners are now buying fast presses in London.

We lately witnessed the practical working of two of the celebrated Walter presses, at the New York Times establishment in this city, and must confess to an agreeable surprise at their perfection and extraordinary performances. They were built in London, by Mr. Walter, the inventor, and set up here, under the immediate supervision of Mr. Gilbert Jones, of the Times.

They are known as perfecting presses, that is, both sides of the sheet are printed in passing once through the press. In ordinary presses, the sheets are introduced separately, printed on one side, then passed through again, and printed on the other side. This involves much handling, the employment of cumbersome machines, and many attendants.

In the Walter press, the paper to be printed is arranged in the form of a roll, like the goods in a calico printing machine. This roll of paper, 3 feet in diameter, weighing one-fourth of a ton, and containing paper enough for say six thousand copies of the Times, is placed at one end of the machine; the web passes thence between the printed types, which, in the form of carved stereotype plates, are secured upon the exteriors of a pair of geared cylinders. Rollers carrying ink press against the types, and the rotation of the type cylinders draws the paper along between them and the impression cylinders, thus printing the web on both sides; the web then passes between rotating shears, which divide the paper into separate sheets; and these, guided by a beautiful and ingenious arrangement of delivering tapes, are discharged in two separate piles, at the end of the machine opposite to that where the white paper enters.

The paper travels through the press with a velocity of ten or eleven miles per hour, and delivers at its highest speed some sixteen thousand printed copies of the Times, which, as all our readers know, is a large quarto paper—one of the largest in the country. A single number of the Times contains an amount of type matter equal to 147 ordinary octavo book pages. Perhaps we cannot better illustrate the astonishing rapidity of this machine than by saying that the printed matter it delivers in one hour would cover more than two hundred and thirty-five thousand book pages, or nearly four hundred volumes of six hundred pages each.

These remarkable printing presses are built with steel at all of the gearing parts, are the perfection of mechanism, and run with the steadiness of time pieces. One machine, attended by two men and two boys, is capable of a duty nearly equal to that of two of the old style, separate-sheet, ten-cylindrical presses, operated by twenty-five men. One of these old time monsters now stands idle in the Times press room. It is twenty feet high and forty feet long, full of complications. The new and simple new comer, by which it is replaced, occupies hardly a third the room of the other.

We have not space here to describe the various other mechanical appliances employed in printing the Times, such as double engines, boilers, blowers, steam ink pumps, folding machines, stereotype apparatus, etc., all of which are of admirable character, and have cost the proprietors over one hundred and twenty thousand dollars. This peculiar machinery, taken in connection with the enormous edition of the Times, exemplifies to a certain extent the wonderful progress which the world is constantly making in knowledge and the mechanic arts.—*Scientific American*.

THE MANSURATOR of W. M. Adams, an instrument designed primarily for the instantaneous solution of triangles, but capable, from its construction, of many other uses such as illustrating most of Euclid's theorems with regard to the triangle, of performing addition, subtraction, rule of three, extraction of square roots, of solving quadratics and simple binomial equations, and of reducing to mechanism some parts of analytical geometry. The Celestometer exhibited at the same time is intended to illustrate celestial longitude and latitude, the phenomena of the seasons, the correspondence of the calendar with the solar year, the precession of the equinoxes, the times of sunrise at any place on any day, the position of the principal stars during the night, and the general relations between the conceptions necessary for nautical astronomy.

Wool screws of Bessemer steel are now a regular article of manufacture at the Union works, at Cleveland, Ohio. These screws are said to be remarkably tough, and will bear from two to three times more strain than the heat iron screws in the market. The process of annealing, by which the steel rail ends are made suitable for screws, is at present a secret.

IMPROVED EXPLOSIVE ENGINE.—The object of this invention is to construct an engine which is driven by the explosive force of powder charges. The invention consists in the introduction and explosion of powder charges into chambers, which are alternately discharged to act on pistons, which turn the driving wheels, and are regulated by suitable mechanism. The base frame on which the engine is placed is of oblong shape, and contains two powder chambers arranged parallel to each other in longitudinal direction at both sides. The driving wheels produce, by alternately completing one half of a revolution on each wheel, rotary motion of a shaft from the reciprocating motion of the pistons. Each powder chamber is closed by an adjustable breech piece, which may be detached for cleaning out the chamber. The closely fitting piston moves in the chamber, its piston rod connecting, by a cross pin, with a strong spiral spring, which is also applied by cross head and pitman, to the side of a driving wheel. The required quantity of powder is introduced, in cartridge form, into the chamber by means of a vertical casing, which is arranged on guide rails placed on the top of the chamber. A brush of casing serves to secure the cartridge in recess of the sliding piece, which is carried forward and backward in guide rails. On the forward motion of the slide the cartridge drops into a chamber, to be carried back toward the breech piece by the returning piston, and be discharged by the concussion against the breech block. The piston is, by the explosion, forced forward again, and causes, by its action on the pitman, the rotation of the wheel. The smoke and gases escape through side apertures, admitting the immediate recharging of the chambers.

INNOVATION IN CARPET MANUFACTURE.—An invention has recently received provisional protection which relates to a novel manufacture of carpet, in which jute, or kindred vegetable fiber, is used in place of wool to form the face of the carpet. In order to impart to the jute or equivalent fiber, the character requisite for forming a soft pile face, instead of drawing or spinning the same into strong, close yarn, which is the common practice, the slivers are taken as they come from the carding engine, and just sufficient twist is put into them to convert them into soft, thick yarns. Of such yarns are formed the face-warps which are used in the carpet-loom to produce the novel carpet. In this loom, by the aid of the usual terry wires, a plain terry fabric is produced, the soft jute yarn forming the face of the same. On cutting the terry loops, the fibers composing them will open out, like those of worsted yarn, and will form a surface resembling a surface produced by that material. The jute fabric will admit of being dyed with woolen pile fabrics, a suitable mordant being employed for the purpose. By this novel mode of treating and applying jute to kindred vegetable fibers, a carpet having a rich appearance, and capable of enduring considerable wear, may be made at a cost far below that of the commonest woolen drugget.—*British Trade Journal*.

PROPOSED TUNNEL BETWEEN SCOTLAND AND IRELAND.—For many years there have been projects more or less before the public for uniting Scotland and Ireland by means of a tunnel; and the scheme has recently been again put forward; this time, however, with some reasonable probability of its being carried out. A single line tunnel, 15 feet wide at base, 25 feet wide at the maximum, and 21 feet high, the side walls of which would vary from 4 to 7 feet in thickness, is estimated by the present projectors to cost nearly \$23,000,000, with the approaches. The length of the tunnel would be about twelve miles, and it would extend from a point on the north shore of Ireland, near Belfast, under the Irish sea, to the extremity of the peninsula opposite to Scotland.—*Exchange*.

GLASS-LINEN PIPE.—An iron water-pipe was recently taken up in Boston and found filled with rust. The contamination of water conducted through lead pipes is also well-known. But both of these objectionable features are dispensed with in the recently patented glass-lined pipe, which does not contaminate the liquids passing through it, and is not corroded by them. The glass lining is held in the outer pipe, which is usually of iron, by an intermediate lining of cement, or plaster of Paris. This cement acts as a non-conductor of heat, and protects the glass against injury from unequal expansion of the glass and metal. When at six to fifteen degrees F., the water in these tubes will not freeze for a long time.

VULCANIZED RUBBER COATED IRON TUBES are now manufactured in Philadelphia, which will bear over 300 degrees heat, the rubber being prepared at 400 degrees Fahrenheit. The pipes can therefore be used for either hot or cold water. Gas and water are said to have no effect on them, and the coating resists sulphuric and muriatic acids and caustic potash solution. It is suggested that the process may be used for the preservation of iron ship plates and framing, if the rubber should resist the chemical action in copper in contact with iron in salt water.

A PROCESS for the conversion of plates which prove to be too hard for rollers into hard steel, is adapted for this purpose. It consists simply in heating the plate in contact with oxidizing substances below the point of fusion, precisely as malleable castings are made. The time of exposure to the heat depends on the amount of decarburization to be effected.

SCIENTIFIC PROGRESS.

Latest News from the Sun.

At a recent meeting of the Royal Society, Mr. Lockyer gave the results of his recent studies in relation to the spectrum of the sun.

The previous researches having shown that the former test for the presence or absence of a metal in the sun, namely, the presence or absence of its brightest or strongest lines in the average solar spectrum, was not conclusive, a preliminary search for other metals was determined on; and as a guide, Mr. R. I. Friswell was requested to prepare two lists, showing broadly the chief chemical characteristics of the elements traced and not traced in the sun.

The tables showed that in the main those metals which had been traced formed stable compounds with oxygen.

The author therefore determined to search for the metals which formed strong oxides, but which had not been traced.

The result up to the present time has been that strontium, cadmium, lead, cerium, and uranium, would seem with considerable probability to exist in the solar reversing layer. Should the presence of cerium and uranium be subsequently confirmed, the whole of the iron group of metals will thus have been found in the sun.

Certain metals forming unstable oxides, such as gold, silver, mercury, etc., were sought for and not found. The same was the case when chlorine, bromine, iodine, etc., were sought by means of lines produced in tubes by the jar spark. These elements are distinguishable as a group by forming compounds with hydrogen.

It is observed that certain elementary and compound gases effect their principal absorption in the most refrangible part of the spectrum when they are rare, and that as they become dense the absorption approaches the less refrangible end; that the spectra of compounds are banded or columnar, the bands or columns lying at the red end of the spectrum; that the absorption spectra of chlorine, iodine, bromine, etc., are columnar, and that these are broken up by the jar spark just as the band spectra of compounds are broken up; and that it is probable that no compounds exist in the sun. The following facts, gathered from the work already accomplished by Rutherford and Secchi, are stated:

- There are three classes of stars:
 1. Those like Sirius, the brightest (and therefore hottest?) star in the northern sky, their spectra showing only hydrogen lines very thick, and metallic lines exceedingly thin.
 2. A class of stars with a spectrum differing only in degree from those of the class of Sirius, and to this our sun belongs.
 3. A class of stars with columnar or banded spectra, indicating the formation of compounds.

WHEN CHEMISTS DISAGREE WHO SHALL DECIDE?—A deputation of master bakers, says the *London Medical Times*, waited on the Shore-ditch Vestry to inform the Board that to their personal knowledge they knew instances where alum had been mixed with the flour in baking which on analysis had been certified as being pure, while in other cases the bread which had been made purposely to test the analysis was stated to contain a quantity of alum that would be injurious to human health. These (as it would appear) contradictory certificates had not been obtained from the parochial analyst, but from Dr. Letheby and Professor Gardner, of the Royal Polytechnic Institution. The statement of these facts has induced the Vestry to refer the whole question to a special committee for consideration. It was further resolved to invite parochial analysts and others to attend the committee meetings and assist them in their investigation of the matter.

W. J. LAND proposes the use of carbonate of silver for determining the amount of hydro-sulphuric acid in mineral waters. Pure moist carbonate of silver is prepared by precipitating nitrate of silver with carbonate of soda in a room from which all actinic rays are excluded. This is shaken with a known quantity of the water; the solution is warmed gently, and then allowed to settle; the greater portion of the liquid is decanted, and the precipitate is digested with weak nitric acid, to remove excess of carbonate. The undissolved salts are then thrown upon a filter, and washed first with distilled water and then with dilute ammonia, to remove haloids; when the last traces of these have disappeared, wash with a little alcohol, and then dry at 100° C., and ignite in a porcelain crucible, adding a little sulphur.

MR. JOHN AITKEN has observed, that after the same water had been melted and frozen a number of times, it generally burst the tube in which it was frozen. This he explains on the hypothesis that ice containing air is viscous and adapts itself to the form of the vessel; by repeated freezings the air is removed, and the pure ice being less or but little viscous will not so easily adapt itself to the enclosing walls.

THE purest water acts most powerfully on lead, forming carbonate of a peculiar and uniform composition. All salts impede this action.

COMBUSTION AND ITS PRODUCTS.—It has been satisfactorily determined that the combustion of coal in furnaces is indicated by the ratio that the amount of carbonic acid bears to the amount of the carbonic oxide in the escaping gases. While the former has six parts, by weight, of carbon and sixteen parts, by weight, of oxygen, the latter has six parts, by weight, of carbon, and eight parts, by weight, of oxygen. It is evident, therefore, that the latter is capable of combining with eight parts, by weight, more oxygen than it already possesses. As the combustion of the carbon is simply its combination with oxygen, and as all the oxygen that can combine with the carbon, so far as yet determined by chemical investigation, is the proportion met with in carbonic acid, it is evident that, in complete combustion, no carbonic oxide would be present. When it is found in the products of combustion it is capable of combining with 8-14 of its weight of oxygen, and of developing the heat to fit it for combination.—*Artisan*.

COMPASS DEVIATIONS.—In examining the causes of the deviation of the mariner's compass on shipboard, the influences of the hulls of iron vessels have long been demonstrated. But, in addition to other disturbing causes, it is now said that the varying distribution of heat over an iron hull is also a disturbing influence, and a contemporary gives some curious instances of it. A steamship going up the Red Sea had the blazing rays of the sun striking one side in the morning and the other side in the evening, the result being a marked difference in the deviation. A steamship voyaging from Liverpool to New York, passes through cold polar and warm Gulf Stream currents in alternate bands between Newfoundland and Nantucket, causing a deviation of ten degrees. A ship in port with hot sunshine on one side and the cool shade upon the other, sometimes shows similar compass deviations.

NEW PHOTOGRAPHIC PROCESS.—A recent improvement in dry plate photography consists in using gelatin instead of the ordinary collodion. The nitrate of silver, for sensitizing the gelatin, is mixed with the gelatin solution; the only drawback to this new process was the fact that the gelatin solutions could not be long preserved, especially in warm weather. This difficulty has been lately overcome by Mr. Burgess of England, who prepares the sensitive gelatin solution in any quantity that may be desired, and, after preparation, desiccates or dries the same by spreading the solution on glass plates. The dried film is then broken up into small bits and packed away in dried condition for use. Thus prepared, it will always keep good and only requires to be dissolved in water, to form an excellent sensitized solution.—*Scientific American*.

EXPERIMENTS made by Von Pettenkofer on the amount of water evaporated from an oak tree, show that atmospheric humidity, in so far as it depends upon the presence of forests, is promoted rather by the roots of trees drawing moisture from the earth, than by attraction exercised on rain clouds by the leaves. The latter serve rather as outlets through which the moisture drawn from the soil passes into the air. The oak tree observed by Pettenkofer was estimated to have seven and eight hundred thousand leaves, and the total amount of evaporation in a year was computed to be eight and one-third times more than that of the rainfall on an area equal to that covered by the tree, the moisture exhaled by the leaves being equal to some 211 inches, while that from the rainfall was but twenty-five inches.

THE USE OF DYNAMITE.—The superior advantages of dynamite over gunpowder were very remarkably illustrated recently at the Aire-dale works. A number of steam-hammer blocks or anvils, weighing from 8 cwt. to 10 cwt. each, and which have usually to be sent away to be broken, were experimented upon, each with a two-ounce dynamite cartridge. Dynamite exploded from the surface of the blocks would have broken them, it is said, but in this instance the cartridge was placed in a small drill-hole. In each case the cartridge on exploding had the effect of rending the blocks into three or four pretty equal parts. It is likely after these experiments that dynamite will be largely used in the breaking up of large pieces of old metal.—*Ironmonger*.

RED AND WHITE MUSCLES.—On application of the electric current, the white muscles are found to contract almost instantly, and respond even to rapid and continuous shocks. The red muscles, however, require a certain time to feel the excitement, and when quick, interrupted discharges of electricity are administered, they assume permanent contraction. Hence it is concluded that the latter are involuntary, and of the nature of the muscles of the heart, while the former are controlled by the will.

MATCHES, tipped with potassic chloride, ignited by dipping into a bottle of concentrated sulphuric acid, were first manufactured and used in 1838. Friction matches were first made in 1832, with potassic chlorate and antimony sulphide. Soon after phosphorus was used in the tips.

POISONING BY SILK.—M. Chevalier mentions a practice of some manufacturers, of weighting their silks with a solution of lead acetate, by which means poisonous properties are imparted to the silks, as well as an increase in weight.

in February \$380,500. In 1873, the Belcher, Cederborg, Consolidated, Amador, Crown,

in February \$380,500. In 1873, the Belcher, Cederburg, Consolidated Amador, Crown Point, Eureka, Monitor-Belmont and Raymond & Ely were paying dividends.

A bill has been introduced in the Legislature by Duffy, which is of interest to stock brokers. It is intended to prevent brokers from selling out stocks bought for persons on margins, without giving five days notice by advertisement. It is as follows:

Weekly Stock Review.

THURSDAY, Feb. 26, 1874.

There has been some little excitement in the stock market this week, but at close a decline in prices is apparent. Monday being Washington's birthday, there was no session of the Board. The fluctuations in prices for the week are of no great moment, and few large advances will be noticed. In Washoe stocks, Alpha Consolidated has run between \$15½ and \$12¼; Baltimore Consolidated, between \$5½ and \$6¼; Best and Belcher, between \$2½ and \$23; Caledonia, \$27½ and \$30; Chollar, \$73½ and \$71; Consolidated Virginia, \$67 and \$70; Crown Point, \$91½ and \$103; Exchequer, \$22½ and \$27½; Gould and Curry, \$21½ and \$24; Belcher, \$89 and \$100; Hale and Norcross, \$59 and \$65; Justice, \$8½ and \$9½; Kentuck, \$22½ and \$25½; Ophir, \$36 and \$39½; Overman, \$61 and \$76½; Savage, \$104 and \$118; Seg. Belcher, \$89 and \$106; Sierra Nevada, \$17 and \$22¼; Yellow Jacket, \$69 and \$72½; Raymond & El fluctuated between \$31½ and \$38½; Empire, 87½ and \$83½; Golden Chariot, \$20 and \$21½; South Chollar, \$19 and \$26.

On Friday prices severally showed an advance. Belcher rose \$2; Crown Point, \$7; Chollar, \$1; California, \$1; Ophir, \$1; Savage, \$5; Seg. Belcher, \$10; and Overman \$5.

On Saturday the market was quite strong and firm. Belcher rose 50 cents; Cons. Virginia, \$1; California, \$1; Crown Point, \$4; Gould & Curry, \$1; Hale & Norcross, \$1; Seg. Belcher, \$4; and Savage \$2.

On Tuesday the market was strong and lively, with generally better prices at close. Belcher rose \$4; Best & Belcher, \$1; Crown Point, \$5; Yellow Jacket, \$1; Savage, \$2; Ophir, \$2; Kentuck, \$1; Alpha, \$3; and Cons. Virginia \$2.

On Wednesday the market broke, and prices declined. At close Crown Point showed a fall of \$10 from prices on previous day; Belcher, \$11; Ophir, \$1; Overman, \$12; Savage, \$8; Cons. Virginia, \$3; and Hale & Norcross, \$3.

A Crown Point dispatch of the 23rd says: I 1,500 drift we have about one-third of the face still in rich ore; the other two-thirds is porphyry, resembling east wall. Average assays from north winze, yesterday, went \$119; average from middle winze, 1,400, \$293; average from main drift, 1,500, \$242.

The Golden Chariot mine shipped on the 15th, \$11,321.98, making thus far in February a total of \$44,797, the proceeds of one mill.

The Belcher letter of the 21st for the week ending that date says: "Ore extracted, 300 tons ore forwarded to mills, 257 tons, 300 pound. Average assay value of ore mined, \$31 per ton. The impossibility of getting ore hauled compelled the suspension of extracting, owing to lack of dump room. The drift south at the 4th station has been driven through hard rock 30 feet have been added to the length. This morning the material at the face is much softer—all porphyry. At the 5th station 100 feet have been added to the length of the drift. A few small bunches of ore have been met with as the drift has advanced. Up to this writing prospects for ore making in large quantities are not as favorable as could be wished for. The face of the drift has little else but porphyry."

Dividends this month from mining companies have been as follows:

NAME.	PER SHARE.	AMOUNT.
Belcher.....\$5	\$520 00
Belcher.....25	7 1/2
Crown Point.....3 00	300 00
Keystone Quartz.....60	60 00

In the same month last year the mining companies paid \$839,000; in 1872, they paid \$832,000.

It is intended to prevent brokers from selling out stocks bought for persons on margins, without giving five days notice by advertisement. It is as follows:

SECTION 1. All contracts for the sale of mining stocks pledged to secure advances, or for the purchase or sale of stocks on margin, which permit a sale of the same without a notice of at least five days to the pledgee or borrower or purchaser or seller, as the case may be, are hereby declared null and void.

SEC. 2. All stocks sold on account of advances made thereon, or on account of the failure of the purchaser to keep a margin thereon good, shall be made at public auction, after a notice of at least five days has been given and published in a daily newspaper in the State of California.

SEC. 3. All Acts and parts of Acts in conflict with this Act are hereby repealed.

SEC. 4. This Act shall take effect immediately.

The Bellevue Mining Company have called a meeting for the 14th of March, to take into consideration the proposition to increase the capital stock of the Company from \$500,000, 8,000 shares, to \$2,000,000 in 20,000 shares.

1) The War Eagle Company propose to increase their capital stock from \$1,000,000 in 10,000 shares, to \$2,000,000 in 20,000 shares.

The El Dorado North Company propose to increase their capital stock from \$2,500,000 in 25,000 shares, to \$5,000,000 in 50,000 shares.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

SILVER GLANCE.—*Miner*, 21: The shaft in this mine was found to be 135½ ft. in depth—35½ feet below the 100 ft. level—by actual measurement last Monday morning; 5½ ft. having been sunk during the previous week. Every car load brought to the surface showed more or less quartz, with fine looking sulphurets.

The M. & N. W. mill is undergoing changes by which it is to be converted into a wet crushing and raw amalgamating establishment.

From Silver Mountain, we learn that the reports of a rich strike by the men in the Exchequer mines are confirmed. Manager Chalmers is about to start his mill (the Exchequer) and will make a short run on some ore now on hand. Mr. White, of the M. & N. W. mill, has engaged to make the run.

AMADOR COUNTY.

THE KENNEDY.—*Ledger*, Feb. 21: On Monday last we paid a second visit to the above named mine, and made a careful examination of the level running south from the foot of the new shaft. Since our first visit the level has been driven further south about 25 feet, in which distance an immense amount of rock has been taken, and all of excellent quality. The width of the ledge is unknown. A break of 20 ft. wide on the ledge is being taken down, but does not extend to either wall. The foot wall has been reached north of the present work; and, in driving south from that point at least 10 ft. of rock on the foot wall has been left; the hanging wall has not yet been reached. The ledge has now a known width of 30 ft. The entire mass of rock is of good milling quality, and known as ribbon rock. There is ore enough now in sight to employ the present crushing power of the company's mill for years to come. The crushing capacity of the mill connected with the mine, is wholly insufficient for the profitable working of the mine.

ONEIDA.—The Oneida mine is looking remarkably well. The ore taken from the 900-ft. level shows a considerable increase in value over that taken from any of the levels above it, and the ledge fully as wide and well defined as at any other point. Besides, the chute or chimney is rapidly increasing in extent as greater depths are reached.

CASCO.—Work on this mine has been temporarily suspended, on account of the recent severe storms. The last work developed a ledge ten feet in width, with well defined foot and hanging walls, accompanied by a "gouge" equal to that of any mine on the mother lode; the walls possess the same pitch as those of the Amador mine at Sutter creek.

ANOTHER RICH STRIKE.—*Dispatch*, Feb. 21: We understand that a large quantity of exceedingly rich rock has recently been struck in the old "Skunk" mine, near Pine Grove. Some of the rock, it is thought, will pay about \$500 per ton. This mine was worked on a small scale several years ago, but it appeared that the proprietors "weakened" or became discouraged before they reached "pay rock." We are of the opinion that there are quite a number of other half-worked, abandoned quartz mines in this county that would prove equally as rich, if some person or company would take hold of them, who had sufficient means and energy to give them a fair test.

THE VOLCANO GRAVEL TUNNEL.—The gravel tunnel now being run into the gravel hills near Volcano is progressing finely and with every prospect of being completed at an early day. It is already in about 250 feet, and a contract has just been let to the Provis Bros. for running it in one hundred feet further. The company expect to strike good pay gravel at about 1,200 feet.

SINKING A SHAFT IN JOAQUIN'S CAVE.—(Continued from page 10.)

learn that some parties have recently commenced sinking a shaft in the celebrated Joaquin's cave, about two miles from town, for the purpose of prospecting a quartz lead which runs through the hill and under the cave, and which is thought to be rich.

BUTTE COUNTY.

ANOTHER CLEAN UP.—*Record*, Feb. 21: The Spring Valley Company at Cherokee have made another clean up, and have sent below three bricks valued at something over \$73,000. This is a very comfortable clean up for a month's run; and the beauty of it is, it is liable to continue, as the company has secured a monopoly of the waters of the West branch, in addition to their former rights to Butte creek waters and those of Concow valley, which will give the company a constant supply of fluid when Jupiter Pluvius ceases to govern the clouds. They also own, by purchase, a good portion of the valley lying along the line of Dry creek which is being used for a dump. The Cherokee mines are among the best in the State, and we are glad to note that those who have labored so long are in the enjoyment of their harvest.

EL DORADO COUNTY

AMADOR CANNABAR MINE.—*Amador Dispatch*, Feb. 21: The last reports from the above named mine, lately discovered in El Dorado county, and owned by citizens in Jackson, represent the discovery as presenting very favorable indications of permanence and value. Ore enough is now upon the ground to pay all expenses so far incurred, and to run the tunnel now being driven, well in upon the ledge, without calling upon the company for assessments. Ore brought over to-day looks remarkably rich.

YET IMPROVING.—*Republican*, Feb. 21: The Oregon Hill Mining Company, of whom mention was made by us last week as having struck the ledge at a depth of 300 feet and found it rich, are developing a large ledge of splendid ore. This is the same ledge that was discovered by Mr. L. Sheppard some five years ago, and which was worked by himself and Witten for some time with fine success, they having taken out some \$35,000 from a body of ore found near the surface.

STILL SINKING.—The owners of the "Rose" ledge are still driving down their shaft, and are now down between 35 and 40 feet below the tunnel, at which depth we are informed the ledge is solid, about two feet in width, and of splendid character. The Oregon Hill Mill has been at work on rock from this ledge all the week, and they have every reason to expect a fine clean up.

FIVE-CENT HILL MINE.—We hear highly favorable reports from the claim of Bilty & Co., on Five-cent hill, near Greenwood, which is one of the most extensive undeveloped gravel deposits on the north side of our county. Recently they have prospected the surface with a common rooker, and in six days one man rocked out eighty-seven dollars. This was from surface dirt. In one place, on the bed rock, they found one piece of gold which weighs twenty-six dollars. Mr. Bilty has gone below to forward a lot of material and supplies for fitting up in first-class order for extensive operations. Iron to the amount of over sixteen tons has been ordered, of which to make something over four thousand lineal feet of eleven-inch pipe. The company expect to have all arrangements completed and to be under full headway by the first of March, when it is confidently believed that a thousand dollars per day will be realized.

The new ditch company will commence operations on the big ditch project the last of next month.

The Taylor mine, near Greenwood, has struck a streak of rock as rich as any ever taken out of the Cederberg.

The Company which has purchased the Crusen claim, immediately north of and adjoining the Granite Tunnel Co., have let a contract to sink an incline, and the work is now being vigorously pushed forward. They have also let a contract to erect a ten-stamp mill, which they intend to have in operation within sixty days. At this rate this section will be able to speak for itself.

ITEMS FROM GEORGETOWN.—*Democrat*, Feb. 21st: A nugget of gold weighing about ten ounces, was found in the Cooley claim, near Volcanville, last Friday.

The Taylor mine is proving immensely rich. At the lower level they have struck a vein two inches wide that is rich beyond description, almost solid gold. The Taylor mine is situated about three miles south-east of Georgetown.

KERN COUNTY.

GOLD PER TON OF ROCK.—*Miner*, Feb. 21: Following is an exhibit of the highest amounts, that surface rock of some of the mines in Kern county have paid to the ton: Dolphi, \$700; Relief, \$244; Bamboo, \$103; Uncle Abe, \$83; Lynchburg, \$100; Relshford, \$106; Cape Horn, \$79; Venns, \$99; Venus, No. 2, \$78; Jenny Lind, \$149.50; Howe Leads, \$70 to \$92; Joe Walker, \$55; Big Blue, \$53; Sumner, \$107; Keysville Lead, \$300; Mammoth, \$74; Bright Star, \$80; Pamp Williams, \$109; Bella Union, \$194; Grant \$74.50; Mountain Boulder, \$65; St. John, \$60; Burning Mountain, \$65; Belmont, \$104; Young America, \$100; Hope, \$403; Long Tom, \$80.

HOW ENCASER.—The Honduras, Bolivia, Venezuela and Carribean mines, which are located on the same lode, are encased by black granite and slate walls. Back of the Marsh & Kennedy mill the ledge runs into a slate formation, and can be traced right along over the summit to Hot Spring Valley, from thence to Kernville and to the Big Blue.

FROM KERNVILLE.—The Big Blue is producing its regular amount of quartz, and the vein is enlarging.

KLAMATH COUNTY.

OCA MINES.—*Cor. Lake County Bee*, Feb. 19th: Chief amongst them the Black Bear is conspicuous, not only for its richness, but for its system of labor and consummate skill of management. The Sup., W. A. Farrish, has been busy for the past three months in perfecting his arrangements for sinking on the vein. The main tunnel had to be widened 1,000 ft. to enable them to run a larger car; a "raise" made to the surface as an exhaust for the engine; a larger chamber excavated for the engine and boiler, the whole well secured by immense timbers; the boiler built on the outside, brought and placed in position, the engine set up and got in running order; in short, every precaution which knowledge could suggest, or skill accomplish, has been energetically followed and thoroughly completed, to render the raising of the precious ore easy and rapid. The mill—of 28 stamps—is constantly running, night and day, and the teams are as steadily hauling every day.

The Klamath quartz mine is running a tunnel for their ledge, and are in about 460 ft. They have already started one "raise," and will soon commence another to cut the ledge overhead. One month will be required to perfect all arrangements before they commence to crush. A good summer's work is looked for with certainty.

Morning Star is crushing good paying rock. Although they have not cleaned up, judging from the amalgam on the plates it will pay handsomely.

Evening Star is crushing away vigorously.

NEVADA COUNTY.

WASHINGTON BAYS' MINE.—*Grass Valley Union*, Feb. 20: This mine is located on Bays' ranch, near the North Star. The owners are Michael Colbert, Martin Ford and others. The shaft is down something like 50 ft., and from the bottom drifts have been run both ways on the ledge. One drift is in the distance of 100 ft., and the other is in about 80 ft. Along the whole distance the rock shows well in gold and sulphure. Some of the quartz is decayed, and in that the gold is easily washed out with the common pan. A few days ago less than a handful of the decomposed rock was tried and it yielded free gold to the amount of \$10 or over. The Bays Company have out about 100 loads of quartz already, and are adding to the dump pile every day.

SAN BENITO COUNTY.

THE CATERINA COAL MINE.—*San José Mercury*, Feb. 19: Mr. John Anzeris, of the firm of Anzeris & Brother, returned yesterday from a brief visit to the Caterina coal mines, in San Benito county. He brought back with him some fine specimens of coal, taken out by himself, which burn well. Mr. Anzeris informed us that work is progressing satisfactorily in the mines, and that the indications are most favorable. Fifteen ft. from the entrance of the main tunnel, a branch tunnel commences running at right angles 12 feet; at the terminus, the finest quality of coal has been discovered. In the main tunnel the prospects are not near so good as in the branch.

SIERRA COUNTY.

OVEA NORTH.—*Cor. Messenger*, Feb. 14: I hear they have plenty of water at the Monto Christo and Union for washing their spare dirt. I was told at Whisky Diggings (now "Widowville") that the North American Co. had lost their main lead, it having taken a notion to jump off to unknown depths toward Pilate Peak No. 1. This company's tunnel is about 80 ft. lower than that of the North American, and will, no doubt, tap the lost lead in the great basin they are running for, their tunnel being nearly in.

Nevada.

ELY DISTRICT.

RAYMONN & ELY.—*Pioche Record*, Feb. 14: Main shaft down 1,150 ft., and sinking at the rate of 16 ft. a week. At the depth of 1,200 ft. another (the eleventh) station will be opened. On the 10th station, going south, the drift is in 230 ft. Expect to cut the ledge in this drift at a distance of about 280 ft. from the shaft. Sinking a winze from the 9th station, in the vein, which is now down about 70 ft. The ore in this winze is low grade, but the vein is strong and well defined.

MEADOW VALLEY.—No 3 shaft is 30 ft. below the 1,100-ft. level, and continues going down rapidly. Drift north from the 1,100-ft. level, running to cut the vein, is in 39 ft., and expect at every blast to break into the vein.

NEWARK.—No hoisting of ore is done at present, owing to the restraining order of the District Court. On the 26th the arguments of counsel in the injunction matter will be commenced, and the decision of the Court will of course have its effect upon the future movements of the Newark company. Appearances throughout the mine continue as favorable as ever before.

AMERICAN FLAG.—The drifts are being extended rapidly with the usual force of men, and the drifts are looking encouraging. Hoisting about six tons daily from the lower levels. No stopping has been done yet. The mills are kept running night and day, working about 23 tons every 24 hours, with satisfactory results.

PIOCHE.—Sinking is still going on, and within a very short time the first level in the new shaft, at a depth of 660 ft., will be opened. In the old works, prospecting continues throughout with promising results.

BOWEAY.—The drift on the 500-ft. level is being pushed as fast as possible, with the best kind of indications of soon cutting the ledge.

PORTLAND.—The drift is being run as fast as possible in the lower level. The mine looks well throughout.

PIOCHE WEST.—The ledge has again come into the winze—having for a time been thrown out by a header—and is now showing an improved quality of ore.

PRAYNE.—Work on south drift continues with unabated energy. An improvement in the general appearance of the mine is observable.

PAOR AND PANACA.—Three drifts are still being run with the usual number of men.

HURN AND HUNT.—Drift in 950 ft., and from the appearance of the rock it is very evident that the ledge will soon be cut.

ALPS.—East drift improving. Now in 312 ft., and work continues with the usual force.

WASHOE DISTRICT.

CALDONIA.—*Gold Hill News*, Feb. 21: Forty-five feet has been added during the week to the west drift, at the 600-ft. station, making the total length from the shaft 200 ft. The shaft has been put in perfect repair to the 600-ft. station, and in a few days more the pump columns can be taken out down to the 250-ft. level or the mouth of the drain tunnel.

NEW YORK CONSOLIDATED.—The main shaft is down 492 ft. Some of the streaks of quartz already passed through by the shaft, have given very good assays.

OPHIE.—The face of the main south drift on the 1,700 ft. level is still in hard blasting porphyry. The bottom of the south winze on the 1,465-ft. level is still in fine ore, and has some 30 feet to sink before reaching the west well. The south winze on the 1,300-ft. level reached the west wall at a depth of 83 ft., at which point a cross-cut was started east to prospect the ore vein, the face of which is still in good ore. The up-raise from the 1,465-ft. level is still in good ore. The face of cross-cut No. 2, on the 1,300-ft. level is in clay and quartz mixed, indicating a near approach to the main ledge. It is expected that the extraction of ore will be commenced in about two weeks' time.

SAVAGE.—The main south drift on the 1,900-ft. level, yesterday morning, at a distance of 73 ft. from the main incline, cut the clay well of the ore vein, finding some small bunches of quartz of a very favorable looking character.

BELCHER.—Daily yield, 600 tons. The ore stops on the 1,200 and 1,300-ft. levels are looking splendidly. The 1,000-ft. level also gives promise of a fine yield of ore for many months to come. The company have a vast quantity of low grade ore on the 1,100-ft. level, that will pay well for working, and which they are preparing to extract. The mills on the Carson river are running up to their full working capacity. The main incline is down 91 ft. below the 1,400-ft. level, in hard blasting ground. The north drift from the 1,400-ft. level is in 73 ft. in hard, tough ground.

CAWON POINT.—The main south drift, on the 1,500-ft. level, is making good progress, the face still in ore. The north winze on the 1,400-ft. level is down 50 ft.—the entire distance in rich ore. Another winze has just been started, 140 ft. north of the Belcher line, which is down eight feet, also in rich ore. The winze, in what is termed the "east development," is down 29 ft.—the entire distance in rich ore. Daily yield, 450 tons of ore, which is mostly being extracted from the 1,300, 1,200, and 1,000-foot levels. The ore stops and breasts are looking finely at all points, and the future of the mine looks bright and prosperous.

GOULD AND CURRY.—The east drift on the 1,700-ft. level is in 258 ft.—the face in hard blasting porphyry. The north drift on this level is in 93 ft. The face of the main north-east drift on the 1,500-ft. level, is in a mixture of quartz and porphyry. There is also quite a strong flow of hot water from the face of this drift, and the air is so extremely hot that but slow headway can be made.

IMPERIAL-EMPIRE.—Sinking both the north and south winzes on the 1,700-ft. level is making fair headway, the bottom of both being in quartz of a very fine character.

SCORPION.—The old tunnel is cleaned out its entire length—800 ft.—and thoroughly repaired and re-timbered.

CONSOLIDATED VIRGINIA.—Daily yield, 160 tons. The decrease in the amount of ore extracted is owing solely to the impossibility of getting the ore transported to the mills, on account of the severe and stormy weather experienced during the week.

LADY WASHINGTON.—Sinking the shaft has progressed very well until last Monday noon, when a heavy body of water was tapped, supposed to come from the old workings of the company, in 1859-60.

GLOBE CONSOLIDATED.—The face of the main west drift at the 400-ft. station is in ground of a much more favorable nature, showing some quartz, and good indications of soon reaching the main ledge.

OVERMAN.—The main west drift at the 1,200-ft. level, is being carried forward at the rate of 4½ feet per day, the rock in face continuing to blast hard and work badly. The air engine and other machinery for driving the header in the face of the drift at the 1,200-ft. level and hoisting from the winze on the 1,000-ft. level, is all in place ready to start up as soon as the air-compressor shall arrive.

CHOLLA-PORTO.—Daily yield for the past week, fifty tons, the assay value of which is \$29 per ton. This was all the ore that could be extracted, on account of the great difficul-

ties encountered in getting the ore to the mills.

ROCK ISLAND.—A heavy flow of water was tapped in the bottom of the winze from the north drift during the week, driving the workmen out and stopping the sinking for the present. At the time of striking the water the winze was in good ore, which bade fair to develop into a fine body. A large three-compartment shaft has just been started, 1,500-ft. east of the ledge.

DAYTON.—The ore breasts on both the second and third levels are looking splendidly. About 40 tons of ore is being sent daily to the Woodworth mill for reduction.

LEO.—Main tunnel still being driven ahead at a good rate of progress into the hill, following the ore vein, which shows somewhat narrower than last week, but of fully as good quality.

NEVADA.—The south cross-cut at a distance of 204 ft. from the main west tunnel has cut through the chimney of ore, showing it to be 57 ft. in width and of an excellent quality. Assays of the ore range from \$20 to \$223 per ton.

UTAH.—A heavy flow of water from the face of the west drift, at the 1st station, accompanied by bad air, has driven the workmen out, and stopped all further progress until the water is drained.

BALTIMORE CONSOLIDATED.—Everything will soon be in readiness to commence the prosecution of the prospecting drifts at both the fourth and fifth stations.

HALE & NORCROSS.—Daily yield of ore, 40 tons; mostly from the old upper levels of the mine.

KNICKERBOCKER.—The water is being drained from the shaft.

SUCCESS.—Sinking the new shaft east of the hill is making rapid progress.

MINT.—The erection of the new hoisting works building, and hoisting machinery, is making as rapid progress as the weather would allow.

SOUTH COMSTOCK.—New shaft to-day down 48 ft. below the tunnel.

WOODVILLE.—Sinking the incline is making good headway. The usual amount of ore is being extracted from both the up-raise and north drift on the 300-ft. level.

CROWN POINT EXTENSION.—Sinking the shaft for the development of this mine will be resumed as soon as the hoisting works are completed.

JACON LITTLE.—The ore development in the lower tunnel still continues its good showing and the best of it is saved up on the dump for milling.

SEGREGATED ROCK ISLAND.—The north drift along the east clay wall of the ledge is still being driven vigorously ahead toward the north line of the claim.

SIERRA NEVADA.—Daily yield, 65 tons, keeping the mill steadily running. The ore breasts are looking well, and the quality of ore extracted during the week shows somewhat of an improvement. A streak of good ore 3 ft. in thickness was developed yesterday, in the face of the west cross-cut from the up-raise in the old Sacramento ground, which seems a good indication of a near approach to the main ledge.

TYLER.—The south cross-cut from the main west drift, at the first station, has been advanced at the rate of 3 ft. per day, running through quartz carrying considerable metal.

SILVER HILL.—The heavy flow of water from the south drift at the second station, is gradually decreasing. The ore body in the north winze has shown a decided improvement during the week.

SUTRO.—The north drift is in 100 ft. During the past week some very fine bunches of ore have been encountered in this drift, assaying as high as \$70 per ton.

INDEPENDENT AND OMOGA.—The new shaft has not yet tapped water, as was expected, and the work progresses well.

BUCKEYE.—The main incline is down to the 450-ft. level, at which point a heavy flow of water was tapped, all that the pumps can handle. The sinking has been stopped, and a new station is being opened at that level for the purpose of drifting to and prospecting the ledge.

JULIA.—The prospecting cross-cuts on the 1,000-ft. level have developed a fine body of good ore, the full extent of which has not yet been determined.

KOSUTH.—The main west drift at the 1st station is still pushed steadily ahead through the ledge, which so far as penetrated prospects finely, giving good promise of the development of a good paying mine.

EUROPA.—The ore passed through during the week shows great improvement in both quantity and value.

JUSTICE.—A splendid new station has just been opened at the 300-ft. level, and another at the 400-foot station. Sinking the main incline below the 400-foot station, for a new level, is making rapid progress.

OCCIDENTAL.—The principal work being done in this mine at present is the repairing and re-timbering of the main adit tunnel.

CALIFORNIA.—The main north drift, on the 1,300-ft. level of the Virginia Consolidated, is still pushed vigorously ahead without change of interest, as is also the south drift on the same level from the Ophir.

ALPHA.—The north drift on that 1,500-ft. level from the Imperial shaft, on Sunday last, cut a body of milling ore the extent of which has not yet been determined, but which gives promise of a fair development.

CHAPIN AND EAST COMSTOCK.—The new hoisting works are nearly completed, and sinking at the bottom of the main shaft will be resumed in a few days.

The Pacific Coast in 1873.

That we have a right to be proud of our coast, none can deny, when they examine our record for 1873. No portion of God's universe has developed greater results. As a city, we have grown in population from 180,000 to 200,000—an advance of eleven per cent. in one year. This advance represents an annual increase of \$15,000,000; and to accommodate this increase, fifteen hundred new houses have been built, which have cost nearly \$6,000,000, and there are all ready projected buildings which will cost \$7,000,000 for this current year. Financially, our city has been wonderfully successful. Money has been plentiful, and trade, commerce and all kinds of business have been profitable. The dividends disbursed by our local and mining corporations foot up, in round figures, about \$16,500,000, and by our Savings Banks, something over \$3,000,000, making an aggregate of about \$20,000,000, or a sum largely in excess of any other city in the United States of anything near our size.

As a State, we have increased in population about 40,000, including a surplus of arrivals over departures of 30,000, and of births over deaths of 10,000. Our specie exports have materially decreased, while our other exports have largely increased. Our exports seaward have increased about \$7,000,000 over 1872, and now aggregate about \$30,000,000; while our exports by rail for the past year foot up, in value, about \$25,000,000—a material increase over the previous year. To improve matters still more, our imports show a slight decrease. Our trade with Great Britain has nearly doubled during the past year, reaching now about \$20,000,000, largely made up in a direct trade in case goods, silks, flour, wines, wood and many other articles of Pacific Coast production, other than wheat. This is truly encouraging to us as a State, and speaks in eloquent tones of material progress.

By taking in our entire coast, we have still greater reasons to feel proud. During the year 1873, our gold and silver mines have produced, as shown elsewhere in this issue, over \$72,000,000—an increase of over \$10,000,000 over the production of 1872; and \$14,000,000 over 1871. Our gold and silver production alone is equal to about \$100 for each inhabitant on our coast.

As the result of all these things, the taxable wealth of our coast has largely increased, and every branch of industry has been strengthened, and the field of operations materially enlarged. Millions of dollars have been added to our commercial, manufacturing and mining enterprises during the year, that will enlarge our future production and greatly enhance our future income. Confidence in our financial system has been strengthened, energy has been infused into our people, enterprise has been awakened, and all have become convinced of our future prosperity and our importance as a great producing country. Our coast is an empire within itself—wealthy, powerful and progressive. We stand almost without a parallel in the world; and still we are only the beginning now of what we will be a few years hence, when our vast plains of rich farming lands are settled up, and our vast mineral resources become more extensively developed—when our cities and towns fill up with large enterprises, as they must at no very distant day.

Then let our people feel encouraged that the old year brought us so much to be proud of, and strive to make the new year more prosperous than the old.—*Real Estate Reporter*.

STORY GRAVEL CLAIM.—From the letter of a correspondent of the *Calaveras Chronicle* we extract the following item in reference to the Story gravel claim in that county: I visited the celebrated Story gravel claim on the Mokelumne river, below Poverty Bar, which is in full blast and paying handsomely. Operations are carried on more extensively in this than any other claim in this portion of the county. The untiring energy and great practical experience in mining operations have placed the owners in possession of a claim of lifelong duration and great wealth. About twenty Chinamen are engaged in extracting the gravel and removing it, by means of a car drawn up an incline by a whim, to a "dump box" where it is washed. Everything moves with the precision and regularity of clock-work. While the bottom gravel is being taken out, averaging about twenty feet in thickness, a hydraulic pipe, throwing several hundred inches of water, is constantly demolishing the upper bank or surface, which we are informed by Mr. Story, who kindly piloted us over the works and explained them to us, pays something above expenses. In facilitate operations a tunnel, 1,200 feet in length, penetrates a hill, tapping the gravel bed about three hundred yards above the old diggings, in which is laid a course of sluices through which the "tailings" are run into the river. There are several other claims in this vicinity, all paying handsomely.

HUMBURG CAMP.—We learn that the miners on Humburg are now all engaged in ground sluicing. They have plenty of water, and an immense quantity of bedrock will be laid bare before cleaning-up time comes round. Water has not been so abundant for the last seven years as it is this winter; and, if the miners in that camp do not get out lots of the "glittering ore" this season, it will not be for want of water.—*Yreka Union*.

OAK BAR.—The high water in the Klamath river has had the effect of temporarily stopping all mining operations in the river claims at Oak Bar, Siskiyou county.

Oroville Mines.

The *Butte Record* says: We feel assured that the people of the county will rejoice in the prospect of lively and prosperous times for Oroville, promised by the discovery of extensive and rich placer diggings on the second bluff south of Oroville, mentioned last week. We learn that the deposit is much more extensive than was at first supposed, and is capable of affording paying diggings for a more numerous population of white miners than the Lava Beds now do for the Chinese miners. The latter diggings are on the flat below the bluff upon which the newly discovered diggings are situated, and cannot be worked by hydraulic pressure. This was the excuse for selling to Chinamen. The discoveries on the bluff beyond the Lava Beds are capable of being worked by hydraulic and sluice, and thus afford ample field for remunerating scientific white labor, and we hope and trust that the field may be occupied by such to the exclusion of the Chinese, who are no particular benefit to the county, and the product of whose labor finds its way within the limits of the great Chinese Wall, instead of being turned into the channels of commerce, and keeping alive the business of the world. We learn that parties have been busy staking off and locating claims during the past week, and that the country for eight or ten miles square, bears evidence of industry in this respect, and the work is still going on.

This section has for years been furnished with a ditch of water for mining purposes, but mostly worked by Chinese in simply rocking over the surface. An abundant supply of water may be had from the South Fork of Feather, (the source of the present ditch), and more fall may be obtained for working the deposit than is afforded by the Oroville bluff, which has been so long and successfully worked. We are inclined to believe that these diggings promise a better yield, more population, and better times for Oroville than the "Gem of the Foothills" experienced in the rainy days of '56 and '57, when the Oroville bluff literally swarmed with miners. The pay deposit lies higher than that of the bluff near Oroville, affords greater fall, and commands equal water privileges, while it is said to be much more expensive. The amount of money that may be taken from these new diggings, is incalculable, and we trust that the advantages afforded by the location for successfully working the mines will be taken advantage of by the laboring white population of the State, and not be turned over to Chinamen, as the Lava Bed diggings were.

PROSPECTING TO THE NORTHWARD.—The *Virginia Enterprise* says: For years there has been a vast deal of prospecting to the southward on the supposed course of the great Comstock lode, but in all this time little worthy of the name of prospecting has been done to the northward on the Comstock range. All that has thus far been done beyond the Utah has been mere surface scratching. Now, however, there seems to be a disposition to set to work in earnest in that region, and several companies will begin operations in good shape this spring. Among these is the North Comstock—not the old North Comstock of former days wherein Mark Twain saw great chunks of pure silver, but a mine lying in an altogether different direction. The North Comstock, whereof we now speak, was in the early days known as the "Indian Queen." It lies to the northeast of the Utah, and there are on it some old works. Among these is a shaft 95 feet in depth, and an old tunnel about 40 feet in length. The present owners have four men at work grading off the ground preparatory to sinking a large three-compartment shaft, which will be put down as speedily as possible. This shaft will be sunk about 30 feet east of the lead, which it will cut at the depth of 200 or 300 feet, where it is expected to find good ore. The ore in the bottom of the old shaft assays from \$10 to \$13 per ton. The work now being done is under the superintendence of G. Williams.

THE K K MINE.—We have received the following information in regard to the above named mine. A fine body of ore is being worked in the Marceline location, extending in the old ground of the company from the first to the second levels, over one hundred feet, all paying ore, and a drift started in the main shaft from the third level 311 feet from the surface, for the purpose of striking the south ore body. The Skylark shaft, situated six hundred feet north of the main shaft, is being rapidly developed, and from appearances one of the best bodies of ore yet discovered in the mine will be opened. There are about forty men at present working in the different portions of the mine engaged in the further development of the different bodies of ore. The hoisting works of the company are as fine as any in Eastern Nevada, having been erected at a cost of \$30,000. The cages of the two shafts are provided with patent safety clutches and are run with flat English wire cables. The engine is sixty-horse power, and is from the house of Booth & Co., San Francisco. As soon as the spring fairly opens the company intends putting on a large force of men in the mine.—*Eureka Sentinel*.

SINGLE TRACK RAILROAD.—We have received from Mr. Crawford, of the Grand Hotel, a photograph of a singlerail railroad locomotive, spoken of last week. A model of this railroad, which is now being operated in Philadelphia, is also exhibited by Mr. Crawford.

CHERRY CREEK.—Johnny Emsnell, just in from cherry creek, states that, although drill times now prevail, no doubt is entertained of great activity in the spring. Many mines are being worked to as great an extent as the recent miserable weather will permit, and miners generally are jubilant over the future of their respective claims. We saw that the Chance mine has been incorporated, a notice of which appears in another column, and the owners have purchased a mill-site and water-right, near the town, and will soon move the splendid mill of the Tehama Company, erected at Shalburn to the spot. The Geueva and Teacup properties are being developed rapidly with good results, and ores from them are being packed to the mill at Egan Cañon, under lease to John R. Murphy and associates. Building is progressing, and new houses are constantly being added to the present large town. Many of our Hamilton friends and townsmen have established themselves in business at Cherry, and are all satisfied with their prospects. We anticipate that this new camp will prove a valuable auxiliary to the county seat, and assist very materially in bringing White Pine once more favorably into notice. There can be no doubt that the coming summer will demonstrate the fact that we are not all dead yet, and that our mineral resources are equal, if not superior, to any in Nevada. All should rejoice in the prosperity of every section of the county, even though its direct effects are not immediately apparent to people remote from the exact locality, as everything of a successful nature helps to forward all our interests indirectly.—*White Pine News*.

SANTA CRUZ COAL MINES.—A writer in the *Oakland Transcript* says of the coal beds of Santa Cruz county: There are five mines located and in process of development: The Forest Coal Mining Company, on Soquel creek, which runs into Monterey Bay; the Clifton, east of the Forest; the Commercial, northeast of the Clifton; the Black Mountain, west of the Commercial; the Thompson Company, the works lying west of the Black Mountain. These are the localities. The Forest mine crops out on a slide, and has been prospected by means of a tunnel, some 600 feet into the mountain. The Commercial mine is on what is technically called a "break," from the main Black Mountain; here explorations have been extended some 300 feet, through sandstone and slate, developing the finest quality of bituminous coal. These mines are located on Soquel creek, only eight miles from Soquel Landing, on Monterey Bay, with an easy grade for a railway. The companies own some 3,000 acres of the best timber lands, which are thickly overgrown with redwood, fir, tan-bark oak, and other valuable woods. This land is now worth \$100 per acre, and includes several water-powers, suitable for mills or factories. These several companies are under the general superintendence of Wm. Strader, who is thoroughly acquainted with the business of mining for coal.

WHITE PINE BULLION.—The *White Pine News* says: Through the politeness of W. P. Willard, cashier of the White Pine County Bank, we learn that from June 1st, 1873, to the present date, there has been shipped through his hands \$160,000 in silver bullion. The Eherhardt & Aurora company alone have shipped \$80,000 in bullion since starting their new mill on Dec. 12th. This is not so bad a showing for a "played out" district. It is well to remember that up to the first of last June not a pound of bullion was shipped for a period of nearly ten months. Undoubtedly this showing will be sensibly increased during the coming year, and we may well predict much larger figures when the Hidden Treasure and Ward Beecher companies resume active operations. Should the Trench mine owners form a consolidation with the Monte Cristo mill, they will be enabled not only to crush their own ores but do considerable custom work now sent to Eureka, thus largely increasing our bullion product. The Newark mill is also in White Pine county, a fact which seems to be forgotten by our Eureka friends, and their hullion must be added to the general production of the county. Altogether, we can see no reason to complain of the outlook in the future, although the present times appear dull enough.

PINE FLAT MINES.—Yesterday, says the *Healdsburg Flag*, we met M. J. Wilkinson, who is interested in the Pine Flat mines. He informs us that there are about two hundred men working and prospecting in the mines of that region. Pine Flat is growing to be quite a town. The Thompson brothers have a store established there, as already mentioned in our paper, and a gentleman from Sacramento is about to build a hotel there. The owners of the mines have great confidence in their discoveries. Mr. Wilkinson also says that all the people residing in the quicksilver country are desirous of having a good road built immediately, to connect their place with Healdsburg, for purposes of trade. They have no faith in the twenty-two mile road to Calistoga, because they know that they can get to Healdsburg by a more direct and natural route of only sixteen miles. Let the people of Healdsburg, then, see that this road is built immediately.

As a means of avoiding explosions in the use of hydrogen apparatus, Fresenius says the gas may be passed through a tube containing a number of small discs of fine wire placed between cotton.

The Burleigh Drill.

The Cedar Creek company over at Dutch Flat are running a tunnel from Bear river under the celebrated gravel deposit at or near Dutch Flat, to reach that deposit deeper down than heretofore and extract the millions of gold known to exist along the bed-rock of that ancient river-bed. The tunnel is to be 3,000 feet long, and as extensive duties will be required of it, the size will be large—8 by 8 in the clear. By the common hand-drill process, nine men averaged 13 feet per week, working three shifts, a little over two feet in twenty-four hours. With the Burleigh drill and a force of five men they are now averaging eight feet in twenty-four hours and the cost per foot is reduced fully 50 per cent. One of our reporters was over there the other day and was surprised and delighted with the performance of this drill. It is run by compressed air and the beauty of this power is that it can be used several miles away from the point of compression and serve as the very best ventilator for underground operations known. While there, our reporter timed the drilling of two holes with the following result: No. 1, 23 inches in four minutes; No. 2, 19 inches in three minutes. The drill strikes from 200 to 300 blows per minute.

This tunnel is now in 315 feet and at 600 they expect to commence taking out gravel through a shaft and making it pay.

There are immense gravel ranges all along that scope of country, including You Bet, Little York, Steep Hollow and the head of Greenhorn, as well as in many other portions of the county, and the only thing in the way of their being worked and large fortunes made therefrom, is the depth at which the bed-rock lies and the great cost of running tunnels to tap them below the gold deposits. By the formation of large companies and the use of these machine drills great numbers of these rich and extensive ancient placers will soon be opened up, and the world's supply of the wherewith to bring all nations together as one people, by encouraging progress in arts, science and invention, be greatly augmented.—*Foothill Tidings*.

PEAVINE DISTRICT.—A private letter now before us from Poe City, Peavine mining district, speaks very hopefully of some of the principal leads in that region. The writer says that work has again been resumed in the Paymaster mine, this time under the superintendence of Billy Bourne, who seems to thoroughly understand his business. The Golden Fleece company are sinking a shaft in their tunnel. This shaft is now down twenty-five feet, all the way in soft rock. They are about letting a contract for sinking the shaft a further distance of twenty-five feet. From present appearances, they expect to find paying ore at the depth of one hundred feet, and a wide ledge. They are now saving ore from the shaft with the intention of having it crushed as soon as they can get it hauled to a mill. Good quartz is also being encountered in the Bull's Head lead, a gold-bearing vein. A contract has been let and work will soon be commenced on the Hopkin's mine, under the superintendence of W. D. Darnell, of this city. The writer appears to think that they have mines in Peavine, from which they can take more pay rock than is being taken from the Consolidated Virginia, Ophir, Justice, Caledonia, or almost any of our Comstock mines except, perhaps, the Belcher and Crown Point. The opinion of such of our mining men as have examined the Peavine mines have not been quite so favorable as this.—*Enterprise*.

VALUE OF SILVER.—At one time it was feared by the owners of mines on this coast that silver would decline in value in European markets to such an extent as to affect injuriously the mining interest. The aspect of affairs has now changed, for not only is there a disposition to use more silver coin by several European Governments, but an increased demand for silver is springing up in India, which has caused a rise in the price of the commodity. A London circular of a recent date contains the following: The great rise in the exchanges reported from India has caused a large increase in the orders for silver for that country, and a consequent advance in the price. Purchases were made up to the 17th instant at 59d. per oz. standard; but on that day large orders were executed at 59½d. per oz. standard; and this may be considered as the present rate. A large part of the recent supplies has come from Germany, but the stock of silver in that country is very firmly held, and there is no apparent intention to sell any very important amounts. Austrian florins have been sold at 57½d. per oz., their intrinsic value as compared with bar silver; they have been taken for coinage purposes in India.

STICKEEN RIVER.—A Portland, Or., despatch has the following: The steamer *California* arrived from Sitka Sunday. She brings but little intelligence regarding the Stickeen mines. One hundred and sixty men left Fort Wrangle on the 3d and 4th inst. for the mines. The ice was in splendid condition for traveling, and every one left in excellent spirits. The excitement is daily increasing. The *California* sails on Wednesday, and will take a large number of passengers and a large amount of freight for Fort Wrangle.

USEFUL INFORMATION.

OILS FROM SEED.—The vegetable oils that may be produced in the United States are those from cotton seed, linseed, olive, hemp seed, rosin, sunflower, castor bean, rapeseed, peanut, poppy seed, and colza. All these seed oils are prepared from seed first crushed between heavy rollers, and then ground between two pairs of granite stones five to seven feet in diameter, which are made to turn upon their axes while traversing a circular path. The soft pulp thus supplied is inclosed within a woolen sack, and this again within an outer horsehair sack, and then exposed to immense pressure by means of heavy wedges, each about 600 pounds weight, which are forced into cases just fitting the sacks by the action of cams upon a horizontal shaft. The oil thus expressed is known as "cold drawn." Afterward the cake is pressed between heated plates, and an inferior quality of oil is expressed from them. The olive is successfully grown on the island of St. Simons, near the coast of Georgia, and five gallons of oil have been produced the past season from each 250 trees. The fruit is subjected to pressure sufficient to crush the seed, and the oil expressed falls into cisterns upon water, from which it is skimmed. This finest quality is called virgin oil. Second and third qualities are procured by the aid of hot water and heavier pressure. Poppy oil greatly resembles olive oil of the finest quality, and is used to adulterate it. Thirty per cent. of oil may be extracted from poppy seed, which, when boiled, is equal to linseed. Cotton seed oil is largely used to adulterate olive oil; in fact, it is bottled in a pure state, and labelled with the foreign title of *huile vierge* (virgin oil), and sold as the best salad oil from olives. Cotton seed oil is again adulterated with rosin oil. The manufacture of seed oils is one that might be made to contribute to the variation of our farm crops, and also to return to the soil in the refuse cake, either directly as manure or indirectly as feed for cattle, a large amount of fertilizing material.—*Tribune*.

GILDING GLASS.—Gilding glass can not be patented—every one may do it; but the manner how is subject to a patent. Such is Schwarzenebach's method. He dissolves pure gold in aqua regia, and evaporates till crystallized, in order to free it from the acid. Then it is dissolved in pure water and filtered. The solution must contain 2 grains of metallic gold to the pint of water; add soda till alkaline. Then prepare the reducing solution by saturating alcohol with sulfid gas, and adding an equal volume of pure water. Take two glass plates, and clean them as carefully as a photographer does for a picture; place the cleaned surfaces together at a distance of one-eighth of an inch in horizontal position, with the largest plate below; mix the two liquids and bring them between the plates, which is readily accomplished by their capillary action; leave them two or three hours, and when they are removed, the gold will be found reduced and deposited on the glass, washed and varnished. Such is the method patented, but we would suggest to take a single plate well cleaned, placed perfectly horizontal, the edges greased so as to prevent the solution from running off, and then covered with the freshly mixed liquids to the height of about one-eighth of an inch, in the same way as plated glass mirrors are now silvered by means of a reducing silver solution.—*Manufacturer and Builder*.

CARE OF VARNISH BRUSHES.—Brushes used for applying finishing varnishes should be cared for with the utmost pains, as good work depends much upon the good condition of the brushes. A good way to keep them is to suspend them by the handles in a covered can, keeping the points at least half an inch from the bottom, and apart from each other. The can should be filled with slow drying varnish up to a line about a sixteenth of an inch above the bristles or hair. The can should then be kept in a close cupboard, or in a box fitted for the purpose. As wiping a brush on a sharp edge of tin will gradually split the bristles, cause them to curl backward, and eventually ruin the brush, the top of the can should have a wire soldered along the edge of the tin turned over, in order to prevent injury. Finishing brushes should not be cleaned in turpentine, except in extreme cases. When taken from the can, prepare them for use by working them out in varnish, and before replacing them cleanse the handles and binding with turpentine.—*Am. Homestead*.

CLEANING BARRELS.—The rancid grease wherewith ancient barrels are saturated is very frequently the cause of the tainting of the meat. This may be removed by scalding the barrels with boiling water and a few handfuls of wood ashes, or one handful of concentrated lye. A brisk scrubbing with a stiff corn broom and a rinsing with hot water, followed by another with fresh cold water, will render these barrels sweet. But on no account should a meat barrel be defiled by using to scald hogs in. There is in such an act a departure from that virtue which comes next to godliness.

A NEW APPLICATION OF GYPSUM.—Gypsum mixed with 4 per cent. of powdered marsh-mallow root will harden in about one hour, and can then be sawn or turned, and made into dominoes, dice, etc. With 8 per cent. of marsh-mallow, the hardness of the mass is increased, and it can be rolled out into thin plates, and painted or polished.

PREVENTION OF BOILER EXPLOSION.—The daily papers contain all kinds of suggestions in regard to this subject, as that certificates of inspectors should accompany bills of sale, that the seller should be made liable for all damages resulting, that the maker should be punishable if damage was the result of defective construction or design, etc. This is all nonsense. Simply let all those who use a steam boiler employ an engineer who knows as much, or more about it than a boiler inspector; and this indeed is not requiring a great deal. If it is objected that such men require too high salaries, it is simply caused by the fact that there are not enough of them. Increase the supply by proper and more universal instruction in the right kind of subjects, and the price will come down to a reasonable standard, say \$5 or \$6 a day; and it is worth all that, if it guarantees us against such losses in life, limb, and property as we have had to deplore during the last few years by unpardonable boiler explosions.—*Manufacturer and Builder*.

CLEANING SILVER-WARE.—A freshly made solution of hyposulphite of soda will often wash off at once any thin dark film which silver is apt to be covered with when exposed to the air. If the coating is thick, the silver must be left immersed for half an hour in this solution, to which some ammonia may be added. When taken out, wash in water, dry, and rub with leather and Paris white. For spoons, forks, and small plate, boil them for 20 minutes in water containing some carbonate of potash and Paris white; let them cool in the liquid, take each piece out, and rub it with soft leather. For the embossed and engraved parts use a soft brush.—*Journal of Chemistry*.

PARISIAN WOOD VARNISH.—To prepare this varnish, which has been long celebrated, Graeger dissolves 1 part of good shellac in 3 or 4 parts of alcohol, of 92 per cent. (by volume) on the water bath, and cautiously adds distilled water, until a curdy mass separates out, which is collected and pressed between linen; the liquid is filtered through paper, all the alcohol removed by distillation from the water bath, and the resin removed and dried at 100° until it ceases to lose weight; it is then dissolved in double its weight of alcohol, of at least 96 or 98 per cent., and the solution perfumed with lavender oil.

HYPOCHLOROUS ACID FOR BLEACHING.—De-mailly has invented a method for manufacturing hypochlorous acid gas for bleaching purposes. The apparatus consists of a vessel for the generation of chlorine, connected with a vertical tube, which may be heated, which is filled with balls of terra-cotta impregnated with some sulphate, as potassic, sodic, magnesian, etc. Under the influence of the heat and the presence of the chlorine, an acid sulphate forms, half the chlorine is fixed as a chloride, and the oxygen of the base unites with the other half of the chlorine, forming hypochlorous acid; at least such is the reaction as described.

ETHER GLUE.—An excellent liquid glue is made by dissolving glue in nitric acid. The ether will only dissolve a certain amount of glue, consequently the solution cannot be made too thick. The glue thus made is about the consistency of molasses, and is doubly as tenacious as that made with hot water. If a few bits of india-rubber, cut into scraps the size of buck-shot, be added, and the solution be allowed to stand a few days, being stirred frequently, it will be all the better, and will resist the dampness twice as well as glue made with water.

SCREWS IN PLASTER.—It often becomes desirable to insert screws in plaster walls without attaching them to any woodwork; but when we turn them in the plaster gives way, and our effort is vain. And yet a screw may be inserted in plaster so as to hold light pictures, etc., very firmly. The best plan is to enlarge the hole about twice the diameter of the screw, fill it with plaster-of-Paris, such as is used for fastening the tops of lamps, etc., and bed the screw in the soft plaster. When the plaster has set, the screw will be held very strongly.

An improved packing for steam-engines, pumps, etc., is composed of fibrous strands into which melted paraffine, stearine, or other lubricant, with a suitable powdered substance, is introduced during the plating of the strands, in order that the fibers be thoroughly impregnated. The fibrous material is hemp. The braid at or near the point where the different strands are interlocked passes through an opening in a plate, when the strands are condensed and the braid rendered uniform in thickness.

HARD PLASTER.—To a thin milk of lime or lime-water add ten or fifteen drops of liquid silicate of soda for every pint of fluid used; this is then thickened with plaster to a thick cream. Plaster thus prepared, will set in five minutes or thereabouts, according to the thickness of the cream. If too much silicate is used, the soda will effervesce on the surface, and spoil the sharpness of the impression.

BLACK BRANDINO INK.—Triturate together 1 part of pine soot and 2 parts of Prussian blue with a little glycerine; then add 3 parts of gum-arabic and sufficient glycerine to form a suitable paste.—*Jour. of Chem.*

COMMON CAST IRON.—or iron in any form, may be plated with tin by cleaving with acid, dipping in zinc chloride, and then in a bath of melted tin.

GOOD HEALTH.

Eat Slowly, Please!

Now do not suppose we are going to drag you back two or three centuries and parade the virtues of our great, great-grandfathers, who were wont to spend two or three hours over their meals, before your eyes, for we are not; simply because the doctors and life insurance tables prove that, with all our dyspepsia and indigestion, we live longer and suffer less from the gout than they did. Only apply the same common sense to your eating and drinking, that you do to the ordinary business affairs of life, and do not require of a thin, muscular sack the work for which nature has provided a complete apparatus of the very hardest material in the whole human frame. Masticate your food thoroughly; thereby securing the advantages of fully appreciating the savory odors and taste of your food, completely triturating and mixing it with the saliva, and of furnishing it to the stomach in such quality and at such a rate that this organ shall be able to appreciate the proper quantity, and tell you when you are "done."

Hunger is a purely reflex action; the want of material to properly conduct its labors is felt all over the whole system, but referred by means of the great sympathetic system to the point from which supplies are usually furnished—the digestive tract; which includes the stomach and upper portion of the small intestines. Now, when the stomach has received a sufficient supply for the wants of the system, the fact is announced by means of this same sympathetic system to the millions of millions of little chemical laboratories which make up the whole of the "human form divine," and the demand ceases, and "we have had quite enough, thank you." But, when we tumble food in the stomach almost at the rate at which a Mississippi river elevator conveys wheat into its spacious reservoirs, how can we expect our stomachs to be able to take cognizance of the amount, and proclaim "enough" at the proper time? Besides if we try to swallow a doughnut, gulp half a cop of tea, masticate a good-sized piece of beef-steak and tell the cook to "hurry up with those potatoes" all in the same breath, the chances are greatly in favor of our getting seriously choked; and having to submit to the partial dislocation of our spinal column at the hands—don't mind us, too—of our frightened better half before getting relief. And choking does not always end so favorably; it sometimes kills. We recall a case now that occurred in our student life, which is exactly in point.

The body of a brawny, muscular man, who had died quite suddenly, by one of those dexterous manipulations known only to medical students, found its way to the dissecting room of a well-known college. The doctors had puzzled their brains in vain trying to determine the cause of death, and had turned the "subject" over to the class for dissection. Being a remarkably well-developed, muscular man, it was voted to appropriate him to illustrate the various operations in surgery. Accordingly, scalpel and amputating knife were soon busily at work; and limbs were amputated, arteries ligated, joints resected and disarticulated until nothing was left that seemed to afford any chance for any further operations; when one of our number suggested "tracheotomy." No sooner said than done. The delicate rings of the trachea were quickly divided by the "direct thrust," when, lo! the cause of the mysterious death was at once apparent. Filling almost the entire cavity of the larynx, completely occluding the chink of the *rima glottidis*, and extending some distance down the trachea itself, was a roll of half-chewed food; emitting off his supply of "wind" far more effectually than ever did hangman's rope. The struggle for life had been a terrible one; the powerful muscles of inspiration having forced the obstructing food into the trachea so firmly that it seemed as though it had been "tamped" there.

Now, don't get alarmed and refuse to eat at all because of this little incident, for that is not the object of this article; but put your trust in providence, eat slowly, stop when you feel satisfied, and enjoy the luxury of an undisturbed digestion.

TO REMOVE BOILS.—Dr. Simon, a physician of Lorraine, gives a new cure for boils, by treating them with camphorated alcohol. As soon as the culmination point of a boil makes its appearance, he puts a little of the liquid in a saucer, and dipping the ends of his little fingers in it, rubs the inflamed surface, especially the central part, repeating the operation eight or ten times for about half a minute. He then allows the surface to dry, placing over it a slight coating of camphorated olive oil. He says that four such applications will, in almost all cases, cause boils to dry up and disappear. The application should be made at morning, noon and evening.

TREATMENT OF CHILBLAINS.—Sulphurous acid should be applied with a camel-hair brush, or by means of a spray-producer. One application of this usually effects a cure. The acid should be used pure. A good wash for hands or feet affected with chilblains is sulphurous acid, three parts; glycerine, one part; water, one part. The acid will be found particularly useful in the irritating, tormenting state of chilblains.

FISH AND TEA AS FOOD.—The London *Times* sharply controverts the assertion made by Dr. Edward Smith to the British Association, that fish is rather a relish than food, and contains little more nutriment than water. As opposed to this statement the investigations of M. Payden are cited, who proves that the flesh of fish on the average does not contain more water than fresh beef, and has as much solid substance as the latter. For instance, the flesh of salmon contains 75.50 per cent. water and 24.296 per cent. solid substance, while beef (muscle) contains 75.89 per cent. water and 54.12 per cent. solid substances. The flesh of herring contains still less water than that of salmon, and evoe flat-fish are as rich in nitrogenous substances as the best wheat flour, weight for weight. Another statement made by Dr. Smith, that the amount of nutriment contained in an ounce of tea is infinitesimal, is met with the assertion that, while tea is no "nutriment" in the ordinary sense, the individual who takes tea after his meals feels, without being able to define it, that tea has a favorable effect upon certain highly important functions in his body, that digestion is accelerated, and facilitated, and his brain work benefited thereby. Though not nutriment, tea is thus alleged to possess a really higher value, in medical properties of a peculiar kind.

DIFFERENCE IN HUMAN EXHALATIONS.—It is a well-known fact that the human body contains in itself various humors and acids similar in action and having the same tendency toward the baser metals, as nitric and sulphuric acids; namely, to tarnish them, these acids varying in quality in different persons. No better proof need be given in support of this than in noticing the effect which different persons have on the jewelry which they wear. There are thousands who—for fancy or economy's sake—wear continually the cheaper kind, known under the name of "fancy jewelry," having brass ear-wires to the drops, without any ill effect, while many others, after wearing them a few days, are troubled with sore ears; in other words, the acids contained in the perspiration of some persons are sufficient to act upon the brass. There are persons by whom jewelry of any grade below 18 karats fine would be tarnished in a few days, and if such persons were to condemn all jewelry they thus tarnish as brass, they would do great injustice to the jeweler. These are extreme cases, it is true, but there are many persons who cannot even wear iron or steel about them without causing it to rust by the acidity of their perspiration.—*Exchange*.

OUR FLANNELS.—The value of flannel next the skin can not be overrated. It is invaluable to persons of both sexes, and all ages, in all countries, in all climates, at every season of the year, for the sick and the well. In brief, I can not conceive of any circumstances in which flannel next the skin is not a comfort and a source of health. It should not be changed from thick to thin before the settled hot weather of the summer; which, in our Northern States, is not much before the middle of June, and often not before the first of July. And the flannels for the summer must not be three-quarters cotton, but they must be all woolen, if you would have the best protection.

In the British army and navy, they make the wearing of flannel a point of discipline. During the hot season the ship's doctor makes a daily examination of the men at unexpected hours, to make sure that they have not left off their flannels.—*To-day*.

HOW FAR CHEMICAL WORKS POISON THE AIR.—Sulphuric acid does not remain, any perceptible time as a gas when it comes into the open air. Muriatic acid will go several miles, and sulphurous acid goes farther, but is diluted more rapidly, and therefore is less perceived. Chlorine will go four miles and be quite distinct to the smell, if the ground be smooth, but if it be roughened by trees or vegetation the trees obstruct the motion of the air and gases, and the absorbable portion is removed; but not without damage to vegetation. Chemical works generally are greatly on the increase, and the power to repress escapes of gas does not increase with them. When new manufactories are proposed, the air should be examined, and if the air be injured to a certain extent, no more of the same manufactories should be allowed at the same place.—*Ex.*

HOT SAND BATHS.—One of the most attractive therapeutical novelties for some time past in London—recently introduced from the continent—consists in the erection of establishments for administering hot sand baths as a remedy for rheumatism, recent cases of nervous disorders, affections of the kidneys, and all cases where heat is needed as the chief remedial agent. The advantages claimed in behalf of this method of treatment are, that it does not repress respiration, like the hot water bath, but rather increases it, and does not interfere with respiration after the manner of the steam bath or the Turkish bath. It is found that the body can endure the influence of this kind of bath for a much longer time, and a much higher temperature can be applied.

ALLEGED CURE OF LEPROSY.—The *Friend of India* reports that the Madras surgeon in medical charge of the penal settlement at Fort Blair believes he has made a valuable discovery in the cure of leprosy. He is of opinion that leprosy can be cured by the oil of the gurjun tree. Every leper in the settlement is, it is stated, being cured fast of this loathsome disease. In no case has there been the slightest failure, and the disease has been arrested at every stage.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—An Improved Mill
Pick; Gas Bracket Match Safe; The Colombian
Mines, 129. Copper Mining Legislation; Chrome
Steel; Artificial Rain; Mine Ventilation, 136. Fish
Culture; University of California; Agricultural Chem-
istry, 137. Mines and Mining—No. 1; Miners
Blinded; Patents and Inventions, 140.ILLUSTRATIONS.—Gas Bracket Match Safe;
Cummings' Mill Pick, 129. Fish Culture, 137.CORRESPONDENCE.—Ore Beds—Their Origin
and Condition; A Happy Time at the Richmond,
130.MECHANICAL PROGRESS.—English Printing
Presses in America; Improved Explosive Engine;
Innovation in Carpet Manufacture; Proposed Tunnel
between Scotland and Ireland, 131.SCIENTIFIC PROGRESS.—Latest News from the
Sun; When Chemists Disagree who shall Decide?
Combustion and its Products; New Photographic
Process; The Use of Dynamite; Red and White Mus-
cles; Poisoning by Silk, 131.MINING STOCK MARKET.—Table of Daily
Sales and Prices and Comparative Prices for the Week;
Notices of Assessments; Meetings and Dividends;
Review of Stock Market for the Week, 132.MINING SUMMARY from various counties in
California and Nevada, 132-3.USEFUL INFORMATION.—Oils from Seed;
Gilding Glass; Care of Varnish Brushes; Cleansing
Barrels; A New Application of Gypsum; Prevention
of Boiler Explosions; Cleaning Silver-Ware; Parisian
Wood Varnish; Hypochlorous Acid for Bleaching;
Ether Glue; Screws in Plaster; Hard Plaster; Black
Branding Ink, 135.GOOD HEALTH.—Eat Slowly, Please! To Re-
move Bile; Treatment of Chills; Fish and Tea
as Food; Difference in Human Exhalations; Our
Flannels; How Far Chemical Wares Poison the Air;
Hot Sand Baths; Alleged Cure of Leprosy, 135.MISCELLANEOUS.—The Cassiar Mines; Paying
the Lawyers, 130. The Pacific Coast in 1873; Storey
Gravel Claim; Humbug Camp; Oak Bar; Oroville
Mines; Prospecting to the Northward; The K. K.
Mine; Single Trade on Railroad; Cherry Creek; Santa
Cruz Coal Mines; White Pine Bullion; Pine Flat
Mines; The Burlingh District; Peavine District; Value
of Silver; Sticksen River, 134. Trinity County
Mines; Sargent's Mineral Land Bills; The New Almaden
Mine; Mining Accident; The Southern Mines;
Klamath County Mines, 133. Belmont; Miners
Blinded; Mines on Gold Island; Eureka Bullion;
Shipping Barley East; Charcoal and Tar as a Surgical
Dressing; Cinnabar; Mining Suit, 139.

Copper.

We make the following extracts from James
Lewis & Sons' monthly report on ores and
metals (Liverpool), for the benefit of our read-
ers interested in the copper market. The re-
port is dated the 31st ult., and gives a discour-
aging view of the market for the month, values
having declined from the 1st of the month in
the face of a reduction in the bank rate to 3½
per cent. Two large failures in the lead trade
have tended to increase the dull feeling which
already existed among the purchasers of cop-
per. The sale of bars amounted for the month
to about 3,400 bars, at £84, down to £81 cash
for good. Ordinary brands (including Lota
and Urmenta) from £86 down to £83 for picked
brands. At the close values were about 10s per
ton better from the lowest point with an im-
proved demand.

The sale of furnace material for the month,
consisted of the Swansea Ticketing of the 6th
and 7th ult. The average price at the former
being 15s 0¼d per unit for an average produce
of 14 per cent., and at the latter 15s 2d for 18
per cent. The Cape ore realized 16s 5¼d and
16s 2d at the respective Ticketings; 250 tons
of Chili ore sold on the 10 of January at Swan-
sea, at 16s 7d per unit, and 200 bars Regulus
on the 22d, at 16s 6d. On the 30th, 1,250 tons
of Regulus brought 16s per unit. Latest quo-
tations are: Ore and Regulus 16s per unit;
Bars, good ordinary brands, £81.10s to £82;
picked brands, £82.10s to £83.10s; special
brands, £84 to £85 per ton.

Chili exports to 30th of November, including
that loading on that date and that chartered to
1st of January, were 46,812 tons, as against
51,354 in 1872, 46,751 in 1871, and 53,569 in
1870. Stocks of West Coast produce were es-
timated at 20,063 tons fine, against 20,604 tons
on the 1st of December.

THE drain tunnel in the Caledonia mine,
1,050 feet long, was completed in 92 days, or
at the rate of nearly 11½ feet per day; an ex-
tent of work which considering the length of
time occupied has never been excelled on the
Comstock.

Mining Legislation.

At almost every session of Congress it is con-
sidered the proper thing to have some little
legislation with respect to mining. Likewise
at every session of the State Legislatures laws
are framed which have an influence more or
less on the mining interests. Unfortunately,
however, the men who introduce these laws
do not know anything about the subject; and,
still more unfortunately, they think they do.
The miners themselves want to be left alone;
they have an abhorrence of lawyers, very natu-
rally, we may say, and do not wish any mea-
sures taken which will bring them in business
relations with the disciples of Blackstone. It
is well known that lawyers who enter upon
mining suits expect, and usually get, an un-
usually large fee. If we were to add together
all the sums paid annually for "legal ex-
penses" by our prominent miners, this amount
would astonish even the legal fraternity itself.

As long, however, as the expensive luxury of
employing lawyers is only incumbent on the
owners of rich mines, the common miner has
little to complain of. But when, as is proposed
by one bill now pending in Congress, every
miner in the land must patent his claim,
whether he wants to or not, the miners begin
to "get their backs up," and "want to know,
you know." It costs from \$250 to \$1,000 to
patent an ordinary claim. Very few claims
can be patented for \$250. The assistance of a
lawyer is required to accomplish the feat of
procuring a patent, and of course he will not
work for nothing. The law of May 10th, 1872,
specifies the details of making a location cor-
rectly, but only few take the trouble to comply
with all the requirements. This may seem
like a "thin" statement, but a lawyer of this
city, who has taken out a number of patents
under the law of 1872, informs us that not
more than one in twenty have complied with
the law sufficiently in detail to procure a
patent for their ground with facility. In many
cases the claims have had to be formally re-
located.

Now suppose this bill we refer to were to
pass, and everybody had to patent his claims.
It would take away a large proportion of the
money on the Pacific slope, to pay these bills
at the expiration of the year. Prospecting would
cease entirely, as very few could expend \$500
on a claim and patent it within one year. Wait
until a mine has proved that it is worth patent-
ing, before compelling its owner to patent it.
This is not the first attempt to enact a "com-
pulsory patent" law, and it is to be hoped that
it will be choked off, as were its predecessors.

In our own State the most absurd bill in-
troduced is that known as the "quicksilver bill," to
which we have several times alluded. It pro-
poses to regulate the price of quicksilver in
California at 35 cents per pound. The passage
of this bill would establish a dangerous prece-
dent, for the price of other articles of domes-
tic produce could also be regulated. It is con-
tended, however, that this bill is justified on
special grounds, because a few men have con-
trol of the quicksilver market. In that case,
however, it is based on false premises, for such
is not the fact. There was a quicksilver mono-
poly controlling the three producing mines
of the State; but these three mines are no longer
isolated in position. Many others have been
discovered and developed, and are now produc-
ing mines. They are not as yet equal to the
Almaden, Redington and New Idria mines,
but a few of them bid fair to be so. They are
owned by different parties, who sell their pro-
duct to whom they wish, and the present high
price is simply to be charged to increased con-
sumption and decreased production. If the
legislature can regulate the laws of supply
and demand to satisfy all parties, they may be
able to settle this quicksilver business, but bet-
ter means must be adopted than those propos-
ed. We notice with surprise that this bill has
been reported on favorably, by the committee
on Federal Relations. If passed, however, it
would soon be repealed as either unconstitutional
or inoperative.

Various bills are now pending at the legisla-
ture on the subject of stock gambling and tend-
ing to suppress it, but we very much doubt
whether any of them will ever amount to any-
thing. Those to prevent the salting of mines
would be of benefit if they were enforced, but
there are laws in existence against fraud, which
would cover these cases, yet they are seldom
brought to bear upon them. We give in an-
other column the bill introduced by Senator
Sargent, which will be of interest to our readers.

OAKLAND HARBOR.—It will be seen by refer-
ring to our list of "New Incorporations" in
another column, that a company has been or-
ganized for the purpose of improving the har-
bor of Oakland. It is probable that this com-
pany are taking up the matter only in case the
Government fails to grant the appropriation
asked for to improve the harbor. If the plans
of the Government engineers are carried out,
the appropriation of \$250,000 which is asked
for will not do more than half the work. The
new company will hardly commence operation
before the appropriation question is settled by
Congress.

HEAVY YIELD.—In two years and seven
months the Crown Point and Belcher mines,
on the Comstock lode, have produced 624,302
tons of ore, yielding \$35,041,823; or an average
of \$56.12 per ton. The Belcher yield was \$18-
272,965 from 284,327 tons—an average of \$65
per ton.

Chrome Steel.

This steel is an alloy of iron and chromium.
The latter metal has hitherto been used almost
exclusively in its chemical combinations for
paints, enamels, etc. Recent discoveries
enable the metallurgist to reduce it to its
metallic state and place at his command a
metal having most wonderful properties. It is
very hard, brittle, non-oxidizable and of a
silvery whiteness. When alloyed with iron, it
produces a homogeneous steel of a degree of
hardness depending upon the proportions of
ingredients and having very peculiar prop-
erties. This steel is made by the Chroms Steel
Company, of Brooklyn, N. Y.

This claims made for this steel by the man-
ufacturers are novel, and as the experience of
those who have used it would seem to confirm
all that is claimed for it, it certainly is a very
valuable substance and one particularly adapt-
ed to the wants of this coast, where so much
mining is carried on. The makers claim that
this steel can be used for any and all purposes
to which any other steel is applied; whether as
a machine shop tool, a rock drill or pick,
a heavy locomotive spring or a fine
edge tool; it will do at least 50 per cent. more
work in that capacity than the best brands of
carbon steel. The next advantage is that it is
perfectly uniform in quality in each grade.
This property has been the desideratum among
steel manufacturers, ever since steel was first
made. It is easy of accomplishment in this
case, as the substance is simply an alloy of
metals, the quality being regulated as nicely
as in the making of bronze, or bell metal, or
any other alloy. This fact enables the man-
ufacturers to make a variety of uniform grades
adapted to all purposes.

One grade called "Adamantine" when forged
into a tool and allowed to cool gradually is too
hard to be marked with a file and a tool can be
made with it, which when hardened can be
made made to drill through the hardest file.
Another grade called "Gun Steel" cannot be
hardened, but can be worked almost as easily
cold as wrought iron can when hot and has
great tenacity. There are other grades running
all the way between these two extremes. The
No. 3 (or "Universal grade" as it is called) is
for all kinds of machine shop tools, rock drills,
picks, etc. This grade possesses many prop-
erties distinctly and peculiarly belonging to
Chrome steel. The following is from a report
made upon this steel by the Navy Department
at Washington. "It can be worked at a white
heat, and cannot be injured by overheating;
that is, it can be welded on itself or to wrought
iron and worked in the same manner and at
the same degree of heat that wrought iron can,
and in every way the welds are as perfect and as
strong; no flux is needed in welding."

The steel used in the great St. Louis bridge
is Chrome steel, as no other could be found
which would stand the required strains. The
Chicago and Northwestern, Chicago, Rock
Island and Pacific, Burlington and Quincy and
Baltimore and Ohio Railroads use this steel
largely in their shops and their principal shops
in New York and Pennsylvania also use it. In
San Francisco it has been used in the principal
machine shops, including the Risdon Iron
Works, Union Iron Works, Fulton Foundry,
and Pacific Iron Works, and they express
themselves as well satisfied with the results.
It has also been tested at the C. P. R. R. shops
in Sacramento, where it gave equal satisfac-
tion.

It requires to be hardened and tempered at
a lower degree of heat than ordinary steel.
We saw this week a cold chisel heated to a
welding heat, then split or spread apart and
plunged into water and cooled. Then heated
to a welding heat again, hammered together
without a flux and brought to an edge in the
weld, ground and made a first-class cold chisel.
It shows the mark of having been sliced half
way up the handle. Dynamic tests of this
steel have been made at the West Point foundry
the highest strength of the 12 specimens
being 193,910 pounds; lowest strength 163,760;
average of all the specimens 179,980, or about
180,000 pounds to the square inch, which is
one-third more than Percy, in his "Metallurgy
of Iron and Steel," gives as the highest tensile
strength attained by steel.

It is said that its greatest excellence appears
when applied to rock work, such as drills,
picks, etc., and we have been shown many tes-
timonials substantiating these claims. The
agent is now about to introduce this steel into
the prominent mines on the coast.

COLD.—On the night of the 23d inst., the
thermometer at Eureka, Nevada, indicated 19
degrees below zero. The furnaces of the
Richmond Consolidated Company have all
shut down for want of charcoal. The storms
have impeded travel, so that coal-haulers have
found it impossible to deliver coal.

THE PAUL PROCESS.—The Electric mining
company, a San Francisco Incorporation, are
now building a mill at Enterprise, Butte
county, California, to work their ores by Paul's
process of dry reduction and dry amalgama-
tion.

ALMADEN.—At the Almaden quicksilver
mine prospecting is being actively pushed
ahead to discover new traces of ore. Over 22
miles of tunnelling and shafting have been run
down and through the hill on which the mine
is situated.

Artificial Rain.

The desirability of having supplies of rain
at command has of late years attracted the at-
tention of scientific men and inventors. We
say, and inventors, because the terms are by no
means interchangeable and should not be con-
founded. As an example of the former class
may be cited an aspiring genius, who, not sat-
isfied with succeeding in producing artificial
clouds by means of smokes from brush or straw
fires, was led by certain delicate meteorological
relations existing between smoke and real
clouds to attempt the production of the latter,
indirectly, through this former. Of course he
succeeded—in the newspaper item.

Ever since the application of explosives to
the art of war it has been noticed that, in
nearly every instance, a great battle is succeed-
ed by copious rain showers; this the poets call
Heaven's weeping over earth's carnage. Not
very long ago an observing person, upon whom
the fact, already demonstrated, had evidently
made an impression, applied to the War De-
partment to grant him this use of a park of
artillery for complete and satisfactory trial on
a large scale, the experiment to be made some-
where on the plains. We have not yet learned
the result of the application, but presume that
the government is content with the amount of
powder now burnt in missing Indians. Where
there is sufficient moisture in the air, the con-
cussion of heavy firing would certainly suffice
to bring it down. There it might be expected
to rain, "free gratis, for nothing." But where
there are no clouds, any amount of artillery
practice would fail to make them, and the plan
would fail in the only case in which it could
possibly be of the slightest use.

If the scheme were practicable, what an en-
joyable state of things would ensue. Imagine
a grand picnic of the farmers of a certain
county, or rain district, to decide whether or
no they wanted rain; and if so, how much.
We should have suits for damages from excit-
able tea-drinkers and nervous chickens without
end. The price of ordnance would rise so
high that no one could afford to go to war.
Glass and glaziers' materials would be in re-
quest, and the piano and flute at a ruinous dis-
count. Finally, there would be no danger of
misunderstanding the epithet "loud," as ap-
plied to American society.

But it often happens that where a supply of
water is at hand, from rivers, wells or reservoirs,
a judicious sprinkling will be much more effec-
tive than irregular soaking. In England, where
land is cultivated so carefully and minutely,
that first expense is not of so much conse-
quence, the plan of Mr. Isaac Brown is being
adopted in many localities. His process con-
sists in forcing water through small perforations
in lead pipes, by means of a powerful force
pump. The lead pipes are laid down 16 yards
apart. A 12-horse power engine works a force
pump; with a pressure of 60 or 70 lbs. per
square inch, or a head of 120 or more feet, the
engine maintains a shower upon a plot of about
an acre and a half, applying 10 tons of water
in 15 minutes. Plot after plot is watered in
rotation, the work taking place principally in
the night. There is no probability that this
system will be found of practical use in farm-
ing on a large scale; but in private grounds or
city parks having a good head of water—the
engine is unnecessary—the plan might be
found of use.

Ventilating Mines.

We witnessed this week the working of a newly
invented machine for the ventilation and cool-
ing of hot and deep mines. It is the invention
of Capt. W. Williams M. E. of this city and is
worthy of notice by the mining community.
It can be placed at any required depth in a
mine and at the same time receive its supply
of fresh air from the surface. Its principal
feature is that the air is cooled by passing
through the machine, furnishing fresh moist air
instead of dry as is the case with most ma-
chines of the kind. No grease or oil is used
about the machine, thus preserving the air in
its pure state. Without going into details of
construction, it may be stated that the machine
is simply an elongated box, inside of which a
large piston works, taking in and forcing out air
at both its up and down stroke. The bottom
of the box is filled with water, and the air on
entering circulates about the water, and is
moved down on it in such a way as to cool the
air before it passes out into the mine. The
power required to run the machine is very lit-
tle, and the mechanism is simple. The box is
of wood, as is the piston, and no lubrication is
required. The smallest machine with a six-
foot stroke will deliver 3,732,480 cubic inches
of cool condensed air into the interior of the
mine in one minute. In consequence of the
machine swimming in water, a small amount
of power will work it. The inventor is a prac-
tical mining engineer, and understands the
injury to health and strength of miners, re-
sulting from hot and impure air, as well as the
great economy of thorough ventilation in
mines. A single-acting machine of this charac-
ter has been long used in the mines in England.
Mr. Williams' improvement makes it double-
acting. The whole machine is of wood, with
the exception of the piston rod. The valves are
made of Isather and iron, and quite large. It
can be attached to the pump rod in a mine, and
worked very economically. One of these ma-
chines can be seen in operation at No. 13
Drumm street, in this city.

Fish Culture.

Within the past few years considerable attention has been paid to the culture of fish; and to the credit of California, be it said, that a number of persons are now engaged in raising trout and other fish in this State. The efforts of the California Acclimatizing Society in this direction are much to be commended, since they have not only set a good example, but have attained excellent practical results, and have been enabled to furnish eggs for hatching to individuals. There are thousands of places in California where trout could be raised with very little trouble, if a few dollars and a little labor were expended in fitting up ponds, etc. In this connection it may be remarked, that it is rather surprising that the facilities for raising fish in many places are so entirely disregarded. Many farmers who live on bacon and beans, and occasionally a little fresh meat, and from their distance from the seaboard, denied the use of fresh fish—a good and wholesome food. By the expenditure of a small amount of money and a little time, they could have an abundant supply of trout on their tables.

The writer remembers, on the occasion of an extended horseback trip, as far south as Santa Barbara from this city, stopping at a sheep ranch, on the borders of San Luis Obispo and Santa Barbara counties, where there was a fine stream of water within thirty yards of the house. He asked the people on the ranch whether there were any fish there. One man, who had lived there for two years, remembered

bottom. The ends are 5 inches high. The water is made to flow in under the upper end and out over the lower end, as the arrow indicate. By this means all the eggs are thoroughly covered by constantly changing water, and less sediment is deposited on the eggs. The end of each box near the head of the trough is made higher than the lower end to cause the water to flow in the manner indicated. The trough is 16 feet long, 8 inches deep, and 18 inches wide. The longitudinal section is made on a scale of $\frac{1}{2}$ inch to the foot.

Seth Green, the great fish culturist, used a trough somewhat similar, but he led the water in and out of each box by means of a pipe which caused a steady flow only near the mouth of the pipe. In Mr. Williamson's box the flow is equal on all parts, and the eggs have plenty of fresh water. The upper current runs up through all the eggs; and the eggs being on top the sediment does not collect on them. There being so much more surface to place eggs in the same relative space, considerable room is saved in the hatching house. The California Acclimatizing Society are beginning to use these boxes at their hatching house at Point Pedro, in San Mateo County. The device is not patented.

The University of California.

On Washington's Birthday the Regents of the University and invited guests made a visit to the State University at Berkeley and inspected the grounds and buildings. Lunch was served, and speeches were made by several

Agricultural Chemistry.

What is agricultural chemistry, and what is its practical use? These are questions naturally suggested to the minds of thoughtful men, and frequently uttered. To describe the nature of agricultural chemistry with any degree of accuracy would necessitate writing a book which should include all of its salient points, a course which would appear hardly necessary, in view of the mass of printed matter already issued upon the subject.

It is certainly true that we have had altogether too much of the vague, unsatisfactory, sensational kind of talk which is prevalent. Agricultural chemistry is made a quasi figure-head by many writers, who confound verbiage with eloquence, and ranting with progressiveness. And it is noticeable that those who are loudest in praise of what is called scientific farming, are usually those who least appreciate the meaning of the term.

While we admit the impossibility of giving a comprehensive description, it may be well to consider briefly the more prominent features of the science. Agricultural chemistry is one of the very youngest of the sciences. Theoretical or abstract chemistry is comparatively new, as it is now understood, and is making such rapid strides forward that the text books of one year must be discarded the next, if one would keep up with the steady march. Some thirty or forty years ago, only, the distinction was accepted between theoretical and technical chemistry. The latter expression was intended to cover all cases where the general science

a single instance, to show that science here is truly practical.

Not many years ago, observers engaged in the geological surveys of the different States, noticed that all along the Atlantic seaboard, from New Jersey to Florida, there existed a great belt of phosphatic deposits. These were petrified, silicified and fossil remains of vast beds of bones and shells, of animals extinct and now existing; the deposits were certainly very curious and interesting to scientific men, but of no particular use, that any one could see. The fossils were entirely distinct from marl, which is phosphatic remains partially decomposed and mellow, and which had previously been applied with good results to exhausted lands. But the raw, stony looking masses of sharks' teeth, whales' vertebrae, mollusks' shells, what were they good for, except to be put away in geological cabinets? And a small portion would fill all the museums of the world. It was owing to the recommendation of the State Geologist of New Jersey, Professor Cook, that a fair trial of the unpromising material was made. Without the suggestion the treasure might have been spurned by the feet of men for centuries.

And now for the result. The lands of older States when first settled were in a virgin condition, and yielded to the hardy immigrants wonderful returns, of which we have traditions. After centuries of constant cropping, these fields, just as rich originally as the black prairie loam of the Mississippi Valley or the wheat lands of our own California, become worn out, and could produce only a tithe of their pristine crops. The particular substance most needed and most wanting, was a soluble

IMPROVED DOUBLE RIFFLE HATCHING BOX.

having seen a fish caught in the hrush dam during a freshet in the winter, but nobody had ever tried to catch any others. These men lived entirely on sheep meat, bread and onions, with occasionally potatoes. Beef, perhaps, once a month, as they were thirty-five or forty miles from a butcher shop. Being supplied with tackle brought from the city, on the evening of his arrival, the writer went down to the creek; and, before making a cast, saw several fine salmon trout in the pond. It took but a few moments to land a fine mess—enough for the whole party—two of them weighing nearly three pounds. With this delicious food close at hand, the rancheros had lived on mutton from one year's end to the other, without taking the trouble to even see whether the creek contained any fish or not. This, perhaps, is an isolated case, but facilities equally as good, are neglected in other localities. After once starting ponds, they are of little trouble, and produce an abundant return for the time and money expended.

To those persons engaged in fish culture on a large scale, an improvement in hatching boxes, recently perfected by Mr. John Williamson, Secretary of the California Acclimatizing Society, will be of interest. We give an engraving of this box which possesses some peculiar features. Mr. Williamson calls it the Improved double riffle hatching box. Its special features can easily be seen by reference to the cuts. The upper figure shows a trough with light hatching boxes, and the lower figure is a section of the box, one-quarter of full size.

The usual way of arranging these hatching boxes, is to place the eggs on the bottom and allow the water to flow over them. A box the same size as the one represented, will then hold 20,000 eggs. Mr. Williamson puts in the box, five trays, 19 $\frac{1}{2}$ inches long and 18 inches wide with a frame $\frac{1}{4}$ of an inch thick and one inch wide, with a wire bottom, having eight squares to the inch. By this means he has space to hatch 120,000 eggs, where he only had before, in the same box, space to hatch 20,000 eggs. This is of great importance in hatching houses where room is desirable. The hatching box holding the trays, is made of $\frac{1}{2}$ inch ends, and one inch

gentlemen, after which the guests went over the buildings and grounds while the Regente and the Joint Legislative Committee held a conference with respect to the affairs of the University. The committee consists of Senators Leine, Keyes and Evans and Assemblymen Ammerman, Canfield, Turner, Friederich and Myers. They have requested full written information from the officers of the University on the following points in conformance with the resolution of the Legislature:

First—What instruction has been given in agriculture and the mechanic arts, in the University of California; whether the same has been defective or not, and if defective, wherein such defects consist, and what is the cause, as well as the remedy for such defect. Second—What has been the management by the Regents of the University of California of the 150,000 acres of agricultural lands donated by the Congress of the United States to the State of California, and by the State to the University; whether the same has been defective or not, and if defective, wherein such defect has consisted, and what is the cause, as well as the remedy, for such defect. Third—Whether or not the Regents have properly administered the funds of the University which have been entrusted to them, and if not, in what particulars. Fourth—Also upon any other matters relating to the University upon which, in the opinion of the Committee, information may be of use to the Legislature or the public.

The Committee have made an examination of the buildings and have expressed their determination to look thoroughly into the subjects referred to above. By this means the public ought to be able to know all about the University and its management, a subject in which they are just now much interested. The farming community in particular are anxious to learn what facilities are to be afforded to learn the science of agriculture and what steps are to be taken to give the students instruction in its practical departments. As stated in a former issue, this hitherto apparently neglected Department of the University should be placed on its proper footing. Its importance should give it all the special legislation necessary to secure this result.

is applied to common things. But as the field broadened and evenness opened out, a still more minute subdivision became necessary. One of the new branches was termed agricultural chemistry, and its real founder and chief exemplar was Baron Liebig. In his studies on the nature and composition of organic bodies, he became interested in the influence of soil upon growth, in a chemical sense, and was led to trace roughly, at first, their minute relations.

It was found that the constituents of vegetable compounds varied much more widely than had been supposed. The proportions of water, fibrin, gluten, alkaline salts, phosphates, etc., were discovered to be entirely different in various plants, and sometimes in the same plant when subjected to dissimilar conditions. Thus the reason why certain plants grew best on certain soils became evident on comparing the analyses of each. True, there are other influences besides chemical combination, which must be considered, such as the capability of retaining moisture and heat, or the contrary, which may be called the mechanical agencies. But, other things being equal, a given plant would require a soil made up of peculiar elements, existing within a fixed limit of quantity; and after long experience it was found practicable for a scientist, who might be really ignorant of actual farming, to pronounce judgment upon soils submitted to him for examination. If the science had stopped here, its benefits would have been large and apparent.

But the next great step was the successful attempt to reproduce good land in poor, by substituting one element for another, by adding or neutralizing, until the composition of a normal soil for the growth of any plant should be approximated. This is done by using fertilizers. These fertilizers are either direct in their action, that is, they enter immediately into the growth of the plant, or they are indirect agents, being employed to counteract or remove injurious elements. Thus many new fertilizers have been added to the list; and many artificial ones, which are now in common use, were invented. Well, the reader may ask, wouldn't we use manures without agricultural chemistry; what has it to do with the question? Much. And to prove the assertion we will cite

alkaline phosphate. And this is just what can be taken from the bone fossils.

So to-day, especially in South Carolina, the whole region within the great belt is being systematically mined for the valuable matter. Cropping out at the surface in spots, and lying beneath the surface only a few feet, in most places, the extraction is simple enough. Trenches are dug, and as soon as cleared are moved sideways, the fresh refuse being thrown into the useless hole. Movable wooden railways connect the diggings with central depots, where, by ingenious machines and processes, the raw material is sorted and prepared for market. Even along the shores of the famed Sea-land cotton strips, and in the beds of rivers, the search and extraction is constantly going on. Thus far the application of this new fertilizer to the old lands has proved highly beneficial, and without it, or some equivalent substitute, many farms would now be considered worthless.

We have given but a single example; the choice is almost unlimited.

RAIN.—The rainfall in this State thus far this season has been very large. Even in San Diego county, where the average rainfall is very small, they have already had the almost unprecedented quantity of 14 $\frac{1}{2}$ inches. Santa Barbara has had 13.11 inches this season and the total fall of last year was only 10.45. In this city the Signal Service office reports the rainfall at 18.97 inches, and Mr. Tennant reports it at 20.25. Over in Contra Costa they have had about 15 $\frac{1}{2}$ inches. San José has had about half as much as we have had in this city. Monterey and Santa Cruz counties have had about as much as San Francisco. The average rainfall of 22 seasons has been, as measured at Sacramento, 28.5 inches.

GLINES' SLATE-ROOFING, PAINT AND CEMENT.—Every person designing using this paint, or wishing further information about it, should see the advertisement in the PRESS. One hundred and twenty-five packages are now on the way to this coast; so we are informed by the patentees.

Trinity County Mines.

We collate the following items from the columns of the *Trinity Journal*:

"Red Hill."

This mining locality, just below Junction City, on the opposite side of the river, has long been known as one of the richest sections of Trinity county; and has always yielded largely for the amount of work done. For several years past, however, Red Hill has suffered with the rest of the county from a scarcity of water. We are told that the present season the mines located there are better rigged than ever before, and that water is plenty. During all of last winter, the miners on Red Hill did not get a whole day's run at any one time, whereas they are running continually the present season. With the new mining apparatus, they are also in condition to do more than double the work, under the same circumstances, and at less expense than in previous years. When we consider that the claims there have always been very profitable, we may reasonably expect that the yield this season will be enormous.

"Woodbury's Operations."

The mining investments and ditching projects of Mr. Isaac Woodbury, on Hay Fork, form the largest undertaking ever entered upon by a single individual in the mining history of Trinity county. In the near future, as soon as a sufficient statement of particulars can be obtained, we intend to furnish our readers with a full account of this enterprise. Charles Whitlock, who works for Mr. Woodbury, was in town this week. From him we learn that both Little Giants are at work there, and that two claims are being worked; one in Bridge gulch, the other in the flat below, where Jake Vodge formerly worked. A deep channel has been found in the back part of the flat, and the prospects are that the enterprise will be crowned with success. Mr. Woodbury has undertaken a great work, and certainly deserves a handsome reward.

To be a Model Claim.

Atkins & Lowden have taken possession of the Frey mine, on Grass Valley creek, under an arrangement lately entered into with the Frey Brothers. The new proprietors are now engaged in fitting this claim up with all the latest and best known machinery and rigging for hydraulic mining, including iron-pipe, under-currents, patent nozzles, etc. This claim has heretofore been known as a paying one, notwithstanding it had been worked under disadvantages and ground-sluiced in the simplest manner. There is every opportunity here for hydraulic mining as carried on in the mines of Nevada, Placer and other more advanced gravel-mining counties—plenty of chance for hydraulic pressure and ample dumping ground, with a bank that can be easily out and washed, and which prospects rich from the surface to the bed-rock. Capt. Geo. H. Atkins tells us that it is the intention of the new proprietors to make this a model hydraulic mine. He has had great experience in this class of mining, is thoroughly practical, and above all means business. The iron for the hydraulic pipe will be on the ground this week and the work of fitting up will be pushed with the utmost speed to completion. When thoroughly rigged this will, as Capt. Atkins says, be a model mine, and one which our miners, who are not yet thoroughly acquainted with the new methods, will do well to visit and examine. It will be the mining center of attraction when in running order.

New Mining Section.

Last Fall, we copied an item from the Lake county *Bee* regarding a party of prospectors who had come from that county and discovered good mines some place in the mountains near the line between Trinity and Mendocino counties. We now learn that there has been some thirty men engaged in mining on the South Fork, in this county, near where the Hettenshaw trail crosses that stream, and that they had found good prospects. Rich mining ground was known to exist in that region in early days, but the fear of Indian troubles until recently kept miners from going there. Now that the Indians are no longer troublesome and prospecting can be done without danger from that source, it is probable that that portion of Trinity will be tested, and it is likely to prove as rich as any of the older settled mining camps. The South Fork is a large stream, and can be relied on for a full supply of water the entire year. It is probable that further discoveries will be made in that section during the coming summer.

Weaver Basin.

We plead guilty to the charge of not having paid as much attention to the mines here at home, in Weaver Basin, as their extent and richness merit. Short days, in which to do a large amount of work, have not giving us time enough to go about among our miners as much as we would like to. We promise, however, to take a day or two, and that before long, in which to visit the principal claims in the Basin, and write them up, so that all who wish to know what is being done here may be furnished with the desired information. The well-known spirit of accommodation existing among our miners will undoubtedly place us in possession of a number of interesting facts regarding the claims here, and a column or two on the mines in Weaver Basin, we are certain, will not fail to interest the general reader.

An Important Investment.

Messrs. D. W. George and O. M. Loveridge

returned from San Francisco on Monday last, where they had been to make preliminary arrangements for an extensive mining investment in this county. They brought the coin with them, and the purchase of the property they desire has been concluded. On Thursday they paid to John Arn the handsome sum of \$13,260 for his Rush Creek water-right and other property—having previously paid him \$1,000; making a total for this property of \$14,260. These parties then sold the ranches, houses, etc., to Jacob Paulsen for the sum of \$4,500, they having no use for any but the mining property and water.

Arrangements have also been made by Loveridge & George for the purchase of the Dr. Ware property, everything being satisfactorily agreed, the papers made out and intended to be signed to-day, (Friday.) It is the intention of the purchasers to commence operations immediately. The West Weaver water will be taken on Oregon Gulch Mountain, without any necessary delay, and in time to do some work before the present season ends. We were informed of the concluding arrangements of this enterprise too late for an extended article this week, but will endeavor to gather additional information as to the future intentions of the projectors and give them to our readers as early a day as possible.

Nozzles.

Trotter & Smiley, at Douglass City, have been experimenting to some extent with the different sized nozzles on their Giant. They have an 18-inch pipe, with 115 feet pressure. Running through a 5-inch nozzle the reservoir is emptied in 2 hours; 6-inch nozzle, in 1 hour and 20 minutes; 7-inch, in 33 minutes; and 8-inch, in less than 20 minutes.

Sargent's Mineral Land Bills.

As there has been considerable comment on the various mining bills now pending in Congress we have endeavored to keep track of them all and publish them in full. We have given Ward's obnoxious bill in full in a former issue. The Senate, on the 6th inst., took up and passed the bill introduced by Mr. Sargent on the first day of the session, and reported from the Mining Committee, with amendments, a few weeks ago as follows:

A Bill, supplemental to the act entitled "An act to promote the development of the mining resources of the United States," approved May 10, 1872.

Be it enacted, etc., That, where applications for patents for mining claims have been filed in the proper district land office, and legal notice thereof given, without the appearance of an adverse claimant, and in which cases no further proceedings have been had for the purpose of perfecting title, each applicant shall make final proof and payment on said claims within one year from the date of the passage of this act; and, in case of like applications for patents hereafter filed, the applicants shall, in the absence of an adverse claim during the notice, make said final proof and payment within one year from the date of filing such application, in default of which the proceedings for patents so had by such applicants shall be considered void and without effect.

Section 2. That all affidavits required to be made under this act, the act to which this is supplemental, or the act to which said act is amendatory, may be verified before any officer authorized to administer oaths, and all testimony and proofs may be taken before any such officer, and, when duly certified by the officer taking the same, shall have the same force and effect as if taken before the Register and Receiver of the district land office; provided, that when such affidavits or proofs are taken at any place other than within the land district, it shall be by the clerk of any court of record in the United States.

The other bill introduced by Mr. Sargent has been materially modified, and the original bill was to get it out of the way, indefinitely postponed on Mr. Sargent's motion. The following is the full text of the

Bill as Amended.

A bill relating to placer mining lands in the State of California: Be it enacted by the Senate and House of Representatives of the United States in Congress assembled, That public lands in the State of California, other than those containing veins or lodes of quartz or other rock in place, bearing gold, silver, cinnabar, lead, tin, copper, or other valuable mineral, or lands containing coal, shall not be excluded as mineral from preemption or homestead entry unless it shall be shown that bona fide mining claim exist thereon, or that the land is necessary for outlet or other mining easements; and the price of both agricultural and placer mineral lands, outside of the limits of railroad grants, shall be one dollar and twenty-five cents per acre: Provided, That nothing herein contained shall be construed to change any presumption now existing, either by law or Department regulations, that lands within railroad-grants are mineral in character.

Sec. 2. That where two or more settlers have improvements on the same legal subdivision, whether agricultural or placer mining, or both, it shall be lawful for such settlers to make joint entry of their lands at the local land office, or for either of said settlers to enter into a contract with his co-settlers to convey to them their portion of said land after a patent is issued to him, and, after making such contract, to file an application for such land, and prove up and pay for such land, in the same manner and to the same effect as is provided by law for agricultural settlers upon the same

legal subdivision: Provided, That proof of occupation and improvement under mining rules of the portion of said land claimed as a mining claim may be made in said proceeding by the applicant as now provided by law; and notice of said application, where a patent of a mining claim is sought, shall be given and have the same effect as is now provided in cases of application for mining claims.

Sec. 3. That in cases where placer mining claims are duly located under mining laws, it shall be lawful for the parties applying for a patent for the same to make their application to purchase lands to the extent of the smallest legal subdivisions containing the said claims when such application does not conflict with the rights of other parties, and patent shall issue accordingly: Provided, That nothing herein contained shall authorize any person or company to locate more than one hundred and sixty acres as a mining claim.

Sec. 4. That all affidavits and proofs required by law to be made before the local land-officers in mining or pre-emption cases, may be taken before any officer authorized to administer oaths, and, when filed with the Register and the Receiver, shall have the same effect as if taken before those officers. Effect shall be given to this Act by regulations to be prescribed by the Commissioner of the General Land Office: Provided, That where such affidavit or proofs are taken at any place other than within the land district, it shall be by the Clerk of any Court of Record in the United States.

The special correspondent of the *Bulletin* at Washington, who always writes sensible letters, in speaking of the House Committee on Mines, says that the committee seems to think that the mining laws need some general revision (though most of its members know no more of mining than they do of astronomy) and it is hard to bring any single practical question before them to a vote upon its individual merits. Such is the gossip that floats through the closed doors of the committee room, and it undoubtedly has a large basis of truth. This opinion is generally concurred in by the miners of the Pacific coast, and there is probably more truth than poetry in it.

THE NEW ALMADEN MINE.—A correspondent of the *Alta* writing from San José gives the following as the product of the Almaden mine for 1873: January, 1,325 flasks; February, 1,232 flasks; March, 875 flasks; April, 1,000 flasks; May, 1,100 flasks; June, 910 flasks; July, 800 flasks; August, 735 flasks; September, 615 flasks; October, 700 flasks; November, 750 flasks; December, 1,000 flasks. Total, 11,042 flasks. Percentage yield, 4.87. This statement differs considerably from those previously published. In writing something on the subject several weeks since, we took occasion to call at the office of the Almaden mine to ask the yield for the year. They stated that they had given the correct figures to the *Commercial Herald* and that that paper had that week published them correctly. The yield for the year was given in the *Herald* at 12,000 flasks and the statement given above only places it at 11,042 flasks. As this in detail it appears to be more correct, though it seems strange that the people at the office of the mine in this city should make a mistake of 1,000 flasks in a total yield of only 11,000 or 12,000 flasks. The mine makes even a worse showing for the year than appeared at first. The smallest amount ever before produced in one year since 1850 was 14,000 flasks, which occurred in 1870.

MINING ACCIDENT.—About two o'clock on the afternoon of the 17th inst., at the 1,200-foot level of the Belcher mine, three men were badly injured by the explosion of a blast. It happened as follows: It is the usual practice in the mine to drill a half dozen holes at a time, in which cartridges of Giant powder are inserted without tamping; they are then exploded by means of wires from an electrical battery. The morning shift touched off a blast before they were relieved, but did not notice that one of the cartridges had not been exploded. The 11 o'clock shift, thinking that the drill hole had not been finished, started to sink it deeper, when the cartridge exploded. Frank Allen was badly hurt, cut and punctured all over the front portion of his body with small fragments of rock; Harry Lindey had his nose broken, eyes closed up and chest bruised; Jerry McCarty was cut with a piece of rock in the pit of his stomach. No one is blamed for the occurrence.

THE SOUTHERN MINES.—Private letters from the southern coast mines tell a sad state of exciting affairs. The mines in Lower California and Holcome Valley are panning out very poorly, and hundreds who expected to realize handsome fortunes have been doomed to disappointment, and are now in very destitute circumstances. Wages are very low, not averaging more than \$1 per day, and work is scarce at that. Rain is very prevalent at this season, and consequently adds to the distress. All parties desirous to emigrate for mining pursuits, are cautioned against seeking gold in Lower California, at least until better prospects are offered.—*Evening Post*.

THE KIMBALL MANUFACTURING CO., which has made such an enviable reputation in the manufacture of carriages, has taken up the business of furniture manufacture also. They will make all the furniture for Sharon's new hotel—some 800 sets—of which will be made of our native and coast woods. The company will probably employ some 300 hands this season.

Klamath County Mines.

A correspondent of the *Call*, writing from Jacksonville, Oregon, says: Owing to my anxiety to have my letter from Sawyer's Bar mailed in time, I was compelled to omit many important items which were furnished me through the kindness of W. A. Frissh, Superintendent of the Black Bear Quartz Mining Company, as well as the very interesting process of separating the gold from the sulphurets. It is a new plan which originated at Grass Valley, and is called the chlorine system. The works are in charge of Mr. James Goold. The Forks of the Salmon is another place of interest, where a Mr. Bennet is engaged in bringing water on the large bars, which are numerous in that locality, and proved to be rich; the enterprise will cost \$25,000. Another, which will cost as much, if not more, is occupying the attention of Mr. McBrown, at Orleans Bar, so that the miners on Salmon river, as well as the Klamath, look forward to lively times this Spring. The Klamath river is a considerable stream, running from Klamath lake, in the Modoc country, to the sea. It is fed by the Salmon and Scott rivers, with many others, all rich in gold. I have followed its course about 200 miles, and found mining camps wherever it is possible to work—some on the side of the mountain, others on the edge of the river, working as best they could with a wing dam, but failing to get at the bottom of the river, where all persons who are acquainted with the river believe there are immense riches. In order to properly understand the

Difficulty of Working

The mines along the river, it is necessary to bear in mind that the hills rise almost perpendicularly from the river, sometimes to the height of a mountain; and so steep as to make travel along the trail very dangerous. The leading enterprise is "The Happy Camp" claim, owned by San Francisco capitalists. Then there is the "Bunker Hill," which was organized by Samuel Ambrose, and the "Muck-a-Muck," both belonging to the Northern Hydraulic Company, composed principally of San Francisco men. Twenty-five thousand dollars have been expended on the "Bunker Hill," which is now fairly opened, and working in the channel with splendid pay. The claims are all held by patent from the United States under the new law, and are from 150 to 200 acres "in extent." Another claim, owned by Peirce Bros., San Francisco, is paying well. The hydraulic pipe used by all the claims is eleven-inch, known as the "Little Giant," and is working night and day. The most extraordinary kind of mining that I have witnessed since the days I mined myself, is on what they call the Klamath quartz claims, two of the richest being on Indian creek—one thirteen miles and the other four miles north of this place. The former is owned by James Camp & Co., and consists of forty-four acres; is immensely rich, and awaits on a late occasion, in one clean-up obtained a

Full Peck of Gold.

This is called Cassick Hill claim, and is composed of bed-rock and quartz so decomposed as to be worked by hydraulic pipe on a face 70 feet high. Shafts have been sunk in different parts of the survey with equally satisfactory results. Another claim, owned by the same company, but known as the Peterson claim, has been working several years and continues rich. There is no doubt but that the decomposed quartz is what the gold is in, and particles are carried away containing gold sufficient to build a first-class crushing mill. Many other claims in this locality are spoken of as being rich, but they are gravel and worked to advantage by the great water power used. Quartz mining seems not to be understood in this particular locality, as the most primitive means are adopted for obtaining the gold; but it is hoped that the successful investment of capital in this place will be the means of attracting some of our mining capitalists to the advantages of developing the ledge showing such rich prospects in our northern mountains. The town of Happy Camp has been named "Henly," and contains a first-class hotel, kept by M. Cudihy; also many stores.

Scott's Bar

Is situated on Scott's river, a few miles above Klamath. The town itself is undetermined and standing entirely on timber. Many of the houses look as if a "shake" would be dangerous. Nevertheless the people are happy and contented, and nearly all have families. The school boasts of sixty-five children, whose behavior and advancement would compare favorably with those in other part of the State. Quartz mining is in the same primitive state as in Happy Camp, but the rock is harder, although yet equally as rich, one proprietor having averaged for the last few years \$4,000 per year clear—out of one bunch of quartz 500 pounds weight, obtaining \$8,000—with no other way of working than ground-sluicing by a pipe, and, where quartz would show gold, to pound it out with hammers. I have myself, without trouble, picked up specimens that have been washed into the river. There are many other places whose prospects are bright, and where water is only required to develop them; and, to judge by the amount of snow at present covering the mountains, the chances are in favor of the miners obtaining all they need.

A NEW MAP of the Oomstock Lode is being made by T. D. Parkinson, of Virginia City.

Belmont.

Since our return from Belmont we have been frequently asked our opinion of Belmont and its future prospects.

We can only say that, individually, it is our firm and conscientious belief that the mines of Belmont are second to none in Eastern Nevada for richness and extent; and that the people of the district are perfectly satisfied with the outlook. We have not space for a detailed account of mining matters at Belmont; and must content ourselves with stating that all the principal mines which are being worked, viz.: those of the Belmont, El Dorado South, and Monitor Companies are all looking well, and give promise of a bright future, and that a larger amount of ore is being extracted from the two first named than ever before in their history. The last named has finished the most complete hoisting works in Eastern Nevada, and will shortly be giving a good account of itself by its production of bullion.

In addition to these mines, there are the El Dorado North, Belmont North, and Quintero; all three of which are being energetically and earnestly prospected, and which all give promise of developing good mines, being situated directly on the main lode, and being old locations, possessing almost "virgin ground."

The Quintero is in the hands of a number of prominent San Francisco capitalists; and has a paid-up working capital of \$10,000, which is a sufficient evidence that it is no catch-penny wildcat.—*Reville.*

MINERS BLINDED.—The miners who have been working the Utah mine are all nearly blind, and have been obliged to stop work on account of a poisonous gas or steam now coming in at the end of the west drift. We are not informed as to the nature of the poison, but presume it is either arsenic or copper. Two miners say that it is in the water and reaches them through the steam rising from the water. It seems to affect their heads. Their faces are swollen to such a degree as to almost close their eyes, and at the same time their vision is rendered dim. It is said the water spurts into the drifts in scores of places with the force of streams thrown from the nozzle of a hydraulic pipe. All that can now be done is to wait till this water is drained off. We are informed that the miners were poisoned in the same manner a few years ago in a tunnel in the Savage mine, and also that the same thing occurred in the Yellow Jacket. Although the miners say that the poison is in the water, it may be that it is in a gas which is forced out of the rock with the water.—*Territorial Enterprise.*

MINES ON GOAT ISLAND.—A Washington special says: "A very singular petition has been presented in the Senate by M. C. Sprague, and referred. It was signed by E. C. Curtis, Mrs. Behrs, A. Lockwood, and Hattis J. French. They pray for permission to excavate to the depth of twenty feet, more or less, on Goat Island, in San Francisco bay, belonging to the Government, for the purpose of making mineralogical and geological investigations, and—to use the language of memorialists—to remove therefrom some minerals supposed to be there deposited, of which we possess a description, to do this without molestation or outside influence, on condition that the earth therefrom removed shall all be again replaced. The island will be left as found, and no damage be really committed. Mr. Lockwood is an attorney at law in this city, but the names of the other two petitioners do not appear in the Washington Directory."

In extracting the saccharine juice from the beets, the Germans use centrifugals, cold maceration and diffusion, the latter most largely, while in France few of these improved processes are employed. Various other points may be noticed in which the Germans use better methods, the result being a larger yield of sugar of first run. The three per cent. of superiority of the German sugar manufacturers over the French is summed up as follows:—Superior quality of German beets, 1.50 per cent.; preservation of beets, 0.40 per cent.; extraction of juice, 0.25; washing the soums, 0.10; black washwaters, care on various points, 0.25; superiority of German sugar in quality, 0.50; total 3.00 per cent.

EUREKA BULLION.—During the month of January, 1,750,000 pounds of bullion were shipped from Eureka, Nevada, and 940,000 pounds remained on hand on the 1st instant. The *Sentinel* says the Richmond shipped 760,000 pounds of bullion, and have about 400,000 pounds on hand. The K. K. shipped 166,673; on hand, 200,000 pounds. Eureka Consolidated shipped 724,000 pounds; on hand, 220,000 pounds. Ruby Con. (17 days) shipped 100,000 pounds; on hand, 120,000 pounds.

SHIPPING BARLEY EAST.—Over one hundred car-loads of barley have been shipped overland for the Milwaukee, Wis., Brewery. This purchase is an experiment, but it is believed that the barley can be transported to Milwaukee at less cost than it could be obtained there of the same quality. The people of this State are hopeful that the experiment will prove successful.

The last two weeks' working at the Bald Mountain mine, Sierra county, yielded \$15,000.

CHARCOAL AND TAR AS A SURGICAL DRESSING.—The *London Lancet* strongly recommends the use of a mixture of charcoal and coal tar, containing 33 per cent. of the latter, in pulverized form, as a dressing for wounds. The powder exercises no irritative action, and is easily removed by lotions of water. The charcoal absorbs gases due to fermentation, coagulates the albumen, and prevents decomposition; in this respect materially aiding the action of the carbolic acid contained in the coal tar. For wounds which can not bear the contact of the powder, 100 parts of pulverized coal tar are macerated for some hours in 400 parts of rather weak alcohol. The solution is said to be very efficacious.

THE STICKKEN MINES.—One of our correspondents, writing from Victoria, B. C., says that there are several hundred men in that town waiting to go to the Stickeen mines. He tells us of one man he met there who had returned from the mines, and who took out \$1,500 in one day, in coarse gold. A number of men left in the latter part of January for Fort Wrangle, from which place they intended going overland in sleighs. He writes that there is anticipation of trouble with Indians near the Stickeen.

THE DUTCH HILL MINING COMPANY, Plumas county, are making arrangements to bring the waters of Deer creek to their claims, a distance of forty miles. They propose to construct it of a capacity, at the head, of 2,000 inches of water. This will insure them 1,000 inches at the claims. They already have a lot of iron pipe on the way, and will commence work as soon as spring opens.

CINNABAR.—The discovery of this valuable ore not far from Carson, says the *Tribune*, has created considerable excitement among the parties who know the facts. The specimen of float rock brought to town by the lucky discoverer assay more in quicksilver than that taken from the famous Almaden mine.

MINING SUIT.—The case of Cole & Bridge vs. H. Strout et al., is attracting considerable interest in mining circles. The matter at issue involves possession of one-third interest in the Hoosac mine, which is one of the most promising mines in the Eureka District.

DEWEY & CO., American and Foreign Patent Agents.

No. 338 Montgomery St.
SAN FRANCISCO.

Patents Obtained Promptly.

Mines and Mining—No. 1.

(By our Special Correspondent.)

In writing the series of articles I propose on mines and mining, they will be chiefly confined to Plumas and Sierra counties, through which, for three years past, I have been traveling. I shall strive to give your readers nothing but facts, as near as possible.

Early Mining.

Mining in its infancy consisted in use of the rocker or cradle, and long-tom. In those days we thought this an excellent method of obtaining the golden treasure from the rivers and numberless smaller streams and ravines that abound along the western slope of the Sierras. But this sort of mining soon became too slow; and sluicing took its place. Soon, those places which required but little capital to enable the toiling miner to reap rich returns for his labor, became exhausted, thus compelling him to seek other fields of labor to recuperate his more than probably wasted fortune.

"If the rivers and ravines were teeming with gold, there must be a fountain head," was the conclusion the reasoning miner came to. Shafts were sunk in the hills—some to enormous depths—in search of the precious metal, and resulted in the discovery of hidden treasures of golden ore, more fabulous than the storied wealth of "Aladdin's wonderful cave." To obtain this, tunnels were run at great expense, and were found to pay richly in many cases. Some were doomed to disappointment, as all could not be successful. Up to the present day, this system of mining has been carried on at a great expense to the miner, often resulting in bankruptcy for want of capital to work the mine properly. The miner has

Many Things to Contend With,

Unknown to share-holders, who, perhaps, never saw the interior of a tunnel mine, such as bad air, water, boulders of immense size, losing the lead and having to hunt for it by running what are termed "blind tunnels," and many other inconveniences, unnecessary to mention in this letter, all of which consume time and money. The reader will, no doubt, see the necessity of large deposits of gold being found in the paying gravel, next the bed-rock, in order to insure success. To the inexperienced, it seems strange that gravel, which will yield ten dollars per car load, does not remunerate the "lucky" owners with a colossal fortune at once. But, if it requires nine car loads of waste dirt to be removed in order to obtain the tenth one, containing the ten dollars, we have an average yield of one dollar per car load. Thus, it will be seen "that all is not gold that glitters." Yet

Large Fortunes are Realized

From this system of mining, but it is almost exclusively owing to the introduction of capital. It costs no more to run an engine and pump—where they are required—for 100 men employed, than it does for ten men. Of course the amount of labor is greater, and the cost to the company proportionately increased—but the amount of bullion produced is ten times greater than that of the ten men, while the wear and tear of machinery amounts to the same.

I am well aware that some will disagree with me on this point, but in the main, old tunnel miners will support my theory, that mines of this class cannot be successfully worked without the employment of a large amount of capital. I may as well remark here, that many companies engaged in mining, both in silver and gold, have been duped and outrageously swindled by the managers; and let me ask the intelligent reader why this state of affairs exists? Having been in former days connected with mining companies in San Francisco, sufficiently to enable me to give, at the present time, an impartial opinion of their inward workings—that have worked so much injury, both at home and abroad, to our mining interests—I will do so, hoping the reader will pardon my short digression.

Forming Companies.

It has been, and still is, a well known fact that men have been sent out to prospect for mineral deposits in different sections of the country by legitimate corporations, and if they were successful in making discoveries, the result was sure to be a great rush to the new mining district. Claims are located without regard to locality or quality. Specimens from claims—perhaps hundreds of miles away—are taken to the city of San Francisco; assays of great value are made from the ore.

From three to five men are bought, by giving them an interest in the mine, who call a meeting and elect themselves directors; choosing from their number a President, Secretary, and Treasurer. The bogus company is incorporated; its stock thrown upon the market, which is eagerly sought for by all classes, and a well filled treasury is supplied for the speculating thriving officials—who ride in their carriage, while the poor shareholders, who furnish the money to pay for it, are compelled to walk—that they may still swindle them, and the public to a great extent.

A Superintendent is chosen, who is in the confidence of the directors; and the honest shareholder commences to erect his "air castle." But soon the bubble bursts, the honest (God save the mark!) Superintendent telegraphs, in cypher, to the honest (?) President,

that they have struck ore in the shaft, or tunnel, that in richness has no parallel. "Buy all the stock up you can get, as it is a dead thing," and as "dead things sometimes crawl," these honest (?) managers succeed in making the stock crawl up to a high figure—after having purchased all they can obtain, for a mere song, of the stock from the deluded shareholders—the managers' stock is placed in the hands of honest (?) brokers for sale, and none but friends, (of course), are initiated into the secret (by the board of directors) that a rich strike has been made in the shaft, or tunnel, whichever it may be, and now is their time to buy. They are on the inside and know all about it. The bait takes and the managers are enriched by the late-biting gudgeons. The Superintendent receives his share of the plunder, wrung from honest toil, and the people believe that he was honestly deceived, and he returns to his post to assist his co-workers in ruining more of their unsuspecting victims, and not until the shareholders discover that they have been the victims of misplaced confidence; that the mine never had any existence of value, (only on paper), do they realize the fact that they have been basely swindled by their pretended friends, who, "would not wrong them out of a dollar for the world." It is such unprincipled men as these, who have brought discredit and distrust from the capitalist, both at home, and abroad, into the cabin of the honest toiling miner. All miners are not honest, yet the greatest thief among them, in point of honor, is the peer of such men as they.

This system of swindling was only in the past, and the stock was termed "wildcat." But at the present day very little, if any, of this style of thievery exists. Yet it has had a market effect on foreign capitalists, who ponder long and well before they invest in American mines.

I will now return to where I digressed from my subject on tunnel mining.

Quartz Mining

About this time became almost the ruling passion, and hundreds of men were beggared in the, almost universal, hopeless struggle to develop this branch of our gold producing resources. The failure to make quartz mining pay, in most instances, can be summed up in the three following reasons: First, want of experience in quartz mining. Second, want of proper machinery for crushing rock. Third, lack of means for saving the fine gold. With the aid of inventive genius, and scientific research, hundreds of these old abandoned quartz mines are being worked, at the present time, successfully, and with profit to the owners. I will here mention the celebrated Reie quartz mine, in Sierra county, now known as the Sierra Butte mine, which yielded in its early days from \$20,000 to \$40,000 per month, with the imperfect means they had at their command for working at that time. But the miners were men of experience, which, combined with system, overcame many obstacles that would otherwise have been insurmountable. The mine is now owned, I believe, exclusively by English capitalists, and is worked on scientific principles, unsurpassed by any other mine on the Pacific coast. The mode of quartz mining is well understood to be on the same principal as that of silver mining.

The system of hydraulic mining with its advantages over other systems, will form the subject for my next letter, with a general description of the different mines of Plumas and Sierra. I cannot close this letter without speaking a good word for our

Water Prospect

For the season. There never has been so propitious a water season for miners in the past fifteen years, as the present one. There is, on the northern slopes of those mountains which furnish the spring and summer supply of water, from 20 to 100 feet of solid snow, in fact, it is solid enough to be termed ice. I am informed by Charles W. Hendel, Esq., United States Deputy Mineral Surveyor, and Civil Engineer, that one cubic yard of this winter's snow, contains one-half a cubic yard of water. So incredulous as to think he had deceived himself in his estimate, I tested its truth, by filling a vessel with snow and melting it; the result was one-half as much in water. In this town, the snow, in some places, lies piled up to a depth of 30 feet, and will average on the level 10 feet. So be on the look-out for a plenty of yellow dross from Plumas and Sierra, this season. We are in the midst of one of those fearful storms, that defy the skill of our best prophets, in prophesying when it will cease.

MAXIMILIAN.

Laporte, Feb. 18, 1874.

THE Borax Miner says the Pacific Borax Works have started up again, and they are running light, but with satisfactory results.

THE Iowa Hill Canal Company have now about forty men at work along the line of their ditch, finishing up their work, making connections and putting waste-gates in some of the reservoirs.

THE Spring Valley Canal Mining Company, of Cherokee Flat, have just cleaned up from one month's running three bars, valued at \$73,000.

THE GUANALOUPE Ranch in San Luis Obispo county, will require 1,000 men to harvest its crop this year. This sounds rather steep, but we make the statement on the authority of one of our exchanges.

Miners Blinded.

In another column we republish an article from the Virginia Enterprise to the effect that the miners who have been working in the Utah mine have become nearly blind. Since that item was published, the same paper gives another saying that the blindness is of another description, and is caused by swelling of the eyelids and a closing up of the eyes. The poison does not seem to affect the vision, except in this external manner. Two of the workmen are so far recovered as to be able to go to work in a day or two. The question arises, will the eyes of these men again be closed up, or will they, by this first attack, become inured to the poison, whatever it may be? It would seem by the fierce manner in which the water everywhere spurts out of the rock, that the main drift running east and west is now near the lead, or, at least, that it is on the point of tapping a large subterranean reservoir of water.

That the water should be so strongly impregnated with minerals as to prove poisonous to the workmen is considered a good sign, as it is said that the same poisonous vapor or water was encountered in the Savage and Yellow Jacket mines some years ago previous to the striking of large bodies of rich ore.

A very heavy rush of water has occurred in the mine in the main west drift. It amounted to 30 or 40 inches. Much of the water doubtless comes from the old Utah works, in which is what is called the old Bidleman shaft, extending down to within 140 feet of the level of the drift. Since tapping the water in the drift it has been observed that there is a gradual lowering of that in the old shaft named. It will not be advisable to push the drift ahead until the pressure of water now upon the ground shall have been removed, as there would be danger of losing it by a cave; also, there would be danger of losing men.

MINES AND MINING.—We publish in this issue the first number of a series of articles from our special correspondent, "Maximilian," on "Mines and Mining" in Plumas and Sierra counties. We would recommend the attention of our readers to these letters, as they are well and ably handled, and the writer understands his subject.

THE BURLEIGH DRILL is now being used for running two tunnels in this State, one at Gold run and the other at the Cedar creek mines. Rock tunnelling by machinery is a very advantageous and cheap method of mining, as experience has proved. A card appears in our advertising columns this week from one who has had considerable experience in this class of work.

STEEL SHOES AND DIES are now being introduced on this coast by an Eastern firm, as will be seen by referring to our advertising columns. They are claimed to be superior to the ordinary shoes and dies in durability and economy. The same parties who are introducing these shoes and dies are also builders of other mining machinery.

THE Florida mine, comprising the north-half or 1,300 feet of the old "Pony Express" on the Comstock, has recently been purchased by capitalists who have started up work on it. J. J. Nagle is Superintendent.

ALL the mills of the Raymond and Ely Co., at Bullionville, are kept running night and day on ore from the mines and tailings; the mine is turning out 40 tons of ore per day.

THEY have stopped prospecting for cinnabar in Sonoma county for the present, on account of bad weather.

THE future yield of the Belcher mine promises even better than the most sanguine have expected.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch, Dated Washington, D. C., Feb. 24, 1874.

FOR WEEK ENDING Feb. 10, 1874.

BOX FOR TRANSPORTING EGGS.—Hiram A. Knight, San Bruno, Cal.

DUMPING CAR.—Carl C. P. Meyer, Yankton, Dakota.

HORSE SHOE FOR MARSHY GROUND.—Samuel Milbury and George A. King, Oakland, Cal.

PERMUTATION LOCK.—Joseph G. O'Neil, Grass Valley, Cal.

TRADE-MARKS.

MALT LIQUORS.—Merrifield and Rosener.

LINIMENT.—Frank F. Porter, Soquel, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

New Incorporations.

The following Companies have filed certificates of incorporation in the County Clerk's office, San Francisco: WEAVERVILLE DITCH AND HYDRAULIC M. Co.—Feb. 24.—Location: Trinity Co. Capital stock, \$600,000. Directors:—A. W. Gates, J. R. Carrick and C. Oregio, of San Francisco; Dr. J. M. Selbridge, of Oakland; Geo. H. Atkins and O. M. Loveridge, of Weaverlyville and G. T. Bartlett, of Gold Run, Placer county.

MARTIN & WALLING M. Co.—Feb. 25.—Location: Mariposa Co., Cal. Capital stock, \$1,000,000. Directors:—Rohr. T. Williams, J. D. Hudkins, J. S. Morgan, J. W. Tripp and A. P. Cox.

ENTERPRISE CONSOLIDATED M. Co.—Feb. 24.—Location: West Point District, Calaveras Co., Cal. Capital stock, \$3,000,000. Directors:—Frederick Morris, John R. Fischbeck, H. L. Lidstrom, H. H. Suhling, J. P. Bering, J. D. Mahsted and R. Cleary.

The following certificate of incorporation has been filed with the County Clerk of Alameda county:

OAKLAND HARBOR IMPROVEMENT Co.—Object: To dredge and open a ship channel across the bar of San Antonio creek, and protect the same; to make the creek navigable, and to connect by canal the creek with the Bay of San Leandro; to construct wharves and warehouses; to construct across the mouth of San Leandro a dam with floodgates, sufficient to turn the water through San Antonio creek, and to purchase property and acquire franchises. Capital stock, \$2,000,000. Directors:—G. W. Bowie, Wm. Graham, F. Chappell, G. M. Fisher, W. H. Gorrill, Elijah G. Z. Montgomery, E. W. Woodward, John Doherty, R. C. Gaskill, C. H. Trombley, all of Oakland.

HIGHLAND.—Some fifty miners will be put to work in the mines of the Highland Consolidated M. & M. Co., in Highland District, Nevada, this week. This resumption of work in the district affords employment to a number of men who have been for some time idle.

THE growth of freighting on the Willamette may be estimated from the fact that Lincoln, in Polk county, in 1870 stored at its warehouses 8,000 bushels, and in 1873, 123,000 bushels were stored.

THEY want a railroad in Inyo county to take bullion from the mines, many of which cannot be worked on account of lack of transportation facilities.

THE Rattlesnake quicksilver mine, at Pine Flat, is reported as having been sold last week for \$50,000.

THE Vallejo Barrel Factory has just completed an order for 20,000 sugar barrels for Honolulu.

OVER 100 car loads of ore are being daily sent to the mills on Carson river, all of which are at present running to their full capacity.

THE last two week's work at the Bald Mountain, Sierra county, yielded \$15,000.

1840. 1874.

PAIN-KILLER,

THE GREAT

FAMILY MEDICINE OF THE AGE.

TAKEN INTERNALLY, IT CURES

Dysentery, Cholera, Diarrhea, Cramp and Pain in the Stomach, Bowel Complaints, Painters' Colic, Liver Complaint, Dyspepsia, Indigestion, Sore Throat, Sudden Colic, Coughs, &c., &c.

Used Externally, it Cures

Boils, Felons, Cuts, Bruises, Burns, Scalds, Old Sores, Sprains, Toothache, Pain in the Face, Neuralgia, Rheumatism, Frosted Feet, &c., &c., &c.

PAIN-KILLER,

After a thorough trial by innumerable witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is that its sales have constantly increased and wholly upon its own merits. The effect of the

Pain-Killer

Upon the patient when taken internally, in case of Cold, Cough, Bowel Complaint, Cholera, Dysentery and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

The Pain-Killer

Derives much of its popularity from the simplicity attending its use, which gives it a peculiar value in a family. The various diseases which may be reached by it, and in their incipient stages eradicated, are among those which are peculiarly fatal if suffered to run; but the curative magic of this preparation at once disarms them of their terrors. In all respects it fulfills the conditions of a popular medicine. Be sure you call for and get the genuine Pain-Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine. Directions accompany each bottle.

Price 25 cts., 50 cts., and \$1 per Bottle.

Sold by all Medicine Dealers.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 25 cts.

A QUESTION OF TIME.—The recent cough or cold, that without proper treatment may become chronic and last for months, can be radically cured by a few doses of that valuable medicinal elixir, *Hale's Honey of Marshmallows and Tur.* Crittenton's, No. 7 6th Avenue. Sold by all Druggists. Pike's Toothache Drops cure in 1 minute.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent soliciting business, obtaining Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVISOR AND CIRCULARS FREE.

DEWEY & CO.,

New Inventions!

Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the Press. Superior Engravings Made, at reasonable rates, by artists in this office. bp-tf

Pacific Coast Agency for Patent Rights.

WM. SMALL & CO.,

331 Kearny Street, San Francisco, Cal.

We offer for sale the right to manufacture and sell in the Pacific States and Territories the following new and valuable inventions:

Dahl's Improved Plow.
Pooley's Miter Machine.
Mantzberger's Barrel Washer.
Kaestner's Wire Coal Scoop.
House's Wire Fence Stretcher.
Ramsdell's Adjustable Plasterers' Float Handle.
Wells' Improved Egg Carrier.
Baecker's Seat-Spring for Vehicles.
Campbell's Ice Cream Freezer.
Corliss' Clothes Line Reel.
Davis' Hand Corn Planter.
Riviere's Improved Plow.
Mendenhall's Spark Extinguisher and Rotary Engine.
Philo Marsh's Defecated (fabricating) Oil.
Mackie's Garden Cultivator and Lawn Mower.
Kibling's Improved Excavator Trough.

Call and examine samples and specifications. No unreasonable terms demanded.

WM. SMALL & CO.,
331 Kearny street, up stairs.

A. K. Dahl's Patent Cast Steel Plow.—We have been appointed agents for the right of the above valuable patent, to which we would respectfully call the attention of manufacturers. Strong and durable, easily repaired, light draught, well adapted to our soil.

WM. SMALL & CO., 331 Kearny St.

Pooley's Improved Index Miter Machine.—This machine is calculated to cut miters by index of any size desired. Can be gotten up at low cost. The right for this coast for sale by WM. SMALL & CO., 331 Kearny St.

House's Patent Stretcher for Wire Fences.—Invaluable for the construction and adjustment of wire fencing. Gives uniform and constant tightness, prevents breakage and pulling over of fence posts. For further particulars apply to Pacific Coast Agency for Patent Rights.

WM. SMALL & CO., 331 Kearny St.

Wood's Spiral Spring False Bottom for Water Coolers.—A sample of this important improvement for Refrigerators and Water Coolers can be seen as below. Effects a saving of thirty-five per cent. in ice and adds greatly to the durability of the cooler. Agents for right for Pacific Coast. WM. SMALL & CO., 331 Kearny St.

Muntzberger's Patent Barrel Washer.—This simple but effective machine will cleanse ten or twenty barrels at a time, by hand or other power, at a great saving of labor. The right for Pacific States and Territories on reasonable terms. For sale by WM. SMALL & CO., 331 Kearny St.

Kaestner's Wire Coal Scoop and Sifter.—The right of this handy article for housekeepers' use, for sale. A large size for furnace use can be manufactured. For right to manufacture and sell on this coast, apply to WM. SMALL & CO., 331 Kearny St.

Ramsdell's Adjustable Handle for Plasterers' Float.—Manufacturers of mechanics' implements would do well to examine this improvement, which can be made to supersede all others. For right, apply to WM. SMALL & CO., 331 Kearny St.

Tull & Weston's Improved Tnb Washing Machine.—The latest invention in this valuable article of domestic machinery. Can be used in any ordinary sized wash tub. The right for the Pacific Coast for sale by WM. SMALL & CO., 331 Kearny St.

EXCELSIOR MINING PUMP.

WITH SEVEN YEARS' USE OF THIS PUMP WE CONFIDENTLY

RECOMMEND ITS USE FOR MINING AND PROSPECTING.

The Cheapest Pump in the Market.

THERE IS NO TRADE PUMP MADE OF EQUAL STRENGTH AND POWER.

Every Pump is Tested

By Hydraulic power to 250 pounds to the square inch. So every Pump, large or small, is

WARRANTED

TO FORCE WATER 250 FEET HIGH.

Send for Circular.

VALVE.

BRITTAN, HOLBROOK & CO.,

VOLUME XXVIII
Number 10.

Working Claims by Tunnels.

A correspondent asks us some questions in relation to whether the work on a tunnel location will cover the annual expenditures required on a lode, etc., the answers of which are of interest to miners generally. He says: "Near the place I reside, is a large ledge, which crops out for some distance, and which has been located and abandoned by several different parties. I think that if a tunnel were run into the hill, so as to tap this ledge low down, good pay rock would be found. Moreover, I know of a blind ledge running parallel with, and close beside it, which I know is rich. Now, I want to work both these claims by a tunnel. Shall I make a regular tunnel location so as to catch the blind lode—and, if I do, will the work on that tunnel serve as expenditures on both claims—or must I locate the big ledge that crops, and the blind ledge separately? I do not want to do that; as I want, in some way, to work both ledges by tunnel; and make the money I spend on each cover necessary annual expenditures on both ledges. One other point is that some twelve hundred feet from where I propose to work, croppings appear, which I suppose are those of my blind ledge."

We do not see exactly how our correspondent is to get out of paying the annual expenditures on both claims, even by his tunnel location. He cannot locate both claims by a mere tunnel location. That might cover the blind ledge, but if he began to work his tunnel and did not first take up the big ledge some one else would do so, thinking he would prove its worth by his tunnel, without cost to them. Moreover he says his "blind ledge" crops out some distance from him, in which case it is not a "blind" ledge at all. Again, he knows now, as perhaps do his partners or others, that this ledge exists there or he would not be so anxious to develop it; and the law plainly says that the tunnel can only give right of possession to ledges not previously known to exist, or not appearing on the surface. If croppings of what he calls his blind lode really exist it might be traced to his location and after he began his tunnel there would be nothing to prevent other parties taking it up. The large ledge might or might not be touched after he began work but unless he regularly located it before, he could not prevent parties taking possession.

The general supposition now is that work must be done on the ledge itself to cover the expenditures. In fact, an amendment to the mining act of May 10, 1872 introduced in Congress recently by delegate Chisfee of Colorado, on this very subject, is now before the committee on mines and mining. It amends the act so as to make it declare that where a person or company shall run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to, or since the passage of said act; and such person or company shall not be required to perform work on the surface of said lode or lodes, in order to hold the same as required by said act.

After consulting with several parties well qualified to judge we do not see how our correspondent can evade the law so as to make the work done new for both claims. He must spend at least \$100 each year on each of his claims, or else render the one upon which no work is done liable to re-location.

QUICKSILVER DISCOVERIES.—The West Coast Star, published in Mendocino City, has intelligence from a Boonville correspondent of rich cinnabar discoveries having been made in Anderson valley. The assays are very satisfactory. This adds another link to the chain of quicksilver developments now taking place in the region of country extending from Sonoma round to Amador county.

PATENT INFRINGEMENT.—Joseph L. and James Hilton, by their attorney, Mr. Morgan, have commenced an action in the United States Circuit Court, against B. & B. F. Jackson, of Woodland, to recover \$10,000 damages for an infringement of an improvement on grain separators.

A Convenient Book Support.

We illustrate herewith a convenient little device for supporting the leaves of large blank books, which is the invention of Morgan Bros., of Cincinnati, Ohio. Its dimensions are, upright, six inches; arms three and one-half inches. It is made of malleable iron, polished and nickel-plated, and being neatly finished, is quite an ornament.

It has a decided advantage over the weight, as it supports the back of the book at any de-

MORGAN'S BOOK SUPPORT.

sired height, holding the page to be written upon perfectly level and firm. It is independent of the table, allowing the book to be moved freely without detaching the support. Its strength will admit of resting the weight of the arm on the hook. It is very rapidly and easily adjusted, occupying but a few seconds in removing and re-adjusting on a fresh page. It requires but one turn of the screw to fasten it, as the arms slide, and are adjustable at any desired point along the length of the upright; being held by the vertical pressure of the screw in end of upper arm. Book keepers and others, who use large, heavy books, will readily appreciate the usefulness of this invention.

California Deep Well Pump.

This pump, as its name indicates, is a California invention, patented July 15th 1873. One of the figures shown on this page represents the pump suspended in a holed well; and the other is a transverse-vertical section, showing the working portion thereof.

It is well known to farmers and others using holed wells that a single-action submerged pump, the only one heretofore adapted to holed wells, when run by horse, steam or wind power, owing to the burden of work being thrown upon one stroke, gives an uneven strain upon the machinery and causes a thumping or jerking action injurious to it, and annoying to horses when horse power is used and various means have been resorted to for remedying these evils, such as sinking double wells and using two pumps, the use of balance wheels and other expensive devices. In wells where water comes near enough to the surface to admit of using double action suction pumps, if the pump is run by wind-power and forced by high wind beyond a certain speed the cylinders fail to fill with the stroke, and the mill being relieved thereby from its work has to be "tied up" to prevent its "running away."

This invention was designed for the purpose of obviating these difficulties by furnishing a double action submerged pump, which could be operated inside of the casing of holed wells, and the inventor claims that it is the only double action pump which can thus be operated. It can of course be used in any other position in which a pump is needed, but its construction is such that the inside diameter, or bore of the pump, need be but one inch less than the diameter of the well casing; and, being submerged, it will fill with every stroke at any practical speed, thus keeping the strain equal upon the machinery; and the weight of water raised, increasing with the speed, operates as a brake to prevent wind mills from "running away."

This pump is admirably adapted for situations exposed to freezing, as by having a small hole in the conducting pipe at a point below the freezing point, to which the water will recede when the pump is at rest, it will always be ready for action. The pump is so constructed with brass and iron as to prevent corrosion by contact of iron with iron.

Brittan, Holbrook & Co., 111 and 113 California street, San Francisco, are sole agents for the manufacture and sale of these pumps, and for the sale of State and Territorial rights throughout the United States.

SAN JUAN.—Disconcerting news comes to us from the San Juan country. The Indians on the route are said to be prospecting for miners' scalps. The route is infested by hostile Indians. One party had two killed, one wounded, and lost all their clothing, provisions, stock, etc.

The greatest danger to be anticipated from the savages is in the spring. The Utes are reported

Fig. 1

Fig. 2

DEEP WELL PUMP.

to be trying to get the Navajoes to unite with them in a general raid on the whites.

Rich gold-quartz diggings are reported near Silver City, but whether it is a regular lead or only a deposit remains to be proved.

Academy of Sciences.

At the regular meeting of the California Academy of Science held on Monday evening last, the following new members were elected. A. G. Stiles, Frederick Cassell, Charles Troyer, life members; James Behrens, O. E. Gibbs, John McHenry, Jr., Walter Van Dyke, Carlton W. Miller, Edward Steele, James McKinley, William H. Sharpe and Josiah Belden, resident members.

Contributions to Museum.

The museum received a considerable addition of interesting specimens as follows: From J. W. Raymond, specimens comprising walrus teeth, fishing implements, carvings, costumes, etc., from Alaska; and spears, war clubs, hunting implements, from the South Sea Islands.

Mrs. Capt. Shelley, donated samples of Tapa or Kupa, a cloth manufactured by natives of the Samoan Islands; also specimens of the bark from which it is made.

Capt. Eldridge gave a fine specimen of the "Wandering Albatross," and also a parakeet; both stuffed and mounted.

Vicente Denis, of the Coast Survey, donated 4 specimens of shells, from the Kelp, off San Miguel Island, in Santa Barbara channel.

From W. W. Russell, specimens of "club moss" from Sandwich Islands.

From Alfred Gros, skeletons of male and female otter, with numerous shells, sponges, corals and other natural curiosities from Alaska.

From Mrs. A. Mc. F. Davis, several curiously formed bricks, which have apparently been subjected to the action of fire, each bearing strange hieroglyphics. They were dug up near Saucelito.

From Judge Ford of Monterey, through Barry and Patten, a fossil tooth of an extinct species of shark. (*Carchorodon*.) It was found imbedded in the rock at Martinez, from which it was taken with hammer and chisel. This is the same tooth which was the subject of a paper by Dr. Blake at a recent meeting.

Mr. G. F. Barker also sent through the same gentlemen a small tooth procured while digging a well at San Bruno. The tooth is supposed to be that of an extinct species of buffalo, (*Bison Latifrons*?)

A medal was also received from the Royal University of Fredericiana, celebrating the thousandth anniversary of the Norwegian Kingdom.

To the library, the Mexican Consul donated, a valuable work entitled the Natural History of Mexico.

Professor Davidson announced that he had received a letter from Alexis Agassiz, offering the Society, according to the expressed wish of his deceased father, a set of the *Flora Brasiliensis*, which work, in thirty-four volumes was now on the shelves of the society.

Papers Etc.,

A paper by W. H. Dall of the U. S. coast survey was read, entitled Notes on the Avifauna of the Aleutian Islands, especially those west of Unalaska; being a continuation of previous papers on the same subject by Dr. Dall.

R. E. O. Stearns read an interesting translation from the reports of the Society for the Preservation of the Norwegian Antiquities. It described the excavation of an ancient vessel, of the Viking period, found in the parish of Tane, Norway. It was the custom of the Vikings to convert one of their vessels into a sarcophagus on the death of a great warrior. The vessel was conveyed inland, the remains of the hero deposited in the hull, with his armor, weapons, the bones of his war charger, and the whole covered with earth. These tumuli have been discovered and excavated in various parts of Norway, and the peculiarities of ancient marine architecture exposed for inspection.

Judge Hastings read a paper on the "creeping" of railroad tracks; and one on the modern style of scientific writers, in expressing themselves in treatises.

The President made some additional observations to the paper read at the previous meeting, which are mentioned in another column.

Dr. H. C. Sill, from Montana, exhibited at the meeting skins of the Rocky Mountain goat *Aplocerus Montanus*, of a supposed newly discovered species. The hair is remarkably fine in texture, and said to equal that of the Thibet goat, employed in the costly manufacture of Cashmere.

CORRESPONDENCE.

Mining in Sierra and Plumas Counties. No. 2.

[By our Special Correspondent.]

In my previous letter, I gave but an imperfect sketch of the different methods employed by miners in extracting the precious metal from mother Earth. I said nothing of

River Mining

Yet, not intending to slight that—at one time—popular branch of California's mineral wealth. Its almost fabulous deposits of virgin gold, its prosperous mining camps, teeming with hardy and industrious miners, where want and privation were unknown, have passed away and only belong to the past. The Chinaman invaded the rivers, creeks and cañons, steadily driving the white man to the hills; and, with what result, has been fully demonstrated, in the opening up of our three great gold-producing systems, tunnel, or drift diggings, quartz—and last, but not least—

Hydraulic Mining.

In my previous letter, I had come down to this, the latest and most important system of all placer mining. To the old pioneer it seems like a dream, as he looks back along those columned years of time into the dim vista of the past, and draws in imagination a picture of mining—then and now. In the one, he sees a miner crouched beside a pool of water, panning out the products of the day's labor, beside him his rocker, pick, shovel, and buckets. In the back ground, seated by the fire in front of a canvas or hutch tent, two men are engaged in a game of "seven up," while the fourth is attending to getting supper—a rough, but happy group—happy in the thought that they possess the only means whereby the precious metal could be extracted from among the rocks and sands, beneath which it had been buried for ages. Years have passed, the picture has given way to another, more extensive and wonderful than the first. On its surface, he sees hills perforated with tunnels; mills, whose ceaseless roar of stamps crushing from the rock its hidden treasures, sounds like peals of distant thunder. Flumes of a vast size, almost large enough to convey the waters of a small river, cross each other in every direction, conveying water to the different mining sections. Great, iron pipes over three feet in diameter, through which water is conveyed from one hill top to another, by descending and ascending the mountain slopes, to which the miner attaches his "giant" pipes, through some of which 1,200 solid inches of water is forced a distance of from 200 to 300 feet, tearing down hills that are teeming with gold, and rolling immense boulders from their rocky beds, where they have lain since being called into existence by the great Creator. The pioneer turns away from the picture, wondering why it is, that the inventive genius of man has been able to construct such terrible engines of destruction as to uproot, and demolish the works of deity itself. And this is termed hydraulic mining, one asks himself, as he beholds with wonder the vast amount of labor performed by the "little giant," and "monitor" pipes. As I shall have frequent occasions to speak of the different methods of mining in these letters, I will commence with the

Mines of Plumas County.

As to their entire extent and resources, I am unable to speak at the present, as I have not visited the northern portion of the county.

The great Blue Lead is known to have its starting point several miles north of Quincy, but the exact location has never as yet been fully determined. From thence it continues along the western slope of the Sierras, or properly, over what is generally known as the foothills, to what is supposed to be its southern limit, not far south of Placerville. It seems so strange, this theory to me, that a lead running as one would suppose directly north and south, should have such a tortuous course as to embrace within its area, such world-renowned mining camps as, Howland Flat, Gibsonville, St. Louis, Grass Flat, Gardner's Point, Craig's, Eureka North, Pine Grove, Morrilstown, Poverty Hill, Whisky Diggins, Esporte, Port Wine, Sawpit Flat, Secret Diggins, Scales' Diggins, Fairplay, Brandy City, Fowler's Diggins, not forgetting Quincy and other places, including Downieville, Forest City and Alleghany, all of which are situated in Plumas and Sierra counties. By some of our best informed writers, it is claimed that the lead is divided into two distinct channels, at or near Pilot Peak, the one keeping on in almost a direct line south, while the other diverging, passes on through this place in a south-westerly direction until it strikes the great

Hydraulic Claims of Sucker Flat

And Timbuctoo. From thence taking a more southerly course it is supposed to reach the main lead south of Placerville. I wish here to correct an error that is extensively believed, both at home and abroad. It is generally supposed that all the great hydraulic mines of Sucker Flat are situated in Smartsville. This is not so. Having resided there for a period of over four months, I know that Smartville itself does not contain a mining claim as large as a gopher hole. The mining district is known as

that of Sucker Flat; Timbuctoo and Smartsville are embraced within the district. Of Timbuctoo's former greatness, and Sucker Flat's present prosperity, I shall have something to say on some future occasion. I only make these remarks, that capitalists may know that Smartsville arrogates to herself claims that belong to a neighboring town, which unfortunately sports a name not pleasing to the ear of high-toned shareholders.

The Mines around Quincy

Are undoubtedly very rich. The great detriment is want of water. Many a colossal fortune lies sleeping to-day in their mountain fastnesses for want of water. This seems to be the great drawback to placer mining in Plumas and Sierra. There are thousands of acres of rich mineral lands lying dormant in these two counties, for want of water to work them. Water could be brought from some point on the Feather river, in sufficient quantities to supply a large section of rich mineral lands, and would pay large dividends on the money invested. I would recommend the attention of capitalists to this enterprise, as they could not invest their money in anything more profitable to themselves, or the miners, who have to work for \$3 to \$4 per day four or five months in the year to pay for the privilege of living the balance of the year. I understand that the Gopher Hill hydraulic company, near Quincy, are bringing in water to their claims, which will be of immense value to them when water fails in the smaller streams. From what source they obtain water, I am not informed at present.

Nelson Creek

At one time was a rich mining camp, but at the present time is of little or no importance, except for its water privileges. Poorman's creek is struggling on, and may do well yet.

At Sawpit Flat

We find diggings of great value, which consist, principally, of the New York and Union tunnel, or drift diggings, and the Richmond Hill hydraulic claims, the Buckeye and Monitor. These two latter claims are about one quarter of a mile north-west of Sawpit Flat. The Monitor is what is termed by miners a virgin claim, and is yet hardly prospected. J. H. Thomas, Esq., has succeeded in purchasing the entire interest of the company in the Monitor, and is considered very fortunate in getting possession of so valuable a piece of mining property. The Monitor company having purchased the old Buckeye tunnel, ran an incline over 300 ft. in length to reach their pay gravel. The water was pumped out from the mine by using a turbine water wheel. The company expended \$43,000 in opening the mine, and took therefrom over \$40,000 within the space of four months, when an extensive cave occurred, caused by tapping a large vein of water, which the pump was unable to keep down.

The company were unable to reopen the mine, and the richest tunnel claim in Plumas county lay dormant, for want of capital to work it. Since Mr. Thomas has obtained possession of the Monitor, he has succeeded in consolidating it and the Buckeye. This claim being so much lower than the Monitor, has completely drained the latter of water. The object to be obtained in the consolidation, is this: The Monitor can be worked through the Buckeye tunnel, thus saving from \$25,000 to \$30,000 of outlay to reopen it, the Buckeye having everything necessary for working the consolidated mine on an A No. 1 principle. This is the claim the \$800 chunk was taken from. The water privileges of the two claims cannot be surpassed by any thing of the kind in the county, there being a full supply the year round. The consolidation of the Buckeye and Monitor was a wise and masterly stroke of policy in mining engineering, and is entirely due to that masterly spirit of development with which Mr. Thomas is deeply imbued.

The Buckeye

Is a rich and prosperous mine. The main tunnel is about 1,800 feet in length, and well timbered. There are 16 shareholders, all working men, and under the able and efficient management of J. C. Foulk, Esq., Superintendent of the company. All disagreements are avoided, everything being left to his judgment.

"The Sawpit Flat gravel mining company consolidated" is another piece of mining engineering of Mr. Thomas, and will certainly be of great benefit to the county.

The New York

Drift claim, after yielding over \$250,000, through an accidental cave of cement, was supposed to be worked out; but Mr. Thomas snatching differently bought it, and has proved, successfully, that its hidden wealth has scarcely been developed. The Union, another member of the consolidation, is also a drift claim, and is worked through the New York tunnel.

The Front Positions

Of these claims are of great value for hydraulic, which as drift claims would be valueless. The introduction of the Richmond Hill hydraulic company into the consolidation, will enable the company to work off the front position of the ground, while the rich deposits back are being rolled to the front the year round. I have been informed that the claim is owned by a company of San Francisco capitalists; if so, they can congratulate themselves on making a lucky investment.

Fowler's Diggings

Are some six miles northerly from this place, and as yet but little known. Several tunnels

were started in 1859, but abandoned for want of capital. Mr. Thomas has succeeded, after their passing through several hands, in getting control of all these claims, with the exception of Fowler's. It is generally believed that Mr. Thomas will open up a rich mining district at Fowler's. The main tunnel is in 2,300 ft., and nearly through the rim rock. This tunnel has cost some \$76,000 up to the present writing.

Fowler's tunnel is in 1,200 feet, but as the owners are quite reticent, I can say but little on the subject. La Porte, and northern Sierra mines, will form the subject for my next letter. I send you some stereoscopic views of snow scenes here. Anyone wishing to see the depth of the snow, can form a very correct opinion by looking at them through a stereoscope.

MAXIMILIAN.

La Porte, Feb. 27, 1874.

Silver City Mining Excitement.

The Virginia Enterprise of the 26th ult., says: An exceedingly rich strike was made day before yesterday by some prospectors of Silver City who have for some time been engaged in sinking a shaft a mile or so to the eastward of that town. The whole town has been thrown into a fever of excitement, and the big strike is now the talk among Silverites—every man has chunks of quartz in his fist, and gold—big, coarse, scraggy, gold in his eye. From several gentlemen of this place, who yesterday visited Silver City, we have the following particulars in regard to the location of the lead and the rich deposit so unexpectedly found: There is, at the point where the men began operations, a

Ledge Nearly Fifty Feet in Width,

Which crops out a little above the general level of the ground and which can be traced a great distance. These croppings do not wear a very promising look, the quartz closely approaching in appearance that kind commonly termed "bastard" and the surface rock containing little more than the "color" of gold. In the early days a small shaft was sunk on the line of the croppings, but the lead has long been looked upon as a "big thing" with nothing in it. The present proprietors, Harkin & Co., determined to test the leads, and relocating it, began sinking a shaft at no great distance from the old prospect hole mentioned above, and it would now seem that their faith and labors are likely to be richly rewarded. Day before yesterday, after passing through a considerable thickness of clay (resembling the pipe clay found in the gravel mines of California), at the depth of about 75 feet they came upon

A Mass of Broken Quartz Filled and Covered with Gold.

The quartz was in the form of gravel and small boulders, mingled with dirt, and presenting almost the same appearance as washed gravel. These pieces of gravel are literally filled and spangled with gold, some of it very bright, but the greater part presenting a rusty appearance. Much of this gold is quite coarse, some of the largest pieces being worth \$5, and all of it is rough and scraggy, as is all quartz gold. The dirt in which the broken quartz is imbedded is also very rich in the same quality of gold that is found in the rock, and a gentleman who was at Silver City yesterday informs us that he saw a lot of gold worth about \$20, which was panned out of some of this dirt. This rich deposit covers the whole bottom of the shaft, but, as yet, only about a wheelbarrow load of the dirt and rock has been hoisted out. Some of the boulders on exhibition at Silver City are said to look as though nearly half gold. In the middle of the shaft, where the lead seems solid,

A Hole has been Drilled

Down to a considerable depth, and the drillings brought out seem to be more than half gold. Indeed, as far as developed, all in and about the bottom of the shaft seems to be "louey" with gold. The deposit is no doubt a pocket, but how large it may be can only be surmised. It may contain no more than a thousand dollars or so, and it may contain fifty thousand dollars. The men who have struck it seem to be in no hurry to dig further at present. Coming upon so big a thing all on a sudden seems to have demoralized them and they hardly know what to do. After the exciting news was known in Silver City there was a grand rush, and men were

Out at Midnight with Lanterns,

Making locations in all directions—north, south, east and west. The mine is situated at some distance south of the Buckeye and about two hundred yards west of the Leet & Birdsell grade, a road running from this city to Dayton. The men who made the location and have been doing the work on the shaft are Mr. Harkin, a blacksmith, and some of his men about the shop. Some of those located in the claim by Mr. Harkin, thought so little of the lead that they refused to pay anything toward sinking the shaft; now, however, they are the readiest men in the world with their assessments. This strike, torn out as it may, will set a great many men to scratching the surface and "vexing" all croppings in that neighborhood.

A REAMING DRILL has been tested in several of the Leavenworth mountain mines of Colorado. The device consists of an ordinary steel bar, with a hinged tongue at one end, which cuts out at the bottom of a blast hole a spherical chamber for the powder. The drill will work excellently in all but the very hard rocks.

The Volcano Mines.

A correspondent of the Amador Ledger writes as follows from Volcano: Mr. Crandall, a gentleman representing a San Francisco company, has bonded a quartz mine situated on Grass Valley creek, belonging to the Messrs. McLaine & Sarocco, abandoned some five years ago by them, they having lost the lead. Mr. Crandall is a practical man, and commenced right by making a new survey, and having satisfied himself that the former owners had been running their tunnel away from the lode, instead of following it, commenced on a line of their own survey, diverging from the old tunnel, he struck the ledge in running eight feet and found good pay rock; he followed the lode some times when it pinched, or partially so, but Mr. Crandall is not a man to stop at trifles, he felt satisfied the lode was a true one, and such seems to be the fact; he continued on, and the ledge commenced widening, having good and well-defined hanging and foot walls, the rock increasing in richness; and now, if you should go to the tunnel, you will find a strong frame and door, with lock and chain, to keep the outside world from gazing and perhaps envying him his good luck; rumor says the rock will assay, mill process, five hundred dollars per ton; it is no doubt the richest rock ever found in this part of the county, not excepting the Telurium, a short distance to the west of this lode, which is and was very rich. Such finds give us courage, for we believe there are many more rich lodes near Volcano, and only lack a Crandall to develop them.

Our Volcano quartz and gravel company are still progressing with their tunnel. The rock continues soft; they are in two hundred and twenty feet; we are determined to push it through, believing we are bound to strike something good, either in quartz or gravel.

The placer mining, in and about Volcano, is carried on as briskly as ever; and generally with satisfactory results. The winter has been severe thus far—heavy snows, with considerable frost, have somewhat retarded mining. We are confident the fall of snow in the mountains will give us plenty of water in the summer, and probably last later in the season than last year. In consequence of the heavy rain, with snow in the mountains, the Jackson and Volcano ditches have been clogged, and several breaks and slides have occurred—one slide on the Jackson ditch, on China hill, required the removal of one thousand yards of earth—it was promptly repaired, and is now running, supplying all demands for water. As I write, Mr. Stirman came in the office, and showed me a nugget he picked up to-day, weighing five ounces; so you see the gold has not all been found yet.

OREANA SMELTING WORKS.—The old Montezuma Smelting and Refining Works, situated at Oresana, on the Humboldt river, were purchased about a year ago by General Conner, of Salt Lake. Recently the property was incorporated in San Francisco and the stock is offered for sale. A copy of the prospectus issued by the company states that the property of the Works consists of one ten-stamp quartz mill and thirty-horse power engine, two blissing stack furnaces with a fifteen-horse power engine for blowing purposes, three calcine furnaces, one cupel furnace, one reverberatory furnace, and a blacksmith shop, with tools, all enclosed in a large substantial building on the banks of the Humboldt river; also, good quarters for officers and men. The company also owns a gold mine in Sacramento District, six miles east of the works, and a water privilege sufficient to run a mill. The whole is incorporated at \$50,000, in 20,000 shares at \$2.50 each. The smelting works were erected several years ago at a cost of \$200,000, and have run successfully for a year or two on ore from the Montezuma mine in Arabia District. This was before the completion of the Central Pacific Railroad, and owing to the high price of charcoal, and materials for smelting, and a break in the mine, the business of smelting fell to the ground, and the Superintendent, an Eastern man named Nason, left the country owing everybody who trusted him for labor and material. Since then the works have been shut down, and the Montezuma has become the property of Attorney General Becker.—Silver State.

QUICKSILVER MINING.—The San José Mercury says: Among the greatest obstacles in the way of successful quicksilver mining is, first, the uncertainty and irregularity of cinnabar deposits; and, second, the immense cost attending the reduction of the ore. Unlike the well-defined gold or silver-bearing ledge, cinnabar is found only in pockets, or labores, as they are called; and, delving for these hidden deposits is a most expensive and uncertain pursuit. It is all blind groveling in the dark. Over twenty miles of tunneling and shuffling have been run down and through the Almaden hill, up to the present time, over six miles of which has been done during the last four years, under the supervision of J. B. Randol. At times the ore deposits are apparently exhausted, and the company is compelled to work over refuse rock and earth, which were formerly cast aside, as comparatively worthless; but which, now, with improved furnaces and condensers, and at the present high price of quicksilver, will pay for roasting. In the meantime, prospecting is pushed forward, and new and valuable deposits are discovered from time to time. A large portion of the hill is yet unexplored; and judging the future of the mine by the past, it is more than probable that vast treasures will yet be unearthed.

MECHANICAL PROGRESS

American vs. European Machinery.

American travelers who have seen something of their own country, and are acquainted with the condition of her trades and manufactures, agree in regard to their testimonial that even the foremost nations of Europe, which England, France, and Germany each in turn claim to be, are far behind in the possession and use of proper machinery and tools for the manufacturing purposes. So in Sheffield's first entirely shop, everything is still made by the muscular labor of the man bending over his anvil with hammer in hand, while we produce the divers objects of this trade by the dies of a drop-press worked by steam, and thus manufacture a greater quantity of a more uniform article, at a less cost, and of a quality conformed to our superior materials. No wonder that we can easily compete in many trades with Europe, notwithstanding the high price of the labor market here.

Similar features were forcibly brought out at the late Vienna exhibition, and Prof. Reuleaux, Director of the Industrial Academy of Berlin, surely an impartial witness, says in his report the following, which is highly flattering to our country and people:

"Upon the field of inventions and of inventive genius, there were but few highly remarkable achievements present; and among these, America held the first rank. Her machine exhibition bore almost exclusively the character of originality; and, although the execution was not generally superior, it contained examples of the highest order of constructive ability and perfect workmanship. France and England offered less original matter—more than both perhaps Germany and Switzerland. Upon the whole it may be said that in machine industry England has partly lost her former undisputed leadership, or that she is at least about to lose it. The healthy young transatlantic industry, which continually withdraws from us energetic and intelligent heads and robust hands, makes, with the aid of her peculiar genius, the most sweeping progress, so that we shall soon have to turn our front from England westward.

Newly devised motors, forming parts of complete machines, and models of distinct parts, exhibited as novelties or inventions, were numerous. They are distinguished from us by more direct and rapid conception. The American aims straightways for the needed construction, using the means that appear to him the simplest and most effective, whether new or old. Our historically heaped-up material, and the cautious character of the German, are so inseparably interwoven, that among the number of known means, we often forget to ask whether they are the simplest, or whether new ones might not be better. The American really constructs in accordance with the severest theoretical abstraction; observing on the one side a distinctly marked-out aim, weighing on the other the already available means or creating new ones, and then proceeding, regardless of precedents, as straight as possible for the object."—*Manufacturer and Builder.*

VESSEL FOR TRANSPORTING GRAIN IN BULK. Cross-stays are placed about half way between the deck and the bottom of the vessel, and are connected for the support of the sides. Stanchions are placed on each of the cross-stays, supported at right angles with the deck, and have partition boards upon each side, which divide the portion of the hold above the cross-stays into three compartments. The partition boards on the inside of the stanchions extend from the deck about one-third the distance to the stays. Those attached to the outer sides of the stanchions extend from the cross-stays upward a short distance above the lower edges of the inner partition boards, so that the two boards of each set of stanchions lap past each other. The compartments are connected by the spaces between the stanchions, so that the grain may pass over the outside partitions from the outside compartments, and under the inside partitions into the central compartment. This is done as the vessel rolls and is careened. The result is, the central compartment is soon filled after the vessel commences to roll, and the grain in that compartment is retained. By this improvement, shifting of cargo, it is claimed, is so prevented that no damage can occur, and the vessel is navigated as easily as it is when laden with immovable cargo.

SAFETY ATTACHMENT FOR CAR TRUCKS.—The rollers are about three times as wide as the truck wheels, and are provided with short side flanges, and turn in bracket-shaped bearings, which are pivoted in suitable manner to the cross-piece, to keep square on the track in case the truck is thrown off the track. They are hung at such height above the track that they just clear the same, the flanges keeping them on the track when thrown into use. The rollers may be connected suitably to the engine, to notify the engineer when the wheels are off the track. On the damaging or detaching of any wheel, they carry immediately the truck, taking the place of the wheels, and may prevent damage and accident.

A new packing for stuffing boxes is made of saw-dust mixed with talc, plumbago, plumbagine, black-lead, or other like substance. The saw-dust must be well sifted, and that from white wood out with the grain is preferred.

A Solid Foundation.

We learn from a recent issue of *Nature*, that there has been "for the past two years a stupendous undertaking in course of development at the Royal Arsenal, Woolwich, which bids fair to rival in point of solidity and grandeur of dimensions, the works of ancient Egypt itself. We allude to the gigantic steam hammer which is being erected in the gun-factories, for the purpose of welding more efficaciously than can possibly be done at present, the coils of which such massive pieces of ordnance as our modern Woolwich Infants consist. The first phase in this undertaking, viz., the laying of an appropriate foundation for the hammer has been accomplished. . . . The hammer itself is still in an unfinished condition, although rapidly approaching completion." The article then describes minutely the foundation constructed to support the anvil, weighing sixty tons, which is to receive the blows of the thirty-ton hammer. The ground for the foundation, being soft and spongy, piles of wood were driven to a depth of 18 feet 4 inches. The interspaces having been filled in with concrete, three cast iron plates, weighing respectively 30, 55 and 30 tons, were placed upon the heads of the piles. These castings were all run in the Foundry of the Royal Gun Factories, and consisted of about one-fourth of Calder pig-iron to four-fifths of scrap metal containing old broken-up shell and shot, etc.

Upon these lower plates were laid a thin layer of rock-elm planks, and upon these baulks of oak a foot square and thirty feet long. These in turn support two more plates of cast-iron each weighing seventy-five tons, and upon them rock-elm planks again form a smooth bed for a layer of oak stumps, two feet three inches long, placed upright and bound together by an iron band. Upon these are two more plates, each weighing sixty-five tons, which are separated by a thin layer of rock-elm plank from a huge superincumbent single casting, twenty-two feet square, and weighing nearly 100 tons. This, in fine, supports the enormous anvil block, weighing 103 tons, upon which will rest the anvil itself.

The anvil block was cast in a closed mould, which rested upon a substratum of coke and bricks, with passages left filled with straw, for the exit of the gas generated; it took nevertheless six months to cool, and could not be removed until after the manufacture and removal of several subsequent castings. About 660 tons of metal have been made use of in completing this foundation. The foundation pit in which the above structure is built is filled in to the depth of nineteen feet with concrete. The base of the structure itself is thirty feet square, the anvil will be twelve feet square, and from the top of the piles to the face of the anvil is a height of fourteen feet four and a half inches.

IMPORTANT MINING EXPERIMENT.—A series of important experiments have been arranged by Her Majesty's Inspectors of mines, for the purpose of testing the practical value of a French invention known as the aerophane, or the Denay-Rouze mining apparatus. By means of this, and encumbered with a weight of no more than eight or ten pounds, it is said that a man may penetrate at once and to a great distance into a pit filled with choke-damp, or with smoke, or with any gas of whatever nature or density, remain there for several hours, carry a lamp with him without danger, and have free use of his arms. The aerophane has already been tried in the principal mines of France, Germany, Belgium and Switzerland, and its first trial in England has been arranged to take place in the Wignen coal-field, and the well known fiery nature of the mines in that district, which has been the scene of a fearful series of terrible disasters, will afford the opportunity of a really practical test. If the invention accomplishes what is claimed for it, there is no doubt its adoption would often save a large amount of property, and frequently many lives. The mine owners, at least, will have an opportunity of satisfying themselves as to its real merits.—*Ec.*

TURBINE WIND MOTOR.—Attention is called in the German *Architectural Magazine*, to a so-called wind turbine, or horizontal wind-wheel, near Riesa, moving about a vertical axis. It has a diameter of about 17 feet, height of 10.2 feet, six curved paddles, and eight movable guide curves, and makes 10 revolutions per minute, even while running a saw, cutting a plank over three inches thick. It would probably make twenty revolutions without work, and with a good wind would furnish about six horse-power. Similar attempts, it seems, have previously been made, and careful experiments are needed to show whether they possess any advantage over the best constructed vertical wheels; especially as the comparative difficulty is the escape of the air that has operated on the paddles, and its reflex, by reason of elasticity in the wheel, may produce a sort of gyratory motion or current, sufficient to occasion a loss of power.

LIFE BUOYS.—English papers describe an invention which substantially consists in grinding or cutting cork shavings small, and roasting or burning them to a dark brown elastic char, which causes it to swell and to be more buoyant and impervious to water, and then in filling the said ground burnt cork into small bags made of oil or other waterproof fabric, and sewing these into canvas life-belts or other shaped buoys for the purpose of floating bodies in deep water, and thus saving life and property.

SCIENTIFIC PROGRESS.

Bursting of Trees and Objects Struck by Lightning.

At a recent meeting of the Manchester Literary and Philosophical Society, Mr. Baxendell suggested that the explosive effect of lightning might be due to the conversion of moisture into steam. At the meeting of that society, Nov. 4th, 1873, Professor Osborne Reynolds, A. M., stated that this suggestion seemed to him so very probable, that he had been induced to try if he could not produce a similar effect experimentally. We give the account of these experiments in his own language.

I first of all tried to burst a thin slip of wood by discharging a jar through it, taking care so to arrange the wood that the discharge should be of the nature of a spark, and not a continuous discharge. This was done by making the wood to form part of a discharging rod, with balls on the ends. This experiment was successful in the first attempt, although the results were on a small scale. It should be mentioned that the wood had been damped with water. This experiment was repeated with larger pieces of wood with various results.

It then occurred to me to try with a glass tube. This I did at first with a very small tube, passing wires from the ends of the tube until they were within half an inch of each other. The small tubes burst both with and without water.

I then used a larger tube (about one-tenth inch bore), using it in a similar manner. The discharge without water produced no effect on this, even when repeated several times, but when the tube was full of water (with the ends open) the first discharge shattered that part of the tube opposite the gap in the wire. This tube was bent in the form of a syphon, and the water stood about one inch beyond the gap in the wire on each side of it.

I then tried a stronger tube which I had been using for insulation. It had a bore of one-eighth of an inch, and was three-eighths of an inch in external diameter. It was capable of sustaining a pressure of probably 10,000, and certainly 5,000 pounds on the square inch; that is to say, a pressure of from two to five tons per square inch. It was about fourteen inches long, and bent in the form of a square-ended syphon. The gap in the wire was about half an inch, and the water extended about one and a half inches on each side of the gap. The ends of the pipe were open, and the jar charged in the same manner as before with about 100 turns of a twelve-inch plate machine. The surface of the jar is about half a square foot, and the discharge, when effected with the common rod, took place through about two inches of air.

This tube was shattered at the first discharge. That part opposite the gap and for some way beyond, is completely broken up into fragments, which present more the appearance of having been crushed by a hammer than of being the fragments of a pipe burst under pressure. Some of the fragments show that the interior of the pipe has been reduced to powder.

These fragments were scattered to some feet on all sides, but there was nothing like an explosion. I held the pipe in my hand at the time of the discharges, and the sensation was that of a dead blow. There was no noise beyond the ordinary crack of the discharge.

The manner in which this pipe was destroyed clearly showed that a larger one might have been broken. But as it was two o'clock and my fire was out, I did not continue the experiments. It is not easy to conceive the precise way in which a pressure of probably more than 1,000 atmospheres could be produced, and transmitted in a pipe of water, the ends of which were open. It might have been caused by the sudden formation of a very minute quantity of steam, or by the expansion of the water; but which ever way it was, its effect was due to its instantaneous character, otherwise there would have been an explosion. When we consider the great strength of this pipe (which might have been used for a gun without bursting), and when we see that it was not only burst, but that the interior of the glass was actually crushed by the pressure, and all this by the discharge of on a small jar, we must cease to wonder at the bursting power of a discharge from the clouds.

BIRDS AND CHOLERA.—Can birds scent the cholera infection in the air? Certain well authenticated facts render it not improbable that they can. Recent European journals state that at Munich, where several cases of cholera have occurred, the rooks and crows, which before flew about the steeples and through the trees of the public promenade, have all emigrated; and the same thing happened during the cholera seasons of 1836 and 1854. According to Sir Samuel W. Baker, the same phenomena occurred at Mauritius, where the martins, which exist in immense numbers the year round, wholly disappeared during the prevalence of the cholera.

INDICATOR OF VITATED AIR.—A solution of palladium chloride is so connected with a battery, that so long as no metal is precipitated, no current passes; but as soon as carbonic acid appears in the atmosphere, metallic palladium is precipitated, which establishes a current, and rings a bell to give warning of the presence of the noxious gas.—*Am. Ch.*

Sensitive Plants.

A curious action of the leaves of certain plants was first discovered in 1779 by Roth, in Germany, namely, that they behave as if attempting to catch insects by bending over their bodies. Darwin, with his well-known sagacity in taking hold of any fact assisting in establishing the development theory founded by him, makes use of this peculiarity as an argument in favor of the idea that passive plants which have to wait for their food, may have developed into active animals with prehensile mouths, and of which this purely vegetable action is a first attempt of nature in the direction of producing an organism which attempts to eat. After Darwin has enriched our knowledge in this line with many valuable new observations of his own, Bennett comes with new facts, and proves that many plants show this daily while growing in wet moss in our rooms in the summer. But the most important and surprising discovery is that made by Darwin and Bennett both, namely that the leaves of the common round-leaved sundew act differently when different objects are placed upon them. For instance, if a small piece of raw meat be placed upon them in place of a living fly, it will close upon it in the same manner as upon the insect, while in regard to a particle of chalk, or wood, or wool, it will remain motionless, or at least nearly indifferent.

Prof. Asa Gray, while commenting in *Silliman's Journal* upon the paper read by Mr. Bennett before the Bradford meeting of the British Association, says that with us the leaves do much more than curve around the insect or piece of meat; that as well in the *Drosera rotundifolia* as in the *Drosera longifolia* the end of the leaf folds over upon the base, and like a shut hand fairly incloses the captured insect or piece of meat.

In order to account for many unexplained habits of supposed unreasonable animals, the word "instinct" was invented, which in fact explains absolutely nothing. Now we see that this so-called instinct is shared by some plants; or have the leaves the organ of taste, so that they can distinguish between the piece of meat and wood? Is there also a consciousness in vegetable organism? or is all matter conscious?—*Manufacturer and Builder.*

Improved Manufacture of Artificial Fuel.

The *Scientific American* says: "The visitor to the coal regions of Pennsylvania, and indeed to all other localities where coal-mining operations are in active and continual progress, will not fail to remark the vast heaps of waste or slack piled in the neighborhood of the mines. It is estimated that, on an average, from forty to fifty per cent. of the entire yield, both of anthracite and bituminous coal, is, through the medium of mining, breaking, screening, and handling, reduced to this remarkable condition, causing loss to the producer and increasing the cost of the staple to the public."

Mr. E. F. Loiseau, of Mauch Chunk, Penn., has recently patented a process by which this waste or slack may be made available for fuel. "The composition of the fuel is coal-slack and common yellow clay free from sand, moistened with milk of lime. The manufacture is carried on automatically, the crude materials entering the apparatus at one end and emerging finished and ready for shipment at the other. No labor during the progress of the operation is therefore required, nor does the machine, we are informed, need any attention except to replenish its supply and remove its completed product.

At a recent trial of the fuel under one of the boilers, at the present Fair of the American Institute, we were afforded an opportunity to examine its cohesive quality. The pieces were thrown into a furnace, where very active combustion was in progress; and although allowed to remain there for a considerable period of time, they did not lose their shape or run together. As regards heating power, the inventor considers the same to be equal to the best coal. No unpleasant odor is given off; there is, of course, no slate, and we are assured that clunking does not take place. The ash, being mixed with clay, is heavy; and hence, where the fuel is used for domestic purposes, does not rise in light clouds, covering carpets, furniture, &c., with dust. The oval shape of the lumps is designed to insure a free draft through the interstices. As to cost, the inventor demonstrates that the material can be supplied at about \$1 per ton."

FIRE-BRICK atones for hot blast furnaces are attracting a good deal of attention among iron producers. The improvement is designed to increase and utilize all the heat of the blasts, and consequently to decrease the consumption of fuel necessary in operating the furnace. The greatest temperature which can be got through the usual system of metal pipes, without danger of the pipes melting, is 1,200 to 1,300 degrees, but with these new fire-brick atones, the temperature may be advanced, without risk of damage, to 2,000 degrees.

THE addition of a small quantity of borio acid to milk retards the separation of cream, and the milk does not become sour when kept several days. Beer also, to which borio acid has been added, does not so quickly become hard.—*Hirschberg.*

SHULZ's chronoscope, used in estimating the initial velocity of a cannon ball, measures an interval of time to within one fifty-thousandth of a second.—*Am. Mf.*

Weekly Variations in Stocks.

(Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.)

March 7, 1874.]

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

HOME AFFAIRS.—*Miner*, Feb. 28: In the Silver Glance mine the old rope cable of the hoisting works has been replaced by a good, strong wire cable, and the work of sinking goes steadily on. At the M. & N. W. mill men are tearing away the old furnace.

From Silver Mountain we hear very encouraging reports of a good strike in the Exchequer. The mill is making a short run on some good looking ore.

AMADOR COUNTY.

QUICKSILVER ORE TESTED.—*Dispatch*, Feb. 28: Mr. W. L. McKim, one of the owners of the quicksilver mine recently discovered in the ledge of El Dorado county, selected a piece of the ore weighing ten ounces, which he pulverized and placed in a small retort, and by this simple process saved five ounces of pure quicksilver, or 50 per cent. of the original weight of the ore. On Tuesday he took 17 pounds of the lowest grade ore, treated it in a similar manner, and it yielded about two pounds of quicksilver.

THE AMADOR CANAL.—Work on the Amador Canal is progressing finely, and will soon be completed if the weather continues pleasant.

CALAVERAS COUNTY.

SAN BARTO.—*Chronicle*, Feb. 28: The intelligence we continue to receive of the result of operations in the San Barto mine at Mosquito gulch, is of the most cheering nature. The tunnel has now been run a distance of over 60 ft. in the pay chert, and there are no indications of reaching the end of the rich body of ore. The end has widened out about three ft. Throughout the entire distance, taking the rock as it comes, unassorted, good judges estimate that the quartz will average \$50 per ton. Stopping has been commenced. A large force of men has been employed. There are about 150 tons of ore now in the dumps.

CLARK'S HYDRAULICS.—W. Y. Clark, Esq., of Railroad Flat, has two hydraulics in operation, day and night, and is preparing to start a third. In the neighborhood of a thousand inches of water will be used when three streams are employed. The hydraulics are splendidly equipped, huge iron pipes being used for conveying water to the claims, the whole being supplied with "monitors," patent nozzles, etc. The hydraulics have a pressure of nearly 300 feet.

AN IMMENSE HYDRAULIC.—We learn that a mammoth claim has been opened about 5 miles southeast of Murphy's in this county, near the Stanislaus river. Preparations for washing have been made upon a very extensive scale. Five hundred inches of water are used, having a pressure of several hundred feet. The bank of gravel is very deep, and contains gold from top to bottom.

CLEANING UP.—Washing has been temporarily suspended on the Duryea hydraulic, in Chili gulch, for the purpose of cleaning up. That process will occupy about two weeks, when we understand it to be the intention of the proprietor to tunnel the bank for the purpose of putting in blasts. Veith & Co., proprietors of the great hydraulic in Tunnel ridge, are also cleaning up.

QUARTZ DISCOVERY.—Messrs. Lewis & Fairchild have recently discovered a quartz ledge of extraordinary richness near the Mokelumne river opposite Albers' ranch, on the road to West Point. The vein is narrow, averaging about six inches in width. But little prospecting has been done upon it yet, but the rock shows immensely rich for a distance of three hundred feet in length upon the surface.

THE SPRING GULCH CLAIM.—S. S. Moser, Esq., of the Spring Gulch Claim, has recently put in a flume of immense size which greatly facilitates operations.

COOK & CO., owners of the hydraulic at the head of Spring Gulch, are washing away with energy.

RAILROAD FLAT DISTRICT.—Two weeks ago the crown-wheel of the hoisting machinery at the Sanderson broke in two pieces. The mine filled with water rapidly. The occurrence is to be deplored, not alone on account of the vexatious delay and expense, but also on account of Wm. S. Pinney, the energetic and competent agent for the Ingersoll Rock Drill, which had been employed in sinking the shaft previous to the accident. The Ingersoll Drill is another triumph of science. With the limited convenience in the Sanderson, and being driven by steam, the drill gained 65 per cent. over hand-drilling.

WEST POINT DISTRICT.—Valuable discoveries were made, recently, on the north portion of the Woodhouse, on the surface. The ore is from 12 to 18 inches thick, worth about \$100 per ton. The dumps of the Lone Star are well filled with fine ore. Several teams are hauling rock to Harris & Carlton's custom mills. Fisher Bros. struck a handsome vein near Camp Flores, some 8 inches thick, of high grade ore. A gang of men have been set at work on the Pascoe mine. An overshot wheel is being erected to supply the motive power for the hoisting works. The vein is strong and valuable, having been worked extensively but superficially in former times. Kincaid & Co. are extracting rich ore from an old mine at Camp Flores. A number of abandoned mines have been re-located lately and surveyed.

EL DORADO COUNTY.

ROSE.—*Republican*, Feb. 26: Two hundred and twenty-eight ounces of refined gold, was the result of a week's run, with 10 stamps, on ore from the Rose, which was cleaned up on Monday. The rock was taken from the shaft in sinking 30 ft.

OZON.—The ledge struck in the old Oregon mine, at a depth of over 300 ft., is exceedingly rich. At the rate at which developments are now being made, Placerville will soon be able to ship from 200 to 500 ounces per day.

NUGGETS.—We were shown several handsome nuggets of gold, a few days since, said to have been taken out of Blakely's claim, on the Blakely-Johnson "lava bed." The largest piece was valued at \$30, and the others would go from \$10 to \$15.

TREASURES FROM GEORGETOWN.—The Taylor mine still continues to prove one of the richest mines in the State.

The California Water Company is running about 10,000 inches on this divide. This is all sold at ten cents an inch, and the cry is for more.

PARSON AND SHEPHERD'S CLAIM is panning out handsomely. Their last clean up was 15 pounds of gold for 30 days run of three men.

BALD MOUNTAIN.—*Messenger*, Feb. 28: The Bald Mountain company, of Forest City, have been for some time working a full force of men. The company have cleaned up the small dump and commenced on the large one. The claim continues to pay about \$50 net per day to the share.

OAK RANCH.—The Oak Ranch company are sinking a shaft in their tunnel, which was, unfortunately, too high. They are down some 27 ft. in a body of blue gravel, but have not reached the bedrock yet. The gravel prospects well. Ten of the 27 ft. of gravel through which they have sunk, prospects splendidly, and still no bedrock. That there is an immense and rich deposit of gravel under Oak Ranch is now demonstrated.

INYO COUNTY.

FROM BENTON.—*Cor. Independent*, Feb. 21: Our mines are looking more favorable than ever, establishing the fact beyond a doubt that they are true fissure veins. The Comanche, Wilson, Eureka and the Diana are all working profitably at present, panning out largely. The Brewster and Crockett companies, of Montgomery District, have commenced work upon their claims, notwithstanding the inclemency of the weather.

KERN COUNTY.

HONDORAS MINE.—*Miner*, Feb. 28: A tunnel of several hundred feet is being run to this mine.

PLACER DIGGINGS.—Winn & Scott are Placer digging below the Mammoth mine, and are getting good pay dirt.

MENDOCINO COUNTY.

QUICKSILVER.—*Cor. West Coast Star*, Feb. 28: There is considerable excitement among the people of Anderson valley in regard to cinabar mines. They believe that without a doubt rich deposits of cinabar exist in that region, and that in a short time very rich quicksilver mines will be in operation. Several assays which have been made of croppings, give good indications.

NEVADA COUNTY.

ORIENTAL.—*Tidings*, Feb. 28: The Oriental quartz mine, situated about nine miles below Grass Valley, owned by Winn & Co., is one of those large veins which, if only an ore of average grade can be found, would pay largely. The present proprietors have worked this mine about four years with varied results; the highest average run was \$25, and the lowest \$4 per ton. They have a four-stamp mill run by water power, and with a ledge averaging five feet thick, of eight dollar rock, should be able to do a paying business.

INABO.—*Graes Valley Union*, March 1: This mine has made the usual run during the month of February. The trustees to-morrow will declare the regular monthly dividend of ten per cent. on the capital stock of the company, which will aggregate the sum of \$31,000.

Emerals did not make as good a run during February as it has done in some of the months of the past. The run, however, was a profitable one, the mill turning out something over \$10,000.

NEW YORK HILL.—Work on the tunnels and opening the mine has been actively prosecuted during the winter, the heavy rains having no effect to retard the work. The upper tunnel is producing rich ore, which improves in quality the farther in the work is carried. The mine is now self-sustaining; the profits from the ore in the upper tunnel is sufficient to pay the expense of running the lower one.

MACENTA.—The shaft is down on the incline a depth of 240 feet. A level from the shaft at the depth of 210 feet, has been run. The ledge makes a turn so that the level is toward the north in one direction, and toward the east in the other. The ledge is two feet or over in thickness, and is heavily charged with metal. About 100 tons of ore is on the dump, and will be hauled to the mill and crushed as soon as the roads will allow.

POK.—This mine is again at work sinking the shaft and taking out rock. The ore coming out of the shaft now appears to be very fine.

KENTUCKY has been doing very little work during the month. The water in the mine was too strong to be handled with advantage by the pump.

WASHINGTON BAYS.—Work is still prosecuted on the Bay mine with good results. The rock shows well in free gold and sulphurets, and

the decomposed portion of the ledge gives very rich pannings.

RANDOLPH FLAT.—The Picayune company, at Randolph Flat, have spent some months in running their tunnel further into the hill, laying a new track, flume, etc., for the better working their valuable claims. Having completed their improvements they are now taking out and washing the gravel, which shows well in gold, and gives promise of a rich yield.

PLACER COUNTY.

MINING INTELLIGENCE, ETC.—The Crater Hill mine, owned by the St. Patrick company, employ about 100 men. The yield of gold at the last cleaning was highly satisfactory, and a bright future is predicted for this mine.

THE ORLEANS MINE.—We called at the works last Saturday, and found a lively force at work, some sinking and some drifting. The main shaft is down about 60 feet, from which level they are drifting to connect with shaft No. 2, now about 40 ft. deep—100 ft. easterly—which eventually is intended to be the main working shaft.

FROM IOWA HILL.—Our mines are most all worked by hydraulic; and, at present, miners are as busy as bees. The mines here are small, there being used for hydraulic purposes only about two thousand inches of water.

PLUMAS COUNTY.

MINING NOTES.—*Cor. National*, Feb. 21: The new Black Hawks have not done much panning as yet, in their claims. The high waters have cleared the cañon of accumulated tailings, and they are going to clean up the bed rock the coming summer.

The Spanish Creek company have been running all winter, have stripped considerable bed rock, and, as I understand, are making some money. They are running one Giant all the time, and will start another one during the coming summer.

Bushman & Co., on the head of the Blackhawk, are making improvements in digging ditch, making new reservoirs, a new house, clearing away timbers, etc.

Nevada.

WASHOE DISTRICT.

OPHIA.—*Gold Hill News*, Feb. 26: The bottom of the south winze on the 1,300-ft. level is still in good ore. The ore in cross-cut No. 2, on this level, shows considerable improvement in quality. The up-raise from the 1,465-ft. level is still in rich ore. The south winze from the 1,465 ft. level has penetrated the west ore body to the depth of 25 feet, the entire distance in very rich ore, showing a steadily increasing richness, as greater depth is attained. The ore extracted from the winzes, drifts and cross-cuts on the 1,300 and 1,465 ft. levels has been stowed away temporarily in drifts and tunnels until, there being no longer room for more, the hoisting of ore was necessarily commenced last evening.

CROWN POINT.—Daily yield 450 tons of ore, from the 1,000, 1,200, and 1,300-ft. levels. The 1,400-ft. level is being opened out so as to make room for the employment of more men. The north winze, at the 1,400 ft. level, has attained a depth of 40 ft.—all the way in very rich ore. The middle winze, on the same level, is in good ore. In the main east drift, on the 1,500-ft. level, excellent ore has been encountered. The ore has remained of the same rich character for the last 10 feet made in the drift.

BELCHER.—Daily yield, 550 tons of ore, from the 1,000, 1,200, and 1,300-ft. levels. The ore stops on the 1,200 and 1,300-ft. levels are looking splendidly.

GOULD & CURRY.—The main east drift on the 1500-ft. level is in barren quartz, with a considerable flow of very hot water from the face, causing slow progress. A large air compressor, with all the necessary air pipes, and a complete set of drills, have been ordered from Pittsburgh, Pa., and are expected to arrive daily.

SILVER HILL.—A fine body of good ore has been developed between the first and second levels, lying between the north and Justice winzes. Work has been again resumed in the face of the main south drift on the first level. This drift is evidently just entering the body of ore worked on the surface, and known as the old St. Louis chimney, which was extremely rich in gold.

JULIA.—The main south drift, at the 900 ft. level is advancing at the rate of 4 ft. per day. It is now in 560 ft. south from the shaft and show some excellent prospects of good ore.

OVERMAN.—The main west drift on the 1200-ft. level is still driven vigorously ahead, the rock in the face working finely.

GLOVE CONSOLIDATED.—The main west drift, on the 1,400-ft. level is advancing favorably, the face showing very good ore.

NEVADA.—The main south drift is discontinued at present, it being through the main ore chimney, which proves to be about 60 ft. in extent, all good milling ore. The extent of this chimney is not fully ascertained as yet, but it is evidently the largest body of ore known of on American Flat.

DAYTON.—The north winze, on the third station level, is down 40 ft., the entire distance in good ore, much of the ore encountered being of the soft, decomposed, black-looking and rich character, of that found near the junction formed by the winze from the second level with the north drift on the third level.

UTAH.—The heavy drain of water from the main west drift at the first station is gradually decreasing. The bad air encountered in this drift has been driven out, and work in the face resumed. Since this drain of water from this drift commenced, the head of water in the old shaft has been lowered about 140 feet.

SIENNA NEVADA.—There is still a slight improvement in the quality of the ore extracted. Daily yield 60 tons. The ore breasts show no signs whatever of giving out. The mill is in fine condition and is kept steadily at work crushing ore from the mine. The cross drift, from the up-raise in the old Sacramento ground has passed through the small streak of ore encountered last week, and is again in clay mixed with quartz.

LEO.—The main tunnel or shaft is still being driven forward into the hill, following the ore vein, which has widened again till the foot wall has gone out of the tunnel. The ledge matter is more broken up and less concentrated than it was.

YELLOW JACKET.—Main incline 110 feet below the 1,540-ft. level, but little progress being made in sinking the last three or four days, on account of being employed in getting another pump-lift down. Water troubles less, as it is getting more drained out.

BALTIMORE CONSOLIDATED.—The large, new hoisting works building is inclosed, the roof on, and otherwise rapidly approaching completion. The new boilers are on the ground. The new pump on the 600-ft. level is in place ready for use. The pump column is nearly all in, and everything rapidly approaching a readiness to resume sinking the main shaft, and opening and prospecting the 500 and 600-ft. levels.

CONSOLIDATED VIRGINIA.—Sinking the main shaft is making rapid progress. Opening the 1,400-ft. station is also making good headway. The ore stops and breasts on both the 1,000 and 1,200-ft. levels are looking splendidly.

IMPERIAL EMPIRE.—Sinking both the north and south winzes on the 1,700-ft. level, is making good headway, the bottom of both still in quartz of a very promising character.

CALIFORNIA.—Both the north drift from the Virginia Consolidated, and the south drift from the Ophir on the 1,300-ft. level are advancing rapidly to connect with each other.

INDEPENDENT AND OMEGA.—Sinking the main shaft is progressing finely.

HALE & NONCAS.—The main north drift, on the 1,900-ft. level, has reached the north line without encountering any considerable body of pay ore.

CHOLLAS-POTOSI.—Daily yield 60 tons of ore, the assay value of which is \$30 per ton.

SOUTH SRAA.—Work is about being resumed on this mine, which is eligibly located, a short distance south of the Dayton and Kossuth mines.

CALEDONIA.—The main west drift, at the 600-ft. station, is in 212 feet, the rock in the face working a little softer, with good indications of soon reaching the main ledge.

NEW YORK CONSOLIDATED.—Sinking the main shaft is progressing at the rate of two feet per day. It is expected that the shaft will cut the top of the ledge by the time a depth of 200 ft. more shall have been attained. The drain tunnel is completed, connection having been made with the shaft, and all the water being now discharged through the tunnel.

LADY WASHINGTON.—Sinking the main shaft is being pushed vigorously ahead. The heavy body of water encountered is subsiding, the rock is much softer, and better progress is being made.

ALPHA.—The streak of ore encountered last week in the north drift, on the 1,500-ft. level from the Imperial shaft, still continues, sometimes widening out, and then again narrowing down as the work advances.

JUSTICE.—The main incline is now down 30 feet below the 400-ft. level, and progressing downward at the rate of two feet per day.

SUTRO.—The north drift is still being driven forward vigorously and is now in 120 feet. The drift is still in ledge matter, assaying on the average \$30 to the ton.

FLORADA.—The clearing out and repairing of the old tunnel is getting along finely. Good prospects have been found at various points in this tunnel.

SAVAGE.—Sinking the south winze on the 1,700-ft. level is making steady progress.

SEGREGATED ROCK ISLAND.—It is the intention of this company to commence sinking a large three-compartment working shaft in a very few days.

TYLER.—The north cross-cut from the main west drift, has penetrated the ore vein a distance of 8 feet, all the way in low grade ore.

SCORPION.—This Company are making all necessary preparations for sinking the main shaft of 800 feet before drifting for the ledges.

DANEX.—The shaft is down 342 feet, the bottom in rock of a much harder nature than that heretofore encountered and requiring continued blasting.

BUCKEYE.—Opening the new station at the 450-foot level is making rapid progress.

CHAPIN AND EAST COMSTOCK.—The new hoisting works being completed will be started up to-morrow morning.

CROWN POINT EXTENSION.—Sinking at the bottom of the shaft will shortly be resumed.

WOODVILLE.—Sinking the main incline is making rapid progress.

EUROPA.—The face of the west drift has shown an improved quality of quartz and gypsum ore the last two or three days, giving assays of \$10 to \$25 to the ton.

SOUTH COMSTOCK.—New shaft down 57 feet below the car track of the main tunnel to-day, with the bottom in very favorable looking decomposed quartz and gypsum vein matter.

KNICKERBOCKER.—The water is drained from the shaft, and preparations being rapidly made for prospecting on the lower levels of the mine.

FARMOUNT.—The main north drift is still advancing along the line of the ledge, the face in low grade ore.

The Great Bowlder Drift.

Every geological formation, whether crystal, stratum or fossil, is deeply interesting to the thoughtful observer; but possibly the most interesting of all is that wonderful deposit familiarly known as the "drift." This drift formation is a peculiar girdle of pebbles and bowlders which encircle the globe in the North Temperate zone. This remarkable gravel belt has an average width of about twelve degrees, and preserves throughout a notable uniformity in its deposition and general characteristics. In geological phrase the drift is variously denominated the "glacial period," "post tertiary period," and "quaternary period." By whatever name it may be designated, it is quite apparent that the drift immediately preceded the present condition of affairs upon this planet, and that its deposition was comparatively recent. Indeed, there are substantial reasons for believing that this latest of terrestrial cataclysms occurred long ages after man had existed upon the earth. Many theories have been advanced in relation to the origin of the drift, some maintaining that the gravel and bowlders were carried from the North by floating icebergs; others that they were borne along by moving glaciers, and others that they were distributed by a mighty tidal wave of the ocean. We have neither the space or the inclination to discuss these theories here. Suffice it to say that the gravel beds vary in depth from a few feet on their extreme southern rim to many fathoms in the far North. The pebbles and bowlders are nearly all rounded and polished by the action of water and by mutual attrition. That this tremendous mass of loose rocks came from the North has been proven by actual investigation, for they have been traced to the parent ledges from which they were torn in Asia, Europe and America. Another proof of their northern origin rests in the fact that wherever the drift beds are observed, the gravel invariably increases in size as they are traced toward the Arctic regions.

That the deposition of this immense mass of stony fragments was sudden and violent is apparent from the fact that the beds not only bear a general uniformity of structure and present no features of gradual formation, but they also give proof that the mighty force which hurled them towards the equator, also caused them to annihilate and entomb all the fauna and flora which then existed in the North Temperate Zone. That man existed on almost every portion of the globe prior to the great drift catastrophe is now generally conceded by archaeologists and geologists. Rude works of art, such as stone hatchets, obsidian and flint arrow heads, stone mortars and pestles, and many other works of primitive men, have from time to time been picked up from the "hed rock" or strata immediately underlying the drift in every portion of Northern Europe, Asia and in North America. That the manufacturers of these stone implements existed upon the spot where the articles are now found is evinced by the fact that each locality affords its own distinctive character of implements. There seems, however, to have been a surprising similarity in the habits and mode of living of the *genus homo* in the stone age, the world over. They were all flesh-eaters, and subsisted like savages now subsist, by the chase, and the small deer which they hunted were the mastodon, the giant elk, the great bear and other antediluvian monsters.

In California and Nevada the vestiges of post-pliocene man are numerous and anomalous. Since the discovery of gold in California the placer miners have been constantly exhuming vases, mortars, pestles, arrow and lance-heads, stone axes and the like, all mingled with the petrified remains of the primeval forests and the silicified bones of extinct animals. The most singular fact in relation to these relics, is that they are invariably found directly on the bed rock, under the gravel-beds, in many instances hundreds of feet from the surface, and usually in the richest "pay-dirt" of the placer, thus showing clearly that both the gold and the gravel have been deposited where they now lie long since the owners of the stone implements existed upon the earth.

Speculation upon these important facts would lead us beyond the limits of a newspaper article, and we shall merely allude to one other notable feature of the California drift. What is known as the "great blue lead," or deep, gold placer which skirts the western slope of the Sierra Nevada, and which is plainly traceable for several hundreds of miles through the country, is famous for containing gold-bearing quartz-pebbles and bowlders which, in crystallization and lithological structure, are totally different from any variety of gold quartz to be found in any explored locality on the Pacific coast. These bowlders are frequently very rich in crystallized gold: they are all worn and polished like the surrounding gravel and have evidently been carried to their present resting place by the great drift. As we have stated, these quartz bowlders are different from any of our quartz deposits both in hardness, color and texture. Now, if it be true that the great bowlder drift came from a remote region in the British possessions, which geologists assure us is true, is it not reasonable to suppose that these surprisingly rich quartz-pebbles indicate the existence, in the far North, of the heaviest gold deposit in the world?—*Virginia Chronicle*.

THE "Peerless" quicksilver mine, Sonoma county, has been sold to Eastern speculators.

Arizona Mines.

A correspondent of the *Chronicle* writes from Tucson, Arizona as follows: Since peace has been established in Arizona all kinds of business is beginning to revive. In traveling from one end of the Territory to the other no danger is or need be apprehended, provided the attempt to force the Hualapais from their homes is not persisted in. Through the wisdom and energy of General Crook the Indians have been taught, by force, the only argument they can ever understand, that they must be quiet or die. This is the first time, for many long years, that prospecting or mining could be engaged in with safety, and this short space has been more than sufficient to exemplify the truly wonderful wealth of our mountains. From all directions we receive samples of fine silver and gold ores and advices informing us that the much-needed work of sinking shafts to develop the nature and extent of the veins is begun in earnest and can have but one conclusion, that of making us the richest mining section of America. In some sections arastras have been constructed and worked with encouraging results. Aside from the precious metals, there are copper mines capable of producing sufficient for the world's consumption annually. Ores ranging in value from 30 to 60 per cent. copper exist in several mines, and no doubt others will be discovered equally as rich. The day of progress is just beginning to dawn on us and our remote land is to take a high place among the mineral producing regions of the Pacific. "The stone that was rejected by the builders afterwards became the chief corner-stone of the temple," and those who have believed that Arizona would never be anything but a wilderness, too lonely to howl, will see it, even long before the great railroad comes to help us, a rich and prosperous Territory.

The river bottom lands are very fertile and yield good crops wherever farming has been tried. The mountains, hills and valleys afford excellent grazing for any number of herds, and it is now becoming a favorite business. By the time the Texas Pacific is completed, we will be ready to ship immense quantities of gold, silver copper, horses, cattle, sheep and other products required in the business industries of the world.

The copper mines on the Frisco river are shipping to Baltimore by way of Granada, the terminus of the Atlantic and Pacific Railroad. The copper mines near Tucson are now sacking, to ship by the same route. The freight rates to San Francisco are much higher than by the Atlantic and Pacific road. So it will soon be with the passenger trade, for it costs but little more money to go to New York by this route than it does to go from Arizona to San Francisco. Several of our merchants find it to their advantage peculiarly to patronize Eastern markets. Naturally our trade should be with San Francisco; but we are not wealthy enough to pay the exorbitant freights charged—not by the ton, but by the foot. A pair of hells is squared, and though not weighing over 125 or 150 pounds, is by measurement made to weigh about 500 or 600 pounds, and so on through the whole list. The Pacific Mail Steamship Company is a great power, and through its workings much of the trade that would go to San Francisco goes away from you.

ARTESIAN SHAFT.—As soon as the weather will permit, General Williams and company will resume work on their prospecting shaft, situated in the eastern suburbs of the city. They now have a good supply of diamonds for their drills, and fear no more delays after again resuming operations. But one more hole remains to be drilled before they will begin the work of blasting out their shafts to the full size—a first-class three-compartment shaft. The holes marking out the size of the shaft are all completed to the depth of 500 feet, except one, as we have said. The work of blasting out the rock will progress very rapidly, as there is nothing to be done but to put in Giant powder cartridges and blow out the core as fast as it can be hoisted. The "prospector" brought up by the drills will justify the sinking of a first-class shaft. As soon as another hole has been completed, parties in Carson City will take the drill and machinery to that town for use in drilling artesian wells. There can be little doubt, from the lay of the land, that such wells will succeed admirably in that town. In a valley encompassed by high mountains water should rise to the surface in wells of a depth of two or three hundred feet.—*Virginia Enterprise*.

INDIUM.—Indium, like thallium, was first revealed by its spectrum, which consists of two bright indigo bands, the more brilliant of the two being a little more refrangible than that of strontium, the other a trifle less than that of potassium. It is found in one or two varieties of wolfram, and in zinc and its ore in exceedingly small quantities—the zinc of Freiberg, Germany, in which it was first observed, containing not more than one part in two thousand. When zinc is dissolved in sulphuric acid, the new metal remains in the spongy residuum. To obtain it, dissolve this residuum in nitric acid, and treat it with ammonia and carbonate of barytes, when the hydrate of indium is precipitated. This indium sponge may then be melted with cyanide of potassium, resulting in a whitish metal, which, after a while, assumes the tint of bismuth, and gradually loses its color so as to resemble lead. It has a density of 7.4 melts at 176 centigrade, burns at a red heat, and drives out hydrogen on solution in sulphuric acid.

French Guiana.

We have permitted, says the *Salt Lake Tribune* of February 20, to make the following extracts from a private letter written by Thos. E. Jones to a friend in this city. Mr. Jones is well known here, and his statements can be relied on as being strictly true:

I am now in the mountains—or forests of Cayenne, prospecting for gold. I have seen some very fine specimens of the article, and am satisfied there are spots that are probably rich. The rental of land is cheap, and wherever there is a mining company, mining successfully, the land for miles around is bought up and prospected. I think the chances are thin, but I shall, however, look a little longer and satisfy myself.

The Formation of the Country.

As far as I have seen, is a bluish clay, which resembles, when put in water, washed putty. The beds of the creeks are of the same material, and contain considerable quartz, some of which shows free gold. There is nothing here that indicates a wash. I have not seen a gravel stone in the country. The gold is in a rough state. I have examined the hills, but there is nothing to guide a person, and everything is covered with the blue clay I before mentioned.

The Climate.

It has rained every day since I came here, and the rainy season, I am informed, begins next month and continues until June. It is very hot, and a white man cannot work.

To-morrow I go with an African about ten miles to a creek, which he says is good. If I can write anything encouraging, I will, but there is one thing certain, I will not write that this is the richest country I ever saw, when I know it is not. It is by no means a fit country for a man without means. A person should have at least \$1,000 but I landed at Surinam with only \$10. That was in September, but I got through and up into the country.

Don't Come.

Mrs. Murphy wrote for one or two parties to come out. On what grounds she did it, I am unable to say, as she had only been in the country one month, and her husband had not been in the mines. She knew nothing to justify her in doing so. Until I see something very different from that I have already seen, I will not write for anybody to come.

Oregon Gulch Mountain.

The subjoined mining intelligence is furnished by the *Weaverville Journal* of the 21st ultimo:

The mountain, or dividing ridge, between Weaver Basin and Oregon Gulch has long been generally believed, and almost positively known, to be one of the very richest gravel deposits in California. No water is the only reason why it has not been extensively worked—that is, no water high enough, for the richest deposit is high up on the mountain. No work has been done on this divide, except what James Ward has done with a very limited supply of water—usually holding out no longer than while the rain was falling—and this work is considered only enough to prospect the deposit. With the small amount of water at his command, Mr. Ward has not been able to average more than two weeks' sluicing per year for several years; and during these two weeks he has not stripped as much bed rock as could have been done in a single day with a good head of water in a properly rigged claim. Yet he has made a living, and this is sufficient to show that the gravel deposit he has opened is immensely rich, and is known to be extensive. The Ward claim, together with considerable adjacent mining land, has now passed into the possession of Loveridge, George & Co., and it is to cover this deposit that this company proposes to carry the West Weaver water, lately purchased from Dr. Ware. The water will be taken from West Weaver creek about a mile above the present dam, and 3½ miles of ditch will put it on the Oregon Gulch divide, over 470 feet higher than where the Junction City wagon road crosses. This ditch will cover a more extensive and richer section of mining land than is covered by any water ditch in the county at the present time, and its completion will distinctly mark a new and brighter era for Trinity county. No time is to be lost in building this ditch, as it is intended that water shall be turned into it by the 1st of May, and perhaps sooner. The line of ditch is already surveyed and work is to commence at once. As to what immediate use is to be made of the Rush creek water, the company has not yet decided, but the waters of West Weaver, Rush creek and Stuart Fork are intended to supply a chain of ditches which, when completed, will surpass any similar work ever constructed in the State, and will add greatly to the future prosperity of our country.

The bridge to be constructed over the Frith of Forth will be by far the largest in the world. According to the *London Builder* its height will be 150 feet, and the number of spans nearly 100. The smaller span will be 150 feet wide, which is beyond the average width of the largest spans in ordinary bridges; but the crowning marvel in the whole structure is the great span in the center, which is to be 1,500 feet, or nearly one-third of a mile, in width—an extent unparalleled in any existing structure of the kind. The entire cost of the bridge will be at least ten millions of dollars.

Treating Chrome Steel.

In our last issue we presented some of the advantages of the use of chrome steel, and now give from the circular of the company the proper methods of treatment.

Forging.

For forging, it may be heated to almost a white heat without fear of injury; in fact, it is desirable that it be worked at a high heat. The Nos. 2 and 3 grades are preferable for welding purposes, as they may be welded to themselves or to iron, without fear of injuring the quality.

Tempering.

For tempering, the steel should be dipped at a low red heat, as seen in the shade; all tools forged from a large body to a small edge should be allowed to cool off after forging, and be re-heated for tempering. The reason for this is, that the interior of the tool retains the heat at which it was forged sometime after the exterior surface has cooled, and is still too hot for tempering, and if then put into the water or other cooling preparation, is liable to crack.

A simple method of arriving at the proper heat for hardening chrome steel is to place the end of a bar into the fire and heat it; take it out, and note the different degrees of heat the whole length of the heated portion; then plunge it into cold water. After cooling, break off a little at a time with a hammer across the anvil; the "grain" (if the point of the bar has been too hot) will show at first coarse and granular and gradually become finer, until you reach the point where the bar was heated to a dull red; and there the "grain" will be found fine and fibrous; and the steel harder, stronger and tougher than where the heat was greater.

The point where the fine fibrous "grain" appears, was at the proper heat when dipped, and that is the heat required for successfully hardening tools from chrome steel.

Annealing.

For annealing, heat the steel uniformly in all its parts to a low red heat, and cover well up in any of the usual annealing substances.

Welding.

For welding, heat the steel as you would iron, lay the pieces together, and "tap" quickly and lightly until they adhere, then gradually increase the force of the blows until the weld is complete.

When possible it is well to "upset" a little by "tapping" lightly on the ends with the hammer.

The reason the steel should be "tapped" lightly at first, is that being very hot and therefore very soft, (almost molten) if struck too hard it is liable to fly.

Harden at the lowest heat at which you can get the steel to take the temper.

The only way tools from this steel can be spoiled, is by dipping them in water or hardening mixtures when too hot. The steel may be restored by re-tempering at the proper heat.

It being absolutely essential to the successful use of chrome cast steel that it should be hardened at the lowest heat at which it will take temper, (a low cherry red in the shade), and all purchasers of tool steel should conform literally to this requirement; otherwise, the peculiar and distinctive properties will not be developed.

TUNNELS.—The completion of the Hoosac tunnel and the rapid progress of the Sutro have caused the miners both in the East and in the West to look with interest upon what has been and is protected in connection with tunnel driving. It is in Germany, says the *Mining Journal*, that the great tunnels have been constructed, and these have been made exclusively for mining. There is the great tunnel at Freiberg, twenty-four miles long; the Ernst-August and the Georg at Clausthal, thirteen and a half and ten and three-quarter miles respectively; the Joseph II. at Schemnitz, nine and a quarter miles; the Rothschildenberg at Freiberg, eight miles; the Mont Ceniz, seven and a half miles, which about completes the European list. In the United States we have the Hoosac, in Massachusetts, five miles long, the Sutro, in Nevada, for opening up the celebrated Comstock lode; this tunnel, although only four miles long, will, with its ramifications to the various mines of the district, prove one of the most important in America; the Sierra Madre tunnel at Black Hawk, commenced during the present year, and which will be twelve miles long, as well as San Carlos and Union Pacific tunnels, which are under two and a half miles. The Ernst-August tunnel was driven at the rate of a mile per annum, and it will be interesting to notice how long it will take the Americans, with all the approved appliances at present to command, to complete the nearly similar Sierra Madre Tunnel.

IMPROVED BUTTON HOLDER.—The holder consists of two plates of metal which are forked at one end, the space between the prongs being V-shaped. One of these plates has grooves on the inner edges of the prongs, which grooves receive the buttons. This V-shape of the opening adapts the holder for buttons of different diameters. The cloth passes in between the two plates, and is pressed upon the buttons by the prongs of back plate as the two plates are pressed together or toward each other, when the holder is in use, by the fingers of the operator. The button is then sewn on with a needle and thread, in the usual manner. The advantages claimed are that the fingers are not exposed to the needle, and the sewing on is performed with much greater ease.

USEFUL INFORMATION.

Marbled Paper.

This, much used by bookbinders, is produced in a very curious way. The name is not exactly suitable, seeing that few of the specimens are imitations of real marble; but it has gradually become applied to sheets of paper of which one surface is made to imitate any kind of stone or wood. Small brown spots on a light ground, marble veining on a shaded ground, curled patterns and wavy patterns, all are produced in great diversity. The colors are of the usual kind, such as Naples yellow, yellow lake, orpiment, verigris, rose, pink, red lead, carmine, terra di sienna, Dutch pick, indigo, Prussian blue, verditer, amber, ivory black, etc.; they are ground up very fine with prepared wax and water and a few drops of alcohol. A solution of gum is made of gum tragacanth, alum, gall, and water, and placed in a trough or shallow flat vessel. Color is thrown on the surface of this gum water, usually by striking a brush against a stick, so as to produce a shower of sprinkles. Pigments of different tints and different thicknesses or degrees of consistency are thrown on; some spread more than others, and thus a diversity of patterns is produced. Sometimes the color is thrown on by means of a pencil of very long bristles; it is diversified by means of a rod, held upright and carried along amongst the colors in a wavy or spiral course; and it is further cut up into tortuous lines by passing a kind of comb along it. All this takes place on the surface of the gum solution in the vat. When the vat is prepared, a sheet of paper is laid down flat on the solution, care being taken that every part of the surface shall be wetted; the paper takes up a layer of paint, fancifully disposed in a pattern or device, and is hung up to dry. In order that one color may not be blended or confused with another, they are ground up with different liquids, some watery, some gummy, some oily. The imitations of marble, gray and red granite, and fancy woods, are certainly not very faithful; but the paper is lively in appearance, and remains clean and bright a long time when polished. This polishing is effected by moistening the colored surface of the paper with a little soap, and rubbing it with a piece of smooth marble, an ivory knob, a glass ball, or an agate burnisher. Beautiful products have been produced within the last few years under the name of iridescent and opalescent paper. Like the commoner kinds, these receive colored devices on one surface; but great delicacy and care are called for in the processes to produce the exquisite play of light and shade which suggests the names given to these varieties.—*Practical Magazine.*

TESTS FOR ALKALOIDS.—Phosphomolybdic acid has long been used as a test for alkaloids. Phosphotungstic acid has also been recommended for the same purpose, and recently Scheibler has called attention to two new acids prepared by him, the formulae of which seem somewhat doubtful, but which are excellent tests for alkaloids. The writer has made a few experiments with a solution prepared very easily, by boiling, for a few minutes, common tungstate of soda with half its weight of syrupy phosphoric acid. Quinine gives a distinct milkiness almost immediately in 10,000th dilution, and after 24 hours in 100,000th dilution. Morphine gives the reaction plainly enough in 10,000th dilution, but not in 100,000th. Strychnine gives it quite plainly in 200,000th dilution, as stated by Scheibler. This strychnine precipitate may be used for the chromic acid test, and the morphine and quinine compounds for the ordinary tests for those alkaloids. Bromine water, which can be prepared in a minute, is more handy than chlorine water, and answers just as well, or better, in conjunction with ammonia in the test for quinine; also in the ferrocyanide test. Fluckiger has found that it will detect one part of guanine in 20,000 of water. The ferrocyanide test (Vogel's) is not so delicate, detecting the alkaloid in 2,500 parts of water.—*Canad. Phar. Jour.*

TREATMENT OF NEW DWELLING ROOMS.—The dampness of newly-finished rooms is not due so much to the water used in mixing the plaster, as to the water of hydration of the lime, liberated by the action of carbonic acid. The action of the small quantity present in the normal atmosphere, would, however, be so slow and the water be liberated so gradually, that no injurious effect could result. But as soon as the rooms had become tenanted the large amount of carbonic acid given off in respiration causes such rapid displacement of water, and with it other matters indicated by the peculiar odor, that unpleasant and injurious results may follow. Treatment of the rooms with carbonic acid, before occupying them, suggests itself at once, as a means of rendering them rapidly tenatable. Although, by calculation, it would require the carbonic acid from the combustion of about 320 pounds of coal, to displace the hydrate in water in the walls of a room of about 1,500 square feet of surface, in practice, the consumption, in a suitable way, of about five pounds of charcoal per day, for five days, in the room, would answer, because the interior portions are protected from rapid action of carbonic acid, as soon as a layer of about one-tenth of an inch has been acted on. This is proved by the fact that Professor Fuchs has detected caustic lime in walls centuries old.—*Ec.*

Solvent Powers of Water.

Water is a physical rather than a chemical agent in bleaching and dyeing; it is the vehicle which carries the chemical substance to the cloth to be operated upon, or which removes the matters necessary to be removed from it. When a substance is mixed with water, it may either be dissolved by it, and disappear, as salt does; or, it may remain in suspension, as chalk does. Nothing is considered to be actually dissolved in water if it can settle out again, or if it will not pass with the water through a filter made of paper or calico; thus, to talk of dissolving ground chalk in water, is incorrect; for, if allowed to stand, it would settle out; or, if the mixture were filtered, the water would pass clear, while the chalk would remain upon the calico; but blue vitriol (sulphate of copper), for example, does really dissolve in water, and the liquor all filters through together; to deprive the water of the blue vitriol would require chemical means different in kind from filtration. Water, therefore, dissolves some substances and not others. Water does not dissolve the same quantity of all soluble substances; of some it can dissolve its own weight, and more; of others a small portion; and of some, extremely little. As a rule, hot water dissolves more than cold; but, upon cooling, the excess mostly falls out as crystals. This point deserves notice; for a liquor, which is of right strength when a little warm, may be too weak when it becomes cold; left in a carboy, for example, in a cold place, because the salt crystallizes out; this is the case only with those salts that are but sparingly soluble, as chlorate of potash, cream of tartar, sulphate of potash, etc. The crystallizing is sometimes troublesome in steam colors; which, right enough when freshly made, become filled with small crystals, and rough on the machine; it is felt in the case of an ageing liquor, which contains chlorate of potash as an active agent; which, crystallizing out, leaves the liquor weak and not able to do its work. As a usual thing, the drug room upon a printing or dyeing works should be cool, but there are some liquors better in a moderately warm place; brown vitriol, for example, in winter time, is apt to go solid in the carboys, if kept in an exposed place.—*Ann. Tex. Manuf.*

MOLDING SAWDUST.—The cement is nothing but glue dissolved in water. In order to prepare the material the sawdust is put in an earthen vessel, boiling water poured on it, stirred up, and left to soak for about a week, and again stirring from time to time; then it is boiled until it has attained the consistency of a paste, after which it is put in a coarse cloth and the excess of moisture well squeezed out. This material is then kept ready for use; when wanted a sufficient quantity of thin glue-water is added so as to obtain a paste, which may be pressed into molds, or rubbed into cracks or holes to disguise flaws or other defects in woodwork. When the sawdust of the same wood is used, the work carefully done, well dried and cleaned, the imperfections repaired in this way can scarcely be detected; while the ornaments made differ only in one respect from those made by carving—in not showing the grain of the wood.—*Ec.*

Some one has patented an arrangement of appliances for cleansing metallic plates covered with tin and other metals; the plate is caused by series of rollers, to pass through a casing containing bran or sawdust, on issuing from which any absorbent material which may have adhered is removed by means of brushes suitably arranged. Another gentleman claims improvements in the method of cleaning and polishing tin and other plates. After the plates have been immersed in oil, they are dipped in a hot alkaline water bath, and subsequently passed through a polishing machine, which, by means of rollers supplied with bran, or some other suitable polishing substance, imparts a brilliant finish to the surface.

TESTING FOR COPPER AND TIN.—The German Pharmacopoeia demands that medicinal extracts must be free from the presence of copper and tin. Dissolve the suspected extract in five times its volume of water, or weak alcohol, and, after adding a drop of dilute chlorhydric acid, to set in the solution a rod of clean metallic zinc. Copper will be of course indicated in a half hour by the usual color. If copper and tin be present, the rod will have a brownish tint, and if tin alone, a white color. These precipitates may be scraped off with a knife and examined after re-solution.

As a simple method of detecting adulteration of wine, into a small quantity of the wine to be tested, says *Le Temps*, drop a piece of potash. If no deposit is formed, and the wine assumes a greenish tint, it has not been artificially colored. If, however, a violet deposit appears, elder or mulberries have been used. If the deposit be red, the adulteration is sugar beet; if violet red, campeachy wood; if violet blue, privet berries; if clear blue, coloring matter obtained from sunflowers.

TRAGACANTH MUCILAGE.—The Boston *Journal of Chemistry* adds the following to the many receipts for making mucilage: Take of powdered tragacanth, 1 drachm; glycerine, 6 drachms; water, enough to make in all 10 ounces. Rub the tragacanth in a mortar with the glycerine and then add the water. This will produce a mucilage at once of excellent quality.

GOOD HEALTH.

Moisture the Cause of Periodic Fevers.

Dr. A. J. Squire advances, in *the Herald of Health*, a theory which has been before maintained as to the origin of periodic fevers; namely, that these are due, not to vegetable or animal decomposition, nor to hypothesized malarial germs, but simply to moisture. In defense of this supposition, Dr. Squire makes some very good points, and we reprint the more important paragraphs from his article, as containing some interesting observations:

There is no class of diseases more prevalent than periodic fevers. The annual number of deaths from them, as shown by the United States census for 1870, is 11,423, although an important item in our mortality list, conveys but a feeble idea of the amount of sickness, suffering, loss of time, of the impairment of health of body, of the enfeeblement of intellect produced by them.

Of the cause of periodic fevers we have had at different periods several given, to which my limits will hardly allow to allude. But in general terms, when the cause has been claimed to be gas, the objection of the law of gaseous diffusion has destroyed the claim. When it has been claimed to be produced by decomposition of animal matter, the extensive prevalence where there was no animal matter has destroyed the theory of animal decomposition. The theory of vegetable decomposition has shared nearly the same fate. The severe intermittents on the rocky shores of the Mediterranean, and on the sandy plains of Holland, have been cited as conclusive proof against it. In the more recent theories, the poison consists of low animal or vegetable organisms, a constant and indispensable condition for the growth of these organisms is moisture.

The supporters of these theories all tell us these organisms float, and are rapidly produced only "in moist air." To this theory is opposed several facts. Thus, Parks says: "It has generally been supposed that wearing flannel next the skin lessens the risk of malaria. As it is generally believed the poison of malaria enters either by the lungs or stomach, it is difficult to see how flannel next the skin can prevent its action, except indirectly, by preventing the chill in persons who have already suffered from ague. But the very great authority, Andrew Combe, drawn from experience at Rome, is in favor of its having some influence; and it has been used on the west coast of Africa with success."

Having given careful study and attention to this subject for more than thirty years, with constant association with many persons carrying so much fever tendency as to be good anemometers, and having taken their testimony as to the pernicious effects of moisture, I have been led to question all of the theories heretofore given us. I have noticed the beneficial effects of buffalo robes and overcoats during long night rides in ague districts. I have observed the occurrence of ague in fall and spring, in rooms without fires, while other inmates in other rooms of the same house, with fires, remain free; the fever only ceasing to recur on returning the stoves and warming the rooms. I have observed, too, many cases of fever caused by the dampness of newly-plastered walls, the lime and recent state of surroundings seeming to negative the supposition of either animal or vegetable production. These facts, and many more which might be cited, lead me to believe the disease dependent on moisture.

At the same time there is every reason to believe that animal or vegetable impurities in air or water are liable to undergo changes when combined with heat and moisture, and to become productive of many diseases, and to aggravate all others. It is equally probable that disintegrated tissue contained in the "twenty-eight miles" of tubing of the "seven million" sudoriferous glands, and walled in by moisture, would produce specific poison in those glands—a poison capable of producing ague, or any form of malarial fever. These fevers might be modified, like other diseases, by the quantity of the poison, by the constitution, and many other causes.

Draper cites authority for believing that a person may sleep with perfect safety in the center of the Pontine marshes, by having his room kept well heated by fire during the night. These, and other reasons to be hereafter cited, lead to the conclusion that it is not what we drink nor what we inspire that produces fevers, but that it is what we do not perspire. To illustrate: Let ordinary insensible perspiration equal "thirty-two ounces per day in dry air," and equal "three and one-half ounces in moist air." Then the difference—twenty-eight and one-half ounces—gives us a cause more real and tangible, by twenty-eight and one-half ounces, than any of the heretofore supposed malarious causes. For the most minute microscopic examination has failed to find any of the heretofore supposed causes in the eyelet.

The more carefully one will study the causes heretofore given, the more fully will he be satisfied that their beginning, middle and end is essentially moisture. They all require moisture and the necessary conditions of evaporation. Thus large bodies of water, that absorb the heat, prevent these diseases. Forests, the leaves of which detain and absorb the moisture, prevent them; while marshes, and all other

places holding moisture in the most favorable conditions for evaporation, produce them.

In conclusion, a belief in this theory would lead to improved hygiene and improved health, diminish the severity of periodic diseases, and the frequency of relapses. For when our whole force was properly directed and concentrated, we would accomplish more against moisture, considered as the cause, than when considered only as one of the conditions.

Glue as a Healing Remedy.

T. A. Field writes to the *Scientific American*: For the last twelve or fourteen years I have been employed in a shop where there are over three hundred men at work, and, as is the case in all shops of this kind, hardly a day passes but one or more of us cut or bruise our limbs. At first there were but few that found their way to my department to have their wounds bound up; but after a while it became generally known that a rag glued on a flesh wound was not only a speedy curative, but a formidable protection against further injury. I was soon obliged to keep a supply of rags on hand, to be ready for any emergency. I will here cite one among many of the cases cured with glue.

A man was running a boring machine, with an inch and a quarter anger attached; by some means, the sleeve of his shirt caught in the anger, bringing his wrist in contact with the bit, tearing the flesh among the muscles in a frightful manner. He was conducted to my department (the pattern shop), and I washed the wound in warm water, and glued around it a cloth, which, when dry, shrunk into a rounded shape, holding the wound tight and firm. Once or twice a week, for three or four weeks, I dressed the wound afresh, and it was well. The man never lost an hour's time in consequence. The truth of this statement hundreds can testify to. In case, of course, the best quality of glue.

SALT IN SICKNESS.—Dr. Sondder remarks: I am satisfied that I have seen patients die from deprivation of common salt during a protracted illness. It is a common impression that the food for the sick should not be seasoned, and whatever sloop may be given, it is almost innocent of this essential of life. In the milk diet that I recommend in sickness, common salt is used freely, the milk being boiled and given hot. And if the patient cannot take the usual quantity in his food, I have it given in his drink. This matter is so important that it cannot be repeated too often, or dwelt upon too long. The most marked example of this want of common salt I have ever noticed has been in surgical disease, especially in open wounds. Without a supply of salt the tongue would become broad, pallid, puffy, with a tenacious pasty coat, the secretions arrested, the circulation feeble, the effusion at the point of injury serous, with an unpleasant watery pus, which at last becomes a mere sanies or ichor. A few days of a free allowance would change all this, and the patient get along well.

A LECTURE was recently delivered before the society of Arts in London, by Mr. W. E. Newton, in which he attributed various virtues to peat and other vegetable charcoal. He stated that in the form of powder put upon polices, peat charcoal had been most beneficially employed in some of the London hospitals, especially in cases of offensive sores. It absorbed the putrid effluvia and was of great benefit in cancers, etc. In many cases when taken internally it was productive of good effects in disease of heart and giddiness. In all diseases of the chest, sore throat, diphtheria or bronchial affections peat charcoal has been found very useful. In France a scientific commission appointed by the government to investigate this subject has reported very favorably in regard to the usefulness of this substance for a great number of purposes.

STILL another mode of curing corns is offered. If a single one, of the thousands suggested, were really effective, we could dispense with the rest. But, so far as we know, going barefoot is the only sure cure. Dr. Barbier, says the *Lyons Medical Journal*, reports the cure of the most refractory corns by the morning and evening application, with a brush, of a drop of a solution of the per-chloride of iron. After a fortnight's continued application, without pain, a patient who had suffered martyrdom for nearly forty years from a most painful corn on the inner side of each little toe, was entirely relieved. Pressure was no longer painful, and Dr. B. believed the cure radical. Two other similar cases were equally successful.

CAMEL-HAIR BRUSHES FOR THE CLEANSING OF WOUNDS.—At a recent meeting of the Clinical Society of London, Mr. Callender brought to the notice of the society the methods he had adopted in his wards at St. Bartholomew's for the dressing of wounds. By the use of brushes, the cleansing of a wound is not a painful process. A further recommendation is that the employment of sponges and other materials commonly used for cleansing wounds, and which some eurgeneo believe to be a frequent cause of the passage of infectious material from one patient to another, is thus done away with.

To cure neuralgia, take the bark of the peach tree, pound it and steep in water. Hold the face over it, so as to thoroughly bathe it in the ascending steam. It is a certain cure.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Working Claims by Tunnel; A Convenient Book Support; California Deep Well Pump; Academy of Sciences, 145. Water for Mining Purposes; Mining Education in California; Ocean Depths; Look out for Your Claims, 152. Pipe-way Transportation; Railroad Hand-Brake; Tyho Mining District, 153.

ILLUSTRATIONS.—Morgan's Book Support; Deep Well Pump, 145. Railroad Hand-Brake, 153. CORRESPONDENCE.—Mining in Sierra and Plumas Counties—No. 2, 146.

MECHANICAL PROGRESS.—American vs. European Machinery; Vessel for Transporting Grain in Bulk; Safety Attachment for Car Track; A Solid Foundation; Important Mining Experiment; Turbine Wind Motor; Life Buoy, 147.

SCIENTIFIC PROGRESS.—Bursting of Trees and Objects Struck by Lightning; Birds and Cholera; Indicator of Vitiated Air; Sensitive Plants; Improved Manufacture of Artificial Fuel, 147.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 148.

MINING SUMMARY from various counties in California and Nevada, 149.

USEFUL INFORMATION.—Marbled Paper; Tests for Alkaloids; Treatment of New Dwelling Rooms; Solvent Powers of Water; Molding Sawdust; Testing for Copper and Tin; Tragacanth Mucilage, 151.

GOOD HEALTH.—Moisture the Cause of Periodic Fevers; Gine as a Healing Remedy; Salt in Sickness; Camell-Hair Brushes for the Cleansing of Wounds, 151.

MISCELLANEOUS.—Silver City Mining Excitement; The Volcano Mines; Oceana Smelting Works; Quicksilver Mining, 146. The Great Boulder Drift; Arizona Mines; Artesian Shaft; Indium; French Guiana; Oregon Gulch Mountain; Tasting; Chrome Steel; Tunnel; Improved Eaton Holder, 150. The Paymaster Mine—Peavine; The Kearsarge Mine; The Almaden Mines; Sticken Mines; The Mint Appropriation; El Dorado Mines; Mining Activity; To Desodorize Coconut Oil; The Swock River Mines; The New Geyser Basin; Mexican Grant vs. Railroad Grant; Deep Snow, 154. Hints to Miners; Golconda; Discovery, 155.

Water for Mining Purposes.

There has been very little State Legislation on the subject of water rights for mining purposes; that is, leaving aside the legislation for the incorporation of canal companies, for conveying water through flumes, ditches and natural channels for mining purposes, as they prevent working peculiar to mining companies. Perhaps it has been just as well for the mining interests that no special legislation has been required, and that in all the disputes the courts have laid down the rules upon principles deemed proper at the time, and these have gradually become incorporated into the jurisprudence of the State, until they are as firmly established as the principles of law regulating any other species of rights.

A few days since, however, a bill was drawn up by Northcott in relation to water supplied for mining purposes in this State which is as follows:

- SECTION 1. Where water is sold for mining purposes there shall be a uniform system of gauges.
Sec. 2. The gauge-box for 200 inches of water shall have an aperture 12½ inches high and 12 inches wide, with 6-inch pressure-board above top of orifice.
Sec. 3. In all cases where more than 200 inches of water are used, there shall be a series of gauges placed side by side to conform in general construction to the form as presented in section two of this Act.
Sec. 4. Where water is sold in quantities less than 50 inches, the gauges may be constructed on a smaller scale, but must conform to section two of this Act.
Sec. 5. In all cases where gauges are set in the main ditch or flume, the box must be constructed one-third larger than the orifice of the gauge.
Sec. 6. All water companies selling water by the inch shall be at the expense of constructing the gauges for such purposes.
Sec. 7. All gauges shall be placed as convenient to the claim where water is used as the case will admit.

THE AURIFEROUS DEPOSITS of north-western Sonora which formerly yielded large amounts of gold are again to be worked. An American company is now building a ditch for working some of these placers.

QUICKSILVER.—A good ledge of cinnabar was struck in the Carrie mine, one and a half miles south-west of Cloverdale. The tunnel is sixty feet into the hill. The rock is soft and rich.

Mining Education in California.

If some of the gentlemen of this city, who have made such immense sums out of mining property, were to donate some of their surplus wealth to assist in building up a satisfactory Mining Department in the State University, they would not only benefit a deserving institution but the whole Pacific coast as well. There are thousands of young men on this coast desirous of obtaining a mining education, and thus far they have been unable to learn more than simple assaying, etc. There is no school or college on this coast which fits young men for this business, while there is much need for one. Mining in its various branches will be carried on among us for hundreds of years to come, and we should not be dependent on foreign institutions to furnish our managers, superintendents and experts. In fact, the mining community is rather prejudiced against graduates of these institutions, and many of them find difficulty in procuring suitable employment.

Young men fresh from Freiburg, come to this coast with the supposition that they will find situations immediately at large salaries; many of them, with a good theoretical basis for practical knowledge, find mining is carried on quite differently in its details from what they have learned. A year or two spent in hard work or close observation in different mining districts will, perhaps, give them more available knowledge than years of study would do; and those who have the moral courage to give up their bright anticipations for a time, generally succeed in the end. The majority of these gentlemen, however, on realizing the situation become discouraged, and take to some other business. We have in mind numerous instances of this sort.

Now we have at our State University a better chance to establish a practical and beneficial school of mines than anywhere in the world. We are surrounded with immense fields of mineral wealth of all classes and characters, as broad in extent as they are varied in material. Mines in all stages of development with machinery embracing all the latest improvements. Metallurgical processes of all kinds being carried on on a large scale, and added to these, untold quantities of mineral wealth waiting only to be developed. It is but natural that a large proportion of the youth of the State should desire an education which will fit them to take an active and useful part in the mining developments of the future.

The mining department of the University is at present in a condition not at all commensurate with the interests it represents. In fact, as far as we know, very little has been done to extend the branches of this department, or make it of a prominent or beneficial character. This, not so much from lack of energy as lack of means, and suitable appliances. Moreover, the University is, as yet, rather young to have established a school of mines which will compare favorably with those of similar institutions elsewhere. Still, this should be done; and we ought to inaugurate and build up the best school of mines in the world. To do this, however, money is needed; more professors; a good "plant" of the various kinds of mining machinery; the attendance of practical men to work them; a good collection of mineral specimens; a technical library, etc. The extensive collection of minerals made by the State Geological Survey, belongs to the University, and they should be properly displayed, serving as a nucleus for a still more valuable collection and as an assistance to the student in his labors.

It only needs the co-operation and support of one or two gentlemen of wealth to put this department on a proper footing and attract more attention to it, when it will receive more than one gift from other sources, and be not only a credit to those who benefit it but to our state as well. If donations of this character are made, as we hope they will, it would be very advantageous to set apart a fund to take the class into the mining regions once or twice a year. By this means they would be able to see mills and furnaces in practical operation on different classes of ore; mines of different minerals being worked on peculiar systems; compare the methods of mining and milling and their advantages; and the results could not fail to be of value not only to them but to the mining community, who are better workers than writers, as a general thing.

Here is a first-rate chance for some one or two of our millionaires who have made their fortunes in mining operations, to cause their names to be remembered with gratitude for all time to come, and to benefit the interests to which they owe so much. If some half dozen men we could name would donate their incomes from mines for only one month each, it would suffice to found a mining department at our University which would eclipse anything yet known. It is in the right place and has the right surroundings. There would be no lack of students if the opportunities for studying were such as they should be. Geological tours could be made here in the summer months in the mining districts and studies carried on in the winter. Machinery would be needed at the University and opportunities for testing and working various kinds of ore. They could get all of that they wanted free of cost, and the practical experiments they could make by comparing different methods would be of value. Of course the corps of professors would have to be enlarged and the facilities for pursuing this branch of study extended. Who will be

the first to help this cause along, and assist in establishing a department which will do credit to our State?

Ocean Depths.

The subject of ocean sounding and dredging is an interesting one, and with the improved appliances now in use the latter subject, especially, is furnishing plenty of work for scientific men. The soundings taken in the Atlantic ocean on the occasion of laying Telegraph cables give us a good idea of the contour of the bottom of that ocean, but as yet, no thorough work of this character has been accomplished in the Pacific. The U. S. Steamer, "Tuscarora," is, however, now engaged in this work, and was in Honolulu on the 2nd ult. The result of the soundings taken from that vessel will be of great interest when compared on charts with those of the Atlantic ocean.

In the neighborhood of the continents the seas are often shallow; thus the Baltic sea has a depth of only 120 feet between the coasts of Germany and Sweden. The Adriatic, between Venice and Trieste, has a depth of only 130 feet. Between France and England the greatest depth does not exceed 300 feet, while southwest of Ireland it suddenly sinks to 2,000 feet. The seas in the south of Europe are much deeper than the preceding. The western basin of the Mediterranean seems to be very deep. In the narrowest parts of the straits of Gibraltar it is not more than 1,000 feet below the surface. A little farther toward the east the depth falls to 3,000 feet, and at the south of the coast of Spain to nearly 6,000. On the northwest of Sardinia, bottom has not been found at the depth of nearly 5,000 feet.

In the open seas, however, much greater depths are found. Some 250 miles south of Nantucket 7,800 feet have been found, and in north latitude 78 degrees Capt. Ross found it over 6,000 ft. in Baffin's bay. In the Southern Atlantic the depths are great. West of the cape of Good Hope 16,000 feet has been reached; and it is stated that the plummet has not found bottom at 27,000 feet, west of St. Helena. In the Pacific, what soundings have thus far been made indicate great depths. They also show some unusual phenomena.

In the soundings made by the "Tuscarora" last year it was found that a sudden descent was met with down the entire coast, varying from 20 to 70 miles out. It slopes from the coast out from 100 to 400 fathoms, and then suddenly drops down into an immense depth. Near this point this great bench or plateau is reached a short distance from the Farrallone Islands, where the bottom suddenly descends to a depth of two miles. Off Cape Poul weather a precipitate descent from 400 fathoms to 1,500 fathoms is met with, when the plateau continues as level as a floor for hundreds of miles to the westward. Thirty miles from the Golden Gate the bottom is reached at 600 feet; at 55 miles it descends to 10,200 feet; and at 100 miles out the enormous depth of 15,248 feet has been measured without reaching bottom. In the sounding taken on the "Tuscarora" on her recent trip between this port and Honolulu, the greatest depth found was 13,324 ft., or about 3½ miles. This was near the Islands. Altogether 62 soundings were taken at an average of 40 miles apart. The quickest time made was in a sounding of 15,392 feet, in 1 hour, 28 minutes and 8 seconds. These soundings were made with an improved apparatus which brings up each time a specimen of the soil or the ocean bed.

At the last meeting of the California Academy of Sciences Professor Davidson, of the U. S. Coast Survey mentioned the fact, that the average depth of the Pacific ocean had been determined in 1855 by Professor Bache of the Coast Survey, from the discussion of the observation of the transmission of the great earthquake waves of December 1854. The subject is not new, but is worth repeating in connection with the present subject. The character of these earthquake waves being ascertained, and also the time of their transmission, the average depth of the ocean in their path can be determined.

The rate of motion of the crest of the wave from Simoda to San Diego was 370 miles per hour or 6.2 miles per minute.

To San Francisco it was 355 miles per hour or 6.0 miles per minute.

The duration of an oscillation on the San Diego path was 31 minutes; the duration of oscillation on the San Francisco path was 35 minutes. These data yield, for the length of the wave on the San Diego path 186 to 192 miles; and on the San Francisco 210 to 217 miles. Now a wave of 210 miles in length would move with a velocity of 6.0 miles per minute, in a depth of 2,230 fathoms; and a wave of 217 miles in length would move with a velocity of 6.2 miles per minute, in a depth of 2,500 fathoms.

In a similar manner was derived the average depth of 2,100 fathoms on the San Diego path.

THE WARING ROCK DRILL company are about introducing their improved drills in the mines of this coast, as will be seen by advertisement in our columns. The inventors of this drill claim for it economy, durability and comparative cheapness. We will shortly illustrate and describe it in detail for the benefit of our mining readers.

THE 1,500-foot level of the Crown Point mine gives promise of a very rich ore deposit.

Look out for Your Claims.

We desire to call the attention of our readers to the fact that in three months from now if the requisite amount of work has not been done on claims located prior to the passage of the act of May 10th, 1872, those claims will be open to re-location in the same manner as if no location had ever been made. We mention this at this date, that those of our mining readers who have neglected to make the necessary expenditures to hold their claims, may be prepared to do so in time to save their property from re-location. Before the time for this annual expenditure expired, and before the time was extended last year, a number of different parties had organized a regular crusade to take possession of claims upon which work had not been done, and we do not doubt but they are still on the lookout for such opportunities. In order that the matter may be well understood, we will quote what bears on this subject from Section 5th, of the Mining law of May 10th, 1872:

On each claim located after passage of this Act, and until a patent shall have been issued therefor, no less than \$100 worth of labor shall be performed, or improvements made during each year.

On all claims located prior to the passage of this Act, \$10 worth of labor shall be performed or improvements made each year for each one hundred feet in length along the vein, until a patent shall have been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and upon a failure to comply with these conditions, the claim, or mine, upon which failure occurred, shall be open to re-location in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns or legal representatives, have not resumed work upon the claim after such failure and before such location.

The law then provides that if any one of the several co-owners fails to contribute his proportion of expenditures, upon certain measures being taken, he can be ousted from ownership.

After this law was passed it was found best to extend the time for the first annual expenditures upon claims located prior to the passage of the Act, and an amendment to the original bill was approved on the first of March, 1873, extending the time for the first annual expenditures, on claims located prior to the passage of the Act, to the Tenth Day of June, 1874.

By this it will be seen that if the work is not done, or begun, on or before the tenth of June, this year, the claims will be open for re-location, unless the original locators have resumed work on them. This being the case miners had better begin now to look out for their claims.

BOILERS AND TANKS.—A section of the new city charter process for the appointment of an Inspector of Steam Boilers and Tanks, to be appointed in July, 1874. The supervisors are required to publicly notify all owners, controllers or users of steam boilers or steam tanks in the city not subject to the United States Boiler Inspector, giving its location and full details of age, construction, capacity, etc. The Inspector must, once a year, and oftener if circumstances require, thoroughly examine each boiler and tank, and afterward, if the apparatus sustain unimpaired his tests, he is to issue an official certificate to that effect. He is to give five days' notice of his intention to make an examination; though the owner may waive the right of notice if he thinks fit. The Inspector will report quarterly to the Board. He must in each case carefully test the safety-valves and the weights thereof, and having done so, any person who shall thereafter increase any such weights so tested, or in any manner change them, shall be deemed guilty of a misdemeanor, and upon conviction shall be punished by a fine of not less than \$25 nor more than \$500, or by imprisonment for the term of not less than six months, or by both fine and imprisonment at discretion of the Police Judge. If the Inspector become satisfied that any gauge, pump, safety-valve, or other appurtenances of safety or indicator thereof, is not such as to warrant his issuing an official certificate, he must immediately notify the owner of the boiler or tank, or the person having control of it; after which notification, the boiler or tank is to be deemed unsuitable for use, until the change therein shall have been accomplished to the satisfaction of the Inspector. The use of a boiler or tank for which a certificate has been refused is made a misdemeanor, punishable as above stated, and each day's use is to be considered a separate offence. Owners or controllers of boilers and tanks are required to furnish at their own expense such assistance in effecting a test as the Inspector may require.

GUNPOWDER.—In our issue of January 17th, we mentioned some facts in connection with the expensive works of the Ladin & Rand Powder company, and also stated that Messrs. Kahath & Ladd had assumed the agency of the company on this coast. As will be seen by the advertisement published on another page of this issue, these gentlemen have just received a fresh supply of Eastern iron-grip powder, patent safety fuse, electrical fuse, rubber tubing, caps, connecting wire, etc. The blasting apparatus made by this company is especially worthy of examination by mining men.

Pipe-way Transportation.

Pipe-way transportation is coming into favor in the oil regions of Pennsylvania, to carry petroleum oil from the wells to stations on the railway. The longest pipe-way is 15 miles, overcoming 460 feet of elevation by steam pressure at the entrance to the tube. This system of transportation is so independent of weather and had roads, and so preventive of leakage, and gives so thorough satisfaction without any drawbacks, that public attention is directed to many other practical applications of the same system.

Twenty-five years ago, on the national road, between Cumberland and the bituminous coal-field beyond, we saw a small rivulet turned to similar account in the cheap transportation of coal. A zigzag, $\frac{1}{4}$ inch-board flume, followed the tortuous course of the petty stream and carried 6 inches depth of water and 12 inch surface. A dam collected water enough to make two runs of coal a day. Each run bore in its current 30 tons of coal, fed from a chute with a rake. The distance was under 5 miles; the fall was at least 20 feet to the mile. The coal floated along with ease, carrying with it chunks of slate and conglomerate rock. There were chutes for its reception on the turnpike. These had screens, over which the coal passed, being perfectly cleansed and polished before entering. All day long wagons were self-loading under these chutes. The cost of transportation over the water-way was merely nominal. It was an easy step for invention to suggest pipe-ways, for similar transportation of fluids; and for mails and packages, by pressures of condensed air, as now used in London.

It is not generally known that in France the pipe-way system has been used for ten years past in transporting beet juice from this field to the sugaries. The sugaries at Cambria work up annually 246,000 tons of beets; they are supplied with beet juice through 62 miles of pipes, now being extended to 100 miles, in many ramifications.

At points central to cultivation, works are erected for rasping beets and expressing the juice. Milk of lime is immediately added to prevent decomposition; and after inspection and measurement the saccharine stream is turned into the pipe-way and delivered at the terminal sugaries, the long contact with lime and the thorough agitation purifying the juices more perfectly than usual. It is estimated that during 1874 there will be a total length of such pipe-ways of 560 miles, doing service between the scattered beet fields and the condensed sugarie works of France.

The pipes are placed two feet eight inches below the surface, and steam engines compress the air as desired. All degrees of elevation are thus surmounted. The juice has a gravity of one degree Baumé on entering, and the same when discharged.

This pipe-way system so economises sugar-making that it wonderfully multiplies the sugaries. No investment excels that concerned in this production. Farmers find it far better than other crops. Pipe-way stocks are in high favor, and sugaries pay best of all.

If new industries are needful to this future progress of California, here is one that should be considered. It offers a wide field for expansion, without risk of oversupplies; and if the right soil be selected, the crop is sure, and the profits of sugar-making are more than usually reliable.

Improved Railroad Hand-Brake.

We illustrate herewith an improved form of railway hand-brake, which, it is claimed, saves fully two-thirds of the distance run and time occupied while setting brakes. It is also stated to be much safer in use than the ordinary "twist up" arrangement, as it is placed from three and a half to four feet from the end of the car roof, so that, in case of accident, there is less danger of the brakemen being thrown between the cars.

The device is quite simple, and consists of a bed plate, to which is pivoted, in lugs, a segment, A. On the latter is formed a hook, to which the brake chain is attached, and also a fork, B, for guiding the same. C is a wrought iron lever, connected with the segment and provided with a steel lip to engage in the teeth of the rack, D. The brake chain passes from the hook on the segment over a pulley, journalled in snitshle hearings cast with the bed-plate, and thence down under another pulley, secured as shown under the car, and so to the brake. The arrangement on the roof of the car is, secured by but two bolts; and having merely a single motion, can necessarily be quickly operated.

From our engraving, giving two perspective views of the apparatus, and also showing how it is applied, a clear idea of its construction will be obtained. It appears strong and durable, and according to the inventor, is not expensive. Patented by Mr. W. S. Foster, of Foster's Crossings, Warren county, Ohio; who may be addressed for further particulars.

BLUE-STONE AND ACID.—The Carson acid factory has been enlarged, and now runs 24 vats, turning out a ton of blue-stone per day. The Mint consumes about a ton of sulphuric acid daily, and will soon require half a ton more, and it was in order to meet this demand that the factory works were enlarged.

Tybo Mining District.

Its Mines and Mineral Resources—The Two G, Casket-Crosby and La Fayette Mines Sold to John B. McGee for Ninety Thousand Dollars. To be Stocked in London.

(Written for the Press by J. D. P.)

The mining district whose name heads this article lies 80 miles due south of Eureka, 12 miles south of Hot orsek and 35 miles south-east of Belmont, the county seat of Nye county, Nevada. It was prospected and organized as a mining camp about the latter end of 1855 or beginning of 1856, and was, besides, originally ambitiously dubbed Empire District. The dream of this far-seeing, though perhaps, as yet unrewarded prospector, who thus bestowed upon it the baptismal font, whose invigorating waters were drawn from its own everlasting hills, appears as though it was to be realized at last, for its mineral wealth will soon, no doubt, win for it in the near future the empire distinction he claimed for it then. But it is under its aboriginal appellation and not its Anglo-Saxon one that it will in future be known to mining men. Tybo will, therefore, descend to posterity through the mining annals of the

carrying some sulphurates, while the latter carry both sulphurets and lead, and of the latter, one of the four mines already mentioned will carry about 25 to 30 per cent. and will also yield sufficient iron to facilitate their being readily and profitably reduced in the furnaces. The extent and value of the ore deposits of these four mines are almost beyond computation though their measurement, by the usual method adopted by all experts to find the cubical contents of lodes and deposits of ores will, when applied by-and-by, give us some approximate figures upon which to base future calculations.

Ninety-Seven Thousand

Dollars is a large sum 'tis true, but though large, it is hardly an equivalent for the property for which it has been exchanged. Of this amount a trifle over one-fifth was paid down in hard coin at the bank at Belmont, while the remaining four-fifths (77,600) are to be paid on the 1st of next November. This is ample time in which to prove the value of the property, and to receive in return for it, a sum equal to the above amount with which to cancel it.

The Two G

Mine itself exhibits sufficient ore now to more than quadruple the above sum in that time, could it be extracted and reduced and turned into bullion. It contains 1,200 lineal feet; and

FOSTER'S RAILROAD HAND BRAKE.

State; while those swarthy children of the wilderness, to whose language it belongs, will have passed away before the superior civilization of their pale faced brothers. What is the origin or source from whence the name is derived, or what its correct meaning is, I have no means of knowing. It is likely enough a derivative contraction of some of the many euphonious Indian words, or names with which one meets with in the nomenclature of the out-of-the-way towns and camps of this land of sage-brush and silver. To miners, more than to all the other men in this State must be attributed this singular fertility of imagination in coining the new and expressive terms which they seem to delight in bestowing upon the mining claims, towns, and camps which everywhere spring up with mushroom-like rapidity, wherever they find the glittering ore in sufficient quantities to recompense them for their time and trouble in delving after it in the subterranean caverns they themselves have created.

Tybo.

Is segregated somewhere along the elevated chain, known as the Hot creek mountains, running south east of Belmont and about eighteen miles north of Reville District, and until quite recently did not begin to loom up above its own horizon. Now, however, it is about to obtain some prominence, the sale of the four mines cannot fail to attract to it, no small amount of attention from capitalists, during the coming summer. Active operations are to be commenced upon these mines by the first of May, for they are in the hands of the right sort of men to set them immediately in motion, and to commence without delay the construction of the necessary buildings and reduction works.

The Ores of the District

Are both milling and smelting, the former

The Assay Value.

Of the ores gives an average of \$100 per ton. Now if we assumed this standard of value to be reduced 30 per cent in the process of smelting, though it is a large reduction, still for illustration's sake we will adopt it as a rock upon which to rear our argumental figures, and try and prove, by them to our own, and the readers' minds, the vastness of the wealth lying within this walls, of these 3,300 feet of vein matter.

Therefore 40,000 tons of ore at \$70 per ton will give \$2,800,000. Deduct for extracting, reducing, coal, superintendency, etc., \$25 per ton, which will leave \$1,000,000, and we will have still a total of \$1,800,000 left, with which to pay for the property and construct the necessary buildings, engines and reduction works, and leave besides a princely sum to go in dividends to shareholders; and all this from only 1,200 feet long by four thick and 125 feet in depth. Say that these 40,000 tons will leave a profit of only \$20 per ton, and we have still the enormous figures of \$800,000 to laugh and grow fat on.

These figures will, I think, demonstrate to the thinking mind the magnificence of this property, which cannot fail to be highly remunerative to its English incorporators.

The Supineness of San Francisco Capitalists
When viewed in connection with this property is certainly singularly strange, to say the least. To have allowed it to remain there lying idle during the past six or seven years without making hardly an effort at negotiation, does not speak well for their sagacity and enterprise. We wonder what they will think of the shrewdness of their trans-atlantic cousins now, whom they have allowed to out-strip and out-wit them in the race for the possession of the above described mines. We say in the race, because we are well aware that a few San Francisco men were thinking of raising the mortgage that was on them when John B. McGee put in an appearance with the cash at Belmont last January.

That these mines will in a short time prove themselves to be the best in Eastern Nevada admits of no doubt whatever. Wood and water, two important elements to insure success, are largely abundant on this property. Millions of cords of the former are at present growing very luxuriantly on the slopes and crests of the adjacent mountains, thus affording an excellent chance for coal producers and others to make money. It is thought that charcoal can be profitably laid down at the furnaces for a maximum of twenty-five cents per bushel the year round, instead of thirty cents per bushel as it rates at here. The furnaces can be constructed at the tunnel's mouth and the ore run out through it and dumped into the ore bins ready for the feeders, thus effecting a saving of no inconsiderable sum annually in the mere matter of hauling and transportation expenses alone. The honor of the inauguration of this new and magnificent enterprise belongs exclusively to our worthy fellow townsman John B. McGee, of the Richmond. He it was who projected and consummated the purchase of these mines, and he it is who goes down there to take charge of them next April, to make them, it is to be hoped, what the Richmond is, the most incomparable mine in all of Eastern Nevada.

Eureka, Nevada, March 1, 1874.

PLACER MINING.—A correspondent asks us to give a description of the best-known processes of saving gold in California placer mining. He also wants information as to under-currents. We will shortly give a very exhaustive and fully illustrated article on the subject of hydraulic mining in California, which will answer the queries of our correspondent in full. It will, without doubt, be the most comprehensive article on the subject ever published, and is from the pen of a practical miner of twenty years' experience. We shall begin its publication within a few weeks.

A BAD FIRE.—The miners who have been for the last two months fighting the fire at the Empire mine, near Wilkesbarre, Penn., closed work on Monday, 2d inst., when a most extensive cave of the mine occurred, exceeding in extent the fall of the Baltimore mine a short time since. Great consternation prevails in the neighborhood, and families are preparing to leave. The fire has now free scope, and threatens to ruin utterly one of the most valuable mines.

THE SILVER CORD.—The Superintendent of this mine, which is in Idaho, writes that work in the mine is moving lively. They have contracted for the sinking of a main shaft 100 feet at \$13 per foot, and are getting down fast. They have contracted for work in the third drift at \$3.50 per foot, which is progressing rapidly, in a good character of rock, which will mill from \$90 to \$100 per ton. Within 35 days they will have the shaft down so as to begin running the 4th level.

We call the attention of those desiring to purchase the Selden direct-acting steam pumps, to the advertisement of the manufacturers, in another column. The proprietors assert that as a mining pump it is unsurpassed.

Those desiring the peculiar class of chemicals, etc., mentioned in the card of Dr. J. W. Feuchtwanger in our advertising columns will do well to correspond with that firm.

The Paymaster Mine—Peavine.

This mine is now regarded as the principal one in Peavine District, and as its future success or failure will effect the whole district, a review of it may be of interest to our readers. The ledge was discovered by an old prospector named John Poe, whose history since has been varied but little from that of most all prospectors. Upon the surface there is but little in the appearance of the rock to indicate the presence of mineral, and, in fact, the assays of samples from the surface were not very encouraging—the average being only \$11. In sinking upon the outcroppings a short distance water was met with, and people having no confidence in the ledge. Poe was unable to provide even the simplest and cheapest means of keeping the water out of the way of sinking, and he therefore commenced driving a tunnel to cut the ledge. After several months the tunnel was driven over 400 feet, and the ledge was cut at a depth of 45 feet. The walls are gneiss and porphyry. The ledge pitches to the west at an angle of about thirty degrees. The walls, where unbroken, are smooth and true, and there is upon the foot wall a stratum of clay and gang, which is always regarded as favorable in any mineral vein. The width of the ledge varies from two to ten feet so far as prospected, and a chimney of ore over 150 feet in length has been opened. A shaft was raised to the surface for air, and considerable ore taken out above the tunnel. Assays ranged from \$10 to \$1,100, but the average of the ore body was about \$65—about \$7 gold and the balance silver.

In the mean time a mill had been erected, and about the first of December last commenced crushing the ore. Although a very complete and substantial mill of its class, it was soon discovered that it was entirely inadequate to the working of the ore. The ore is quite base, carrying iron and sulphur, a small percentage each of lead, antimony, copper and zinc blend. Finding that the ore was not free milling, roasting in kilns in the open air was tried, but the process being very imperfect was also a failure. The mill was shut down, and samples sent to the Auburn Mills, near Reno, for working, where, by the Stedefeld process, 85 per cent. of assay value was saved, and the result was \$60 to the ton. Samples were also sent to a mill or furnace in Oakland, which worked it to 90 per cent., and returned \$67 per ton. These samples were a fair average of the ore body in the mine, at the present level of working. Before making any further improvements in the mill for working the ore, the company wisely concluded to prospect their ledge 100 feet deeper. A shaft is now being sunk for that purpose. A steam pump, supplied with steam by a pipe from the boiler in the mill, has been placed in the shaft, and sinking is now progressing favorably. Advances dated yesterday are to the effect that the foot wall has just been reached—that over five feet of rich black ore has been cut through, and no water to interfere with sinking has been met. If, when the next level is reached, a body of ore as rich as that at the present is found, and no experienced miner who has examined the ledge has any doubt of it, the proper additions will be made to the mill, and then another bullion-producing mine will be added to the list of the wonderful resources of the Silver State. The mine is owned by the Consolidated Poe Mining Company, whose office is at Reno. Mayor Joseph Brown, of St. Louis, is the President of the Board of Trustees; Wm. Duck, of the firm of Manning & Duck, Reno, is the Vice-President and in charge of the business management; Jas. H. Kinkead, the right man in the right place, is the Secretary, and Wm. B. Bourne, an experienced miner, is the Superintendent.—*Truckee Republican*.

THE KEARSARGE MINE.—The owners of this mine, who are principally Vallejoites, we are glad to say, have probably the richest quicksilver lead in the State. The ledge has been developed about sixteen feet in width and thirty-nine in length, laying bare a deposit of a very high grade of cinnabar. The rock which holds the metal is of a soft, clay-like substance, not unlike soapstone. Besides the cinnabar, the rock contains a large per cent. of native quicksilver; a person may take any piece of the ore and knock it against the table, and hundreds of minute globules of the liquid silver will jar out of it. The earth about the ledge is so rich that a pint of dirt will yield one ounce of quicksilver by the ordinary panning process. We understand that the ledge has been struck at a distance of 125 feet below the first level, which latter is about 35 feet from the outcroppings. We are pleased to chronicle such favorable developments, both for the sake of our townsmen who are interested and the interest of our neighboring county. These results have already set a tide of immigration into Lake county, and the city of Middleton, from which the Kearsarge is only three and a half miles, is beginning to assume the proportions of a city. The mine is now under the management of good men, who, as in everything else they undertake, mean business.—*Vallejo Chronicle*.

THE TUMSEH MINING COMPANY, of California, have received a United States patent for their mine and mill-site. The original location covers an area of 30 63-100 acres of ground, to which they have lately added, by purchase, 4,500 feet along the ledge, with additional mill-site locations on Gopher Creek.

The Almaden Mines.

The San Joss *Mercury* has the following interesting facts concerning the New Almaden mines:

"The working of the New Almaden mine of this county, was commenced in May, 1846, and, as appears by the facts developed in the course of the litigation, there was expended during the first few years in opening the mine, erection of reduction works and other buildings, the sum of \$978,114, during which time the product of the mine realized \$535,540, leaving a deficit of \$442,574. It afterwards paid to the parties then in possession a large annual revenue. The total production of quicksilver from the mines during the period of twenty-one years and three months, exclusive of the time the New Almaden was closed by injunction, has been as follows:

New Almaden, to October 30, 1863..... 314,276
 Escondido, 1860 to 1863..... 10,571
 New Almaden and other mines on the property worked by the present company from November, 1863, to December, 1873, inclusive..... 258,874

Total..... 583,729
 flasks of quicksilver of 76½ pounds each, or 44,654,656½ pounds. From July, 1850, to October 30, 1863, excluding two years and three months that the mines were closed by injunction, there was roasted in the furnaces 104,659,442 pounds of cinnabar ore. Percentage yield of quicksilver being for the first year of the working, 36.74, and for the last year of this period it was 18. The company now in possession took control of the mines in November, 1863, and for the first two years and two months of their working produced 94,130 flasks of quicksilver, the ore yielding 14 and 11 per cent. for the years respectively. During the total ten years and two months it has worked the mine there have been roasted in the furnaces 237,237,613 pounds of cinnabar ore. Percentage yield of quicksilver for the first year of their working being 14, and for the last year about 5. The product for 1864 and 1865 was distributed as shown below:

	Consignments,	Sales,	On hand, Dec. 31, '65,
China.....	27,200	9,350	17,250
Mexico.....	15,752	9,302	6,450
Chili.....	4,673	2,073	2,600
Peru.....	9,200	3,700	5,500
Australia.....	200	100	200
London.....	12,000	1,500	10,400
New York.....	8,000	4,500	3,500
Oregon.....	810	261	49
Nevada.....	12,740	12,740
California.....	3,955	2,070	1,885
Totals.....	94,130	46,293	47,834

It will be noted that the sales in California were a mere bagatelle, and that nearly all the product was exported and brought money to the State from foreign sources. During these two years there was expended in this county and San Francisco, for mining expenses, payroll, supplies and improvements, \$1,887,383.89, besides large sums in settlement of old claims to the property and the payment of State and county taxes. The total expenditures in California, mostly in this county, for mining expenses, pay-rolls, supplies and improvements from November, 1863, to December 31, 1872, have been \$5,412,561. In addition, the sum of \$133,557 has been paid for taxes in Santa Clara county. The statistics furnished of the exports of quicksilver only date from 1852; from that time to the end of 1873, the exports by sea and railroad, other than to Nevada, show a total of 506,419 flasks, mostly sent to foreign countries. The mine, under the operations of its present owners, has paid its stockholders only one dividend, \$492,950 in 1865; and in 1870 it received from stockholders an assessment of \$214,565.

STICKEEN MINES.—A gentleman of this town, a few days ago, received letter from an acquaintance at Fort Wangle, at the mouth of Stickeen river, dated February 3d. The letter states that there is a great excitement about the mines on the Stickeen river, and that the general impression is that the diggings are rich and extensive. One hundred men left for Wangle for the mines the day the letter was written. Each man took four hundred pounds of tools and provisions. They go in canoes as far as the ice will permit, thence draw their packs on hand sleds to the mines. On last Tuesday another letter was received by the same person. In this last letter the writer states that a number of natives were recently employed to work on some of the claims from which from six to ten ounces per day to the hand were made last Fall. The receiver of the above letters, who has resided several years in that region, tells us that he would not advise a rush to that place; that nineteen out of every twenty who go there will surely be disappointed.—*Silver State*.

THE MINT APPROPRIATION.—The telegraphic report that the Secretary of the Treasury recommends that \$234,000, appropriated for the erection of the Mint in San Francisco, be made available, is explained by the fact that there is a general law which provides that money appropriated for public buildings shall revert to the treasury if not used within a limited period. The sum of \$1,500,000 was appropriated for the San Francisco Mint, and \$1,230,000 have been expended. The sum of \$1,266,000 in all has been used, as about \$36,000 is necessary to pay contractors, leaving \$234,000 of the original appropriation which cannot be used without an enabling act of Congress, the time having expired. The bill for this purpose has passed the House of Representatives.

El Dorado Mines.

A correspondent of the *El Dorado Republican* writes as follows from Georgetown: "Thinking that mining news from this quarter would be acceptable to you and your readers, I will say that the heavy rains this winter have furnished water for all to mine who wish, and mining operations have been active. The other day I heard the shrill whistle at the Taylor mine, and thought I would go down and see what our friend Burlingham was doing. Well, he just told me to get into the bucket and go down and look for myself. So down I went, and found the main shaft down about 350 feet, and sinking going on at the rate of about two feet per day. I found a well defined ledge at bottom of shaft, from four to five feet thick, showing well in free gold and sulphurets, with all the indications of a first-class mine. The shaft will be continued down until it is 408 feet deep, when a level will be opened each way from the shaft. They will also open a level at 200 feet. Levels have already been opened at one and two hundred feet, but so far no stopping has been done below the 100-foot level. So you see that when the shaft is completed, the company will have the mine in good shape for future operations, and the shaft in depth will be the second deepest in this county—the St. Lawrence being 670.

The Taylor Mill & Mining Co. have a 30-horse power engine, and suitable hoisting works, and 6 inch Cornish pump; they have a mill of five 700 pound stamps, with frame and cam shaft and cams, all complete, for another battery of same size, which will be set up by the time the shaft is completed; and as soon as the mine is opened at the three and four hundred feet levels, ten more stamps will be set up, making a No. 1 20 stamp mill. No one now has any doubt about the future success of this mine; depth is what was wanted.

After making an examination of the Taylor, I took a walk about four miles due southeast along the line and croppings of the ledge, which brought me to the celebrated St. Lawrence mine. Here I found 25 stamps pounding away night and day, and the main shaft down 670 feet, and going down at the rate of ten feet per week. When completed, the shaft will be 820 feet. The ledge in the shaft varies from 5 to 7 feet. As soon as the 400-foot level is opened the sinking will be continued, and the 100-foot level will be reached during the year 1874. It is needless for me to say anything about the yield of this mine, the regular shipment of bullion speaks for it. A mine with anything in it must pay with such an able Superintendent as Rodda. He is the right man in the right place, and feels deeply interested in the success of the mines in our county. I think it would be well for you to urge, through your paper, the importance of sinking deeper down on our quartz mines, for now that the St. Lawrence and Taylor have depth, justice has at length been done to our county.

MINING ACTIVITY.—On all sides are heard the notes of busy preparation among our mining population, and active operations will be commenced on an unusually large number of mines as soon as the weather will permit. Notwithstanding the very unfavorable weather which has long prevailed, much work is being done even now on what are generally spoken of as "outside mines." No fair day is lost; and, where the works are sufficiently advanced to afford shelter to the workmen, work progresses steadily, storm as it may. The prospecting that will henceforward be done in this vicinity will be of the most thorough and substantial character—no mere surface scratching. The day of such superficial prospecting is past. If mere tickling the surface would find ore, there would now be seen scores of paying mines on every hill. This has been thoroughly tried, and the result has been pretty much the same as though an "ore witch" had walked over the country, twirling his forked stick; nothing more has been discovered than appeared upon the surface. In this region, the superficial appearance of the country is much the same in one place as in another. A man might a thousand times walk over and view the ground immediately over where the Belcher, Crown Point, Consolidated Virginia, Ophir and other companies are delving in their richest ores, and he would observe nothing different to what is to be seen above the Mother Goose, the Flying Jackass, and other mines, the hidden wealth of which remains to be revealed. What is now to be done, is to locate upon the mineral range and go down at once to such a depth as to pass below all surface disturbances, and reach a zone in which veins are liable to be found, in place in the firm foundations of the hills. Even then, paying veins may not be found, but if to scratch the surface were all that is required to find mines, there would now be no need of doing any more work, as the whole country has been very thoroughly scratched.—*Enterprise*.

TO DEODORIZE COCOANUT OIL.—The following has been recommended: To one pound of the oil add one ounce of freshly-calcedined bone-black and half an ounce of calcined magnesia. Let it stand in a warm place, with frequent agitation, during three days. Allow it to settle down or filter through paper in a funnel provided with a double jacket holding warm water. During the maceration with bone-black the oil must be kept just warm enough to remain in the liquid state.

HYDRAULIC MINING is on the increase in Little York Township, Nevada county.

The Swock River Mines.

From the letter of a correspondent of the *Walla Walla Union* we make the following extracts:

The news from the Swock is meagre. There are men who have been at work all winter, when the weather was favorable, but there has been, during the month, much unpleasant weather—snowing or raining nearly every day. One who has been there all winter informed me that there was but little time that he could do anything. A company of Frenchmen most of them from Montana, have been doing considerable work opening up claims, by cutting drain races. They have spent much time on the lower fork, called Williams creek, and have not found anything to encourage them to remain there. It is too deep to the bed-rock, which seems to be very smooth. They have gone down 18 to 24 feet. They say if there is any pay on that creek it is very spotted. They have now gone to work on the Swock proper, and have got 10 claims to open up on shares, making 2,000 feet on the creek. They are at work now cutting a drain the whole length of their ground. Here they will have less work as the bed-rock is only 6 to 7 feet deep. The discovery party have been at working this winter, making from \$5 to \$10 a day. Sometimes they had to heat the water from the rooker. They are now fixing their sluices in position to go to work on an improved scale. There are other parties who have been at work this winter sawing lumber for sluice boxes, and fixing otherwise to commence work when the weather shall have settled, but in a mountainous district like this there is likely to be much rough weather for the next two months. The Swock has been prospected for a distance of 15 miles above the discovery with encouraging results. But no work has been done at the head of it to prove its value. As yet it is all a matter of conjecture and hope. The latter, all know, very often enters largely into calculations that are greatly spoiled by actual experiment. Ledge hunters will start out as soon as the spring weather will warrant, to hunt up the spot where this gold has broken off. The belief is strong that there is a ledge of great value where this gold came from. It is to be hoped they will find it, and in less than twelve months there will be many fortunate possessors of competency from these mines.

THE NEW GEYSER BASIN.—That a new and most important geyser basin has been discovered in Eastern Montana, seems now unquestionable. It was visited last fall by the well known mountaineers Jack Baronett, John Dunn and John Allen. It is represented as much more extensive than any of the already explored basins, and to contain geysers of much greater force and volume than any yet described by tourists. One of these newly discovered geysers is estimated to throw a volume of water forty feet in diameter over five hundred feet high, and to continue in eruption from ten to fifteen minutes. It is also reported that in this newly discovered basin there are "mud volcanoes" far surpassing in volume and eruptive force those on the Upper Yellowstone. This unexplored spot of the most wonderful of all our national wonders is about twenty-five miles southeast of the summit of Mount Washburn, from which point the greater geysers, when in action, when the air is clear, are visible to the naked eye.—*Avant Courier*.

MEXICAN GRANT VS. RAILROAD GRANT.—Judge Wheeler has decided that a patent from the United States Government for lands held under a Mexican grant is superior to a Congressional grant of the same land to a railroad company. The case in point is entitled *W. S. Bailey against the Central Pacific Railroad Company*. The action was brought to quiet title to lands in Sacramento, Amador and San Joaquin counties, and within the Arroyo Seco Rancho Grant from the Mexican Government. This grant was confirmed by the Land Commissioners and the Federal Courts. Plaintiff derived his title through a patent issued by the government. The railroad company claim each alternate section along the line of the road, by an Act of Congress. The question was, if the rights of the company are superior to those of the grantee? and the court decided that they are not.

DEEP SNOW.—The *Walla Walla Union* says: "In all directions we hear of very deep snows in the mountains. There has already more snow fallen this winter than in any other preceding one for many years. And thus far there has been no thawing in the mountains, all the snow that has fallen still lying there. Not a week passes but that more is being added. The prospects now are that when the snow on the headwaters of the large streams begin to melt, there will be very high waters soon after. Portland will need to move her cellars back on higher ground before the 10th of June. But the pleasing feature of all this is that there is a better prospect for a good mining season, and a heavier yield of gold than we have had for a long time."

ALL the miners in the employ of the Arizona Association, says the *Winnemucca Register* of February 20th, have been discharged, and the mine shut down. In consequence thereof all the mills in the place are closed except one.

PLASTERS.—Mustard plasters should be mixed with the white of an egg, and they will burn without blistering.

A REPORT is enrent at Coos Bay that the Pacific Mail Steamship Co. is negotiating for the purchase of the Blue Mountain Coal company's mine.

THE SPRING VALLEY Co. at Cherokee Flat, Butte county, has made another clean up and sent down three bricks valued at over \$73,000.

1840. 1874.

PAIN-KILLER, THE GREAT FAMILY MEDICINE OF THE AGE.

TAKEN INTERNALLY, IT CURES

Dysentery, Cholera, Diarrhea,
Cramp and Pain in the Stomach,
Bowel Complaints, Painters' Colic,
Liver Complaint, Dyspepsia, Indigestion,
Sore Throat, Sudden Colds,
Coughs, &c., &c.

Used Externally, it Cures

Boils, Felons, Cuts, Bruises, Burns, Scalds,
Old Sores, Sprains, Toothache, Pain
in the Face, Neuralgia, Rheu-
matism, Frosted Feet,
&c., &c., &c.

PAIN-KILLER,

After a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is that its sales have constantly increased and wholly upon its own merits. The effect of the

Pain-Killer

Upon the patient when taken internally, in case of Cold, Cough, Bowel Complaint, Cholera, Dysentery and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

The Pain-Killer

Derives much of its popularity from the simplicity attending its use, which gives it a peculiar value in a family. The various diseases which may be reached by it, and in their incipient stages eradicated, are among those which are peculiarly fatal if suffered to run; but the curative magic of this preparation at once disarms them of their terrors. In all respects it fulfills the conditions of a popular medicine.

Be sure you call for and get the genuine Pain-Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine.

Price 25 cts., 50 cts., and \$1 per Bottle.

Sold by all Medicine Dealers.

THE SELDEN DIRECT-ACTING STEAM PUMP, A. CARR, Manufacturer & Proprietor.

Patented

Aug. 2d. 1870.

Dec. 20th, 1870.

Combining simplicity and durability to a remarkable degree. Its parts are easy of access, and it is adapted to all purposes for which Steam Pumps are used.

As a Mining "Pump" it is Unsurpassed.

—ALSO—

STEAM, GAS & WATER PIPE, BRASS WORK STEAM & WATER GAUGES, FITTINGS, ETC.

CARR PATENT STEAM RADIATOR.

Send for Price List and Circulars. Address,

A. CARR,

HUNTINGTON'S PATENT SHINGLE MACHINE.

They are now used by all the PRINCIPAL MILLMEN ON THE PACIFIC COAST.

MANUFACTURED AND FOR SALE BY

F. A. HUNTINGTON, 143 and 145 Fremont Street,
SAN FRANCISCO.

Price, Complete, with one Saw, - - - - - \$450.00.

The inventor refers to the following parties who have these machines in use:

Macpherson & Wetherbee.....	San Francisco.	Harrington & Co.....	Pescadero.
Pope & Talbot.....	San Francisco.	Burch & Co.....	Pescadero.
Hanson & Co.....	Redwood City.	A. Saunders.....	Point Arena.
Rice & Halliburton.....	Woodside.	A. H. Davis & Son.....	Carson City, Nev.
	S. P. Pharis, Woodside.		

STEAM ENGINES, SAWMILLS, PLANING, LATH AND PICKET MACHINES, etc., made to order at short notice.

F. A. Huntington's Portable Saw Mill.

The mills are built in the strongest, most durable and workmanlike manner, and are capable of driving any size saw up to 64 inches. They are furnished with improved friction feed and gig back, both being operated by the same lever, no belt being used to gig back.

They are Capable of Cutting from 8,000 to 12,000 feet per Day.

Saw Mill Machinery of all descriptions furnished to order.

GLOBE IRON WORKS,

143 and 145 Fremont street, San Francisco.

WARING ROCK DRILL COMPANY.

the information in their possession. 3v28-16p-3m

STICKEEN MINES.—A party of 300 miners left Fort Wrangel on the 10th inst. on their way to the Stickeen mines. We mentioned in a previous issue that parties going thither should be careful not to overload themselves with provisions, etc., as the overland route is a hard one. The Portland Bulletin, in speaking of the party referred to above, is reliably informed that they found large quantities of provisions scattered along the road, thrown away by overloaded "sledgers." The weather had been cold, but nothing like as severe as they had been led to expect, and it was then raining. Men who had been at the mines and wintered at Fort Wrangel, gave new comers better encouragement than they had received before leaving home. All were in excellent spirits, and had high anticipations for the future, which we hope may be fully realized.

ARE YOU OPEN TO CONVICTION? If so, you cannot doubt, from the testimony laid before the public, that *Hale's Henry of Hockwood and Fur* will cure coughs, colds, and all controllable diseases of the lungs and throat, when all other pulmonals have failed. Crittenton's, No. 7 6th Avenue. Sold by all Druggists. *Pike's Toothache Drops* cure in 1 minute.

PATENTS & INVENTIONS

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Mar. 3d, 1874.

For WEEK ENDING Feb. 17, 1874.

LAMP BURNER.—Welcome Hathaway, Ophir, Cal.

WATER-CLOSET REGULATOR.—John Marquis, S. F., Cal.

TREATING ORES.—Charles H. Aaron, Benton, Cal.

REISSUE.

ENAMELING PHOTOGRAPHS.—Nathaniel Weston, S. F., Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

SAN FRANCISCO METAL MARKET.

WEDNESDAY M., March 4, 1874.

The market for Iron and Steel is depressed, but a better feeling is looked for with the opening of the regular spring trade. Quicksilver is as firm as ever.

Mining and Other Companies.

Due to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening, which is the very latest hour we can receive advertisements.

Buena Vista Petroleum Company—Location

Location of principal place of business, San Francisco, California. Location of works, Kern county, California. Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of January, 1874, an assessment, (No. 22), of one dollar per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 430 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the thirtieth day of March, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By Order of the Directors, L. AGUAYO, Secretary.

Office No. 430 Jackson street, San Francisco, Cal. 17

Enterprise Consolidated Mining Company,

Location of works, West Point, Calaveras county, California. Principal place of business, San Francisco, Cal. Notice is hereby given that a meeting of the Board of Directors of the Enterprise Consolidated Mining Company will be held at the Company's office, 234 Montgomery street, San Francisco, California, on Tuesday, the 11th day of March, 1874, at 3 o'clock P. M. of that day. Said meeting is called for the purpose of adopting a code of By-Laws for the government of said corporation.

P. E. MORRIS, Acting President.

San Francisco, March 5th, 1874. mr7

Geneva Consolidated Silver Mining Company

Principal place of business, City and County of San Francisco, State of California. Location of works, Cherry Creek Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of February, 1874, an assessment of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at his office, room 14, 302 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighteenth day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 18th day of March, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. I. T. MILLIKEN, Secretary.

Office—Room 14, 302 Montgomery street, San Francisco, California. feb14-w

Germania Mining Company—Location

Principal place of business, San Francisco. Location of works, Tintic District, Utah county, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held February 24, 1874, an assessment, (No. 1), of fifty cents per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 408 California street, Room 16, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 14th day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 14th day of April, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors, J. W. TRIPP, Secretary.

Office, 408 California street, Room 16, San Francisco, California. feb7

Hudson Gold Mining Company—Principal

place of business, San Francisco, State of California. Location of works, Cherokee Mining District, Plumas Co., Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of February, 1874, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 113 Leidesdorff street, Room 10, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of April, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., January 14, 1874.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 24, 1871. A. S. HALLIDIE, President Board of Managers. W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, adding gauge; K, valve to shut off when engine stops; H, F, valve to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Made by California Brass Works, 125 First street, S. F. 24v23tf

EAGLE IMPROVED CHLORINIZING AND DESULPHURIZING FURNACE.

BUY BARBER'S BIT BRACZ.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoekin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy on Improved LITTLE GIANT.

JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapid pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference before. Thus it is constantly passing a regular row between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely amalgamated.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.

Of all sizes and in any quantity, furnished on order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.

Quartz Crushing & Ore Sampling
MILLS.

Nos. 413 & 415 Mission st., bet. First & Fremont, S. F.

Ours is the OLDEST, LARGEST and MOST EXTENSIVELY KNOWN establishment of this kind on the Coast.

Our mills are under the direct supervision of one of the most experienced Samplers and Millmen in the country, and we purpose carrying on the business upon a scale commensurate with the wants of the mining public.

We have the best facilities for Crushing, Sampling and Pulverizing all classes of Gold, Silver, Copper and Lead Ores and other minerals.

We also crush and pulverize all kinds of Marble, Fire-Clay, Bricks, Coke, Cement, etc., upon the shortest notice, for which we have special mills.

Reliable information furnished to miners and ore dealers concerning shipments, freights, prices, etc.

Prompt execution of all orders. Faithful attention to business entrusted to us.

Abundant storage room without extra charge.

Mine Ventilating Machine.

In our issue of the 28th ult., we spoke of having seen an improved machine for ventilating mines, the invention of Capt. W. Williams, of this city. The accompanying cut shows a sectional view of this machine, which is quite simple in construction and operation. The moving parts are enclosed in a large upright box, made in different sizes to suit the requirements of particular mines. Within this box a cup-shaped cylinder is placed, swimming in water, and the motion of the piston rod, actuated by steam power, produces a strong current of air at both its upward and downward stroke. By referring to the cut, the operation of the machine will be easily understood.

The dotted lines at the lower part of the cut indicate the water, which is placed in the machine for the purpose of cooling the air before it is forced into the mine. The cup-shaped piston, *B B* is moved up and down through this water by means of the piston rod *C*, and draws in and forces out the air. *D* is the receiving valve, *F* the discharge valve of the upper part of the machine; *d* is the receiving valve, and *f* the discharging valve for the lower part. *H* and *G* are the discharging and receiving pipes, of the upper and lower portions respectively. When the piston is drawn up, the air enters from the surface through the pipe *M*, and valve *d*, into the receiving pipe *G*, and through the passage *E*, into the interior of the machine. On the down-stroke the valve *d* is closed, and the air is forced down on the water, through the passage *E*, and out of the valve *f*, into the mine. At the same down-stroke air is drawn through the pipe *M*, valve *D*, and passage *H*, into the upper part of the machine *A*, and on the piston being raised to draw the air into the lower part of the machine through the valve *d*, it, at the same time forces a current out of the upper portion of the machine through the valve *F*, into the mine. By this means it will be seen that the machine is double acting, taking in and forcing out air at every stroke, whether up or down.

This machine can be placed at any required depth in the mine and at the same time receive its full supply of air from the surface through the pipe, *M*. No grease or oil is used, thus preserving the air in its pure state. There is at all times about six feet of water in the under portion of the machine, and the up-stroke of the cup piston going to the top of the machine, with the water running down on the sides, keeps the inner part of the machine deglued with water, by which means the air is cooled before it is delivered into the mine. Should the supply of air be taken from the surface in the extreme heat of summer it would be cooled below a temperate heat while passing through. The piston fits closely to the sides of the box, so that when it is raised considerable water follows it, and running down the sides cools the air in the upper as well as the lower part. Capt. Williams originally invented the single acting machine, and used it practically with great success in England; his late improvement has doubled its capacity and otherwise perfected it, as the water is used not only for cooling the air but as a packing for the piston. The single machine giving a six-foot stroke, 30 strokes a minute, the size of the model we saw (three feet square, surface) would deliver 2,799,360 cubic inches of air per minute, and by the inventors' improvement the same stroke, double-acting, would force 5,598,720 cubic inches of cool air into the interior of the mine in one minute. Capt. Williams is sure that he can deliver from 7,000 to 8,000 cubic feet of air per minute into any part of a mine with a machine requiring two horse power to run it.

A great advantage in a machine of this class is that it can be constructed by any carpenter and put up at a mine with very little labor or expense. The power required to run it is very small indeed, as compared with other machines in use for ventilating mines. It may be attached to the pump-rod of the mine or run by any other convenient means. The power required is in fact very little as the mechanism is quite simple and there is very little friction. A man with a windlass crank can work it if necessary. Different sizes of this machine are made to suit the requirements of different

mines. A model of this ventilator can be seen in operation at No. 13 Drumm street, in this city, or Capt. Williams, the inventor can be addressed No. 420 Jackson street by those desiring further information concerning it.

New Lard Package.

Mr. John Molloy, provision merchant at No. 54 Clay street in this city has shown us a rather unique package for holding lard, which he is now using in his business. The package is simply the bladder of a hog, cleaned and prepared until it is like so much satin paper. It looks rather

WILLIAMS' MINE VENTILATING MACHINE.

like adding insult to injury to kill a hog for his meat and fat, and then use a part of his internal organization for the purpose of carrying the fat around in; but when we consider the number of hogs slaughtered every year, we can understand what a saving it would be to pork packers and the public if this method of packing lard were adopted. This package does not cost one-third the sum that ordinary wooden or tin packages cost, and being so very much lighter is an advantage to the consumer, on whom all packages are weighed.

The principal reasons to recommend the new package is, as we are informed, that no adulterated lard can be put up in it without at once being perceived, as the prepared bladder is quite transparent. Mr. Molloy informs us that in the Eastern States, what is left of the lard after the oil is pressed out, is largely adulterated with water, over ten per cent of which is often driven in by hydraulic pressure, and put on the market as pure lard, in nice pails or tins. This it would be utterly impossible to do with these packages as the lard is put in in such a manner that it will admit of no water being introduced, and other foreign substances can be seen through the package. These packages can be bought for one cent each in Chicago, St. Louis, or any of the large pork packing cities, and taking into consideration their cheapness, convenience, and saving in weight, will meet with general approval. As the mouth of the bladder is tied up with a string and can easily be opened, the package can be used more than once if necessary.

Speedy Method of Working Quartz.

A portion of the Sierra Nevada mine in the Comstock is to be worked in a way which will strike most quartz miners as rather peculiar. A drain or chute tunnel has been commenced just below the Geiger grade, a little north of the mill. This tunnel is intended to penetrate the rim rock of the hill, and will, at a distance of about eighty feet from the mouth, enter the old upper surface workings, where the hydraulicking was done in 1860, which paid so immensely with only a few inches of water. The Gold Hill News states

The Hale & Norcross Mine.

The past year has not been a profitable one for the stockholders of the Hale & Norcross Mining Co., as the President plainly states in the annual report of the company just published. The hopes expressed at the last annual meeting of this company, as regards finding pay ore on the 1,700-ft. level, have not been realized; and an additional level 200 feet below, making 1,900 feet from the surface, has since been opened, without realizing any benefit therefrom. Indications, however, on this last level, lead to the belief that a body of ore will be developed on the next level below—the sinking for which has been already commenced, and the depth of 2,000 feet will be reached in sixty days, when further prospecting will be carried on at that depth. The President of the company J. C. Flood, calls the attention of stockholders to the very heavy expense incurred in carrying on mining operations 1,900 feet below the surface and refers with confidence to the economical administration of the affairs of the company.

The Superintendent says that during the past year 28,645 tons of ore have been extracted, and 28,966 tons reduced, the principal portion of which was the product of the old upper levels; and there is now in the ore-house 1,689 tons valued at \$57,823. During the year the main incline has been sunk from the 1,700 to the 1,900-foot level. At the last mentioned depth the horizontal drift from the incline has been continued in the vein to the northern boundary of the mine. Three cross-drifts have been driven through the vein from the east to the west wall, at regular intervals. Another drift has been advanced on this level to a distance of 140 feet south from the incline, at which point a cross-cut has also been run from the east to the west wall. In the various openings thus far made at this depth two narrow seams of ore of good quality have been encountered, which, although continuous so far as explored, have not yet developed to a sufficient width to permit of the profitable extraction of the ore therefrom.

The vein on this level is of much greater width on the 1,700-ft. level above; the formation is much softer, and the general appearance of the vein matter is greatly improved. The ore thus far disclosed is of good quality, and is of unbroken continuity. The vein has now well defined east and west walls, and its characteristics are identical with those of the ore producing levels above. The main incline is already sunk 40 feet below the lowest level, and within 50 days from the present date the 2,000-ft. level can be reached. Judging from the indications shown by the latest explorations, this level will be ore producing. Meanwhile the 1,900-ft. level, which is as yet but partially opened, will be thoroughly explored. The shaft, incline, and all of the hoisting and pumping machinery are in good condition.

From the Secretary's report we gain the following information: The receipts from assessments have been \$233,577 and the receipts from bullion \$544,865. On mine account the sum of \$327,675 has been disbursed; for taxes \$4,892; on machinery account, \$1,625; on team account, \$2,266; on general expense account, 42,059; assay office account, \$8,164; on ore account, \$347,599 this latter item being the cost of working 28,966 tons of ore. It cost the company for extracting the ore, \$3.67 per ton; the cost of prospecting was \$219,950.

During the past year the average assay value of the ore was \$27.42 per ton, of which \$9.08 was in gold and \$18.34 in silver. The actual yield, however, was \$18.81, of which \$6.46 was in gold and \$12.35 in silver. In all 68½ per cent was extracted, 71 per cent of the gold and 67 per cent of the silver. The total yield was, therefore, \$544,865, of which \$187,254 was gold and \$357,611 silver. The loss from actual working as compared with assay value was altogether \$249,434 or a total of 31½ per cent. The average loss was \$8.61, of which \$5.99 was in silver and \$2.62 in gold per ton. During the past eight years the total yield of the mine has been \$7,546,655, and the average yield per ton has been \$38.27.

Ten thousand tons of Coos Bay coal were shipped to San Francisco during February.

THE EL DORADO water and deep gravel mining company, intend taking steps in the spring towards saving a larger and more permanent supply of water from the lakes at the head of their system of ditches.

THE large inverted siphon of the Virginia and Gold Hill water company which carries the water across Washoe Valley, and which we described in detail not long since, is proving a grand success.

CORRESPONDENCE.

Mining in Sierra and Plumas Counties. No. 3.

[By our Special Correspondent.]

The mines in Plumas and Sierra have as yet been scarcely developed. The same will in all probability be said of them fifty years hence and will apply as well to all that vast belt of mineral country lying west of the Mississippi river. I will hardly be able to mention all the little mining camps in the county, in these letters, as they would become tiresome to your many readers; still places of so much importance as the following I cannot omit mentioning. At

Washington Hill.

The diggings are drift, but if water could be obtained for hydraulicing it would enhance the value of mining property to a wonderful extent. At Franklin Hill there are without doubt rich mineral deposits, and, with the limited means at their command at present, the miners are doing well; or rather will do well when water takes a start seaward. I wish to remark here, that in speaking of those two methods of mining—hydraulic and drift diggings—I do not desire your readers to misinterpret my meaning and give to the former a decided preference, for such is not the case. Hydraulic diggings are only adapted to placer mining. There is not to-day any drift diggings in the State that can surpass those of Plumas county. At

Winter's Creek

We find another fine hydraulic flat, owned by the Metcalf Brothers of Sawpit Flat. The owners of this claim have a splendid prospect ahead for reaping a rich reward for their labor and industry.

Campbell's Diggings

I am informed are owned by San Francisco capitalists. They will hardly get opened this coming season, but look out, ye owners, when they open up, for if I mistake not you will be astonished at their great mineral wealth. The diggings at Davis Point are not being worked at present. J. H. Thomas of Laporte is the owner of these claims, and intends to open them as soon as he can obtain a sufficient supply of water for hydraulicing.

The Mountaineer company, at Onion valley have their tunnel in some 1,900 feet, and are taking out fine pay dirt. This claim is in the same range as the Buckeye and Monitor, and can be classed among the best drift claims of Plumas county.

Moroville Ridge

Is an entirely new mining camp. But little can, as yet, be said of the diggings in this vicinity; still it is the general supposition that they are not only rich, but extensive. I have nothing further to say of these mines as I will only speak of what I know to be facts; yet I believe this ridge will make in the future a record of prosperity for itself. At

Barnard's Diggings

The Excelsior company, owned by San Francisco capitalists, have got their claims in fine working condition, and will give a good account of themselves this season.

Spanish Flat

Early and company are well prepared for the coming water season. There is not a doubt but that this company will make a big clean up when the water begins to fall next summer.

Secret Diggings

About one mile from Laporte are, I am informed, owned by San Francisco capitalists. T. Early Esq. is Superintendent of the company, and one more qualified to fill the position could not have been selected. The old original channel is supposed to have been worked out in this mine, but there is enough good paying ground left to last the company for years. They will have an abundant supply of water, when the snow commences to melt, to last until September.

Laporte

At one time paid tribute to Sierra, but being considered by the neighboring towns "a corner lot" it received but a small share of public favor in the distribution of public offices in the county. Laporte applied to the Legislature to be set off into Plumas county to fill the same position in that county—that of "a corner lot." It was granted; and Sierra lost her best town outside of the county seat. Laporte in its "palmy days" was one of the liveliest mining towns in the State. Then its streets were thronged with hardy and industrious miners who spent their money freely. Those were what is called now "the flush days of Laporte." But few, if any, towns have suffered as much by fire, and still as fast as the fire king lays it in ashes the persevering energy of its citizens rebuilds it again.

But, like all its sister towns in the mountains, it has sown its wild oats, and has settled down to a steady life. The gaming table is a thing of the past; while the pistol and bowie-knife no longer hold sway. The old landmarks we once knew, are still there; but most of the old familiar faces of by-gone years have departed from our gaze. Prominent among those still remaining are John Conely, President of the Bank of Laporte. I believe he is a resident of your city, although his interests in Laporte, make him seem identical with those still remaining. Thomas Wheeler, Esq., is another of the "old residents," and occupies

the position of cashier, in the Bank of Laporte; is also Welle, Fargo & Co's agent, and Superintendent of the American Hydraulic Mining company, at Morrystown. T. H. Thomas, the life and head center of the town, still remains. You will see by my letters that Mr. Thomas is largely interested in the development of some of our best mining districts. Mrs. O'Rourke still attends to the wants of the traveling public, at the Washington Hotel, (now the Stage House), and it seems like old times, when I gaze upon those old familiar faces. Goslarde can still be seen at his old place in the Lafayette Restaurant; while Harry Buckley attends to the wants of his customers at Buckley's Hotel. There are many other old residents I might mention, but want of space prevents. Laporte is still the center of those mining towns that surround it; and will, at no distant day, become the liveliest mining town in Plumas county.

The Clay-Blank Tunnel

is in about 1,900 feet. They have recently struck some very fine gravel, and soon expect to show up a good record for themselves; and, from present indications, I believe they will.

The Bald Mountain company are in 1,400 feet with their tunnel, and have a fine prospect ahead.

Conely & Gowell are fully prepared for the spring campaign, as soon as they are re-inforced by water for hydraulicing. Their claims are considered among the best in the county. Immediately above Conely & Gowell's, and adjoining their claims, are the hydraulic claims of Garde & Orr. This company is also fully prepared for attacking the mighty banks of earth, with their "giant" pipes, soon as water makes its appearance. These claims are like Conely & Gowell's, very rich in their mineral deposits. I have not time or space to enter into details concerning the great Slate Creek Basin, but will make that the principal subject for my next letter. MAXIMILIAN, Gibsonville, March 6, 1874.

The Laws the Miners Want.

ENRONS PRESS.—Much has been published concerning the proposed changes in the Mining laws; the Ward hill and Sargents's hill have each been thoroughly digested by the various journals of the Pacific slope. While any amount of opposition to certain portions of these bills has been exhibited, yet scarcely anything in their stead has been suggested. The miner, although knowing that the law of 1872 is unfair and not what it ought to be, yet prefers to rest arms on that, rather than run the risk of trying to change it for the better, and since the introduction of Ward's bill he is shown that his fears are well-founded. That

The Government

Would willingly or knowingly do anything to injure the miner, we do not believe; but it is very evident that men may legislate on matters they know too little about. President Grant—who is familiar with the Indian trails of this section, and thereby knows the almost inaccessible places that the miner has penetrated in search of hidden treasure, driving from his lair the grizzly, both intruder and the intruded-upon, nearly famished and equally ready to devour each other—will be the last to permit this; for we cannot believe that the man who successfully measured swords with the brave Lee, would sign a bill, an insult to the miner and deadly to the mining interest of our coast.

What has not the miner suffered? Hunger is a myth in his catalogue of hardships and sufferings. And would a government that has grown fat and reaped its hundreds of millions, directly traceable to the toils of the miner, enter the ring and join against the miner in his battle with almost unendurable hardships and privations and give a thrust below the belt? Heaven forbid that any government, civilized or uncivilized, should commit such an unholy deed. "Let us have peace." Let the government either not meddle with the present mining law, or do something to recuscitate the languishing condition of the

Mining Interests of the Foot-hills.

The mining interests of the foot-hills must be encouraged, or in ten years they will only be known to herds of goats and sheep. To be convinced of this, one only need to hear the ranchers complain that they cannot make this or that crop pay, and that it is cheaper to buy; and this in the face of the fact that the year through we, in the foot-hills, have to pay the San Francisco prices, plus the freight from that city to the foot-hills, which is generally one cent per pound upon the potatoes, onions, beans and bacon, butter and cheese and all we consume. A comparison of the published market reports of the two sections prove this fact. If the miner leaves, as leave he must if wise laws are not passed, where will the rancher find a market for his scanty produce? He, too, will then have to leave. Let us, then, encourage and

Sustain all our Industries,

Legislating against none, but in aid of all. The question of title in the foot-hills has not, as some claim, acted against the interests of the agricultural producers. They have had control and undisturbed possession of generally twice, and often thrice, the 160 acres they were supposed to pay taxes on, and yet the miner has had to depend on San Francisco for his eatables. There are

Provisions which might be Enacted

That would injure no interest, but benefit all. If we are to have a new law, let us have the following provisions:

1st. No one shall be required to apply for a patent until the net proceeds of his mine shall exceed all costs and expenditures by \$500.

2d. Two hundred dollars worth of labor, or a shaft 40 feet in depth on the vein, or a tunnel tapping the vein at a depth of not less than 40 feet from the surface, and secured against caving by timbering or otherwise shall entitle the owner to apply for a patent. In all cases the labor must have been done by the applicant or his grantor.

3d. A claim shall not be subject to re-location or jumpable as long as the number of hundreds of dollars of bona fide labor equals or exceeds the number of years since located; that is \$200 shall hold a claim two years, \$300 three years, \$400 four years, \$500 five years, etc., but in no case shall a claim hold good seven years without labor.

4th. Of the \$100 required to hold a claim one year, \$10 may be used to pay for assays of ore from such claim.

5th. No district laws shall require work upon a claim for specified months after the \$100 for that year has been expended.

6th. Priority of record of location shall have no weight if recorded within ten days after location.

7th. The County Clerk's office shall be the legal recording place of all notices of locations.

What the Miners Think.

These provisions I have shown to many old miners, and every one has heartily endorsed them. In regard to the first provision it is evident that it is a benefit to the Government to have a mine developed, it certainly is bad policy to cripple the ones engaged in doing so, for the party prospecting a mine generally needs more capital than he possesses.

In regard to the second provision, it is plain that a party should not be compelled to expend \$500, as the law now requires, before he can apply for a patent if he chooses.

In regard to the third provision it is wrong for the government to require a party to extend his expenditures through a series of years if he chooses to do the same amount of labor in one year, or less time. For instance, \$300, expended in one season will prospect a mine more than \$100 a year for three years. It may also be much more convenient for a party who lives a long distance from his mine, to do more in a season and thus save him the expense of a yearly trip to the mine.

4th. In regard to the fourth provision, it is palpable that a miner cannot in many cases, know the value of his rock without assay.

In regard to the fifth provision, the argument used to sustain the third provision will apply with greater force.

The sixth provision is generally a part of all mining laws. Ten days gives a party time, however distant from the recorder.

The seventh provision is of the most vital importance. It is well known that the miner has already, in many cases, resorted to the county clerk's office to get his location recorded, and often without the sanction of the district laws.

There are many reasons to prove the Correctness of this Provision.

I will only mention a few of them. The district recorder often follows some business that requires him to be absent from home, and a person may be compelled to make several visits to his place before he can get his location recorded. The county clerk's office is always open. Again, the duly elected recorder may move out of the district, and no one being elected to fill his office, the records are, perhaps, handed over to an irresponsible person. The county clerk gives bonds. Again, hundreds of thousands of dollars may turn upon the record of a location. Then, how all-important it is that these records should not only be in safe hands, but also in a safe place. Yet it is seldom, if ever, a district recorder has a safe and fire-proof building, while on the other hand the county clerk's offices are always provided with a safe, and that is generally kept in a fire-proof building.

The miners are almost universally opposed to the mineral land being put into market without restrictions.

I send you these suggestions, knowing you to be the miner's friend, and if you deem them worthy of a place in your columns, you are welcome to use them.

JULIUS S. LLOYD.

San Andreas, March 3, 1874.

ACCORDING to M. Cailletet, a film of liquid carbonic acid, one twentieth of a millimetre in thickness, will prevent the passage of a current of electricity. This liquid acid will not dissolve common salt, eodic sulphate, or calcic chloride. Potassic carbonate in it forms a bicarbonate which precipitates. Sulphur and phosphorous are insoluble in it. Iodine dissolves to a slight extent. Petroleum and ether dissolve considerable quantities of the liquid acid.

A VERY delicate piece of work was accomplished at the South Wheeling, Ohio, glass works a short time ago. Several scientific gentlemen desired a glass tube for experimenting in acoustics. A tube was blown thirteen feet in length and two and a half inches in diameter, with not even an air bubble to mar its surface. The glass is not thicker than common window glass.

The Taylor Mine.

Last week a rumor was circulated broadcast that a very rich strike had been made at the Taylor mine. A correspondent living in Georgetown immediately went to the mine to ascertain the facts of the case. The correspondent introduced himself to Mr. Burlingham, the superintendent of the mine, and the latter kindly spent a couple of hours in showing the correspondent through the mill and mine. In the first place there had been no rich pocket struck, in fact, no pocket struck at all, nor has any rich strike been made. The case was just this: The character of the rock had been improving for the last two weeks, but in the twenty-four hours before the rumor of the rich strike had been started, the rock had improved wonderfully. On the dump were about one hundred and fifty tons of ore (perhaps more) which had been assorted into first and second-class ore. In the latter pile there was no difficulty in finding shining specks of gold; indeed one or two pieces of rock in this pile would have made very fair specimens. The first-class ore was much better. Mr. Burlingham ventured that out of three pieces of rock taken at random, one of the pieces would show gold. The experiment was tried, and in nearly every case two of the pieces were auriferous. The color of the rock is something like iron-grey and is quite uniform in appearance. There is considerable sulphur found in the rock which the Supt. thinks will pay to reduce. The mine at the time of the visit was 343 feet in depth and was sinking at the rate of a foot and a half to two feet per day. The ledge inclines eight or ten degrees from a perpendicular and is encased on the upper side by a soft "gongee" and on the under side by a hard brittle wall rock. When the shaft was first started, it was started on a pitch which inclined a little too much and consequently the shaft gradually left the ledge, and the latter not being very well defined near the top, it was thought by many that the mine would not pay for working.

Under the management of Mr. Burlingham affairs have improved decidedly. The direction of the shaft was changed until the ledge was found, and at a distance of 343 ft. from the top the ledge is clearly and distinctly defined. At this depth the ledge is from four to four and a-half feet in width. When the newspaper man found himself at the bottom of the mine, he was able to decide in an instant that the specimens shown him at the top were not rich specimens "found on the dump" for that particular occasion, for the ledge down in the mine appeared much better than the ore at the top. There was plenty of gold to be seen sparkling from the sides of the ledge, but there were no "solid walls of gold," as has been asserted by a county paper. The superintendent of the mine complained, and justly too, that the mine had been misrepresented by enthusiastic reporters and correspondents in search of "items," and also by persons inimical to the Taylor. In this article the correspondent has endeavored to give the exact status of the mine. He examined the ledge from top to bottom, and in the 100 and 200-foot levels. The rock is ordinary at the 30-foot level, good at the 200-foot level and very rich at the 343-foot. The rock that has been taken out will yield \$30 per ton at a low estimate. The correspondent does not venture to make any comparison between this mine and the Cederberg, as has been done, for there is no similarity between the two claims, except that both are gold-bearing. The mill is intended for ten stamps, but there are only five at present. One engine of about sixty horse-power does the hoisting, pumping and crushing. No crushing will be done until the 400-foot level is reached. The timbering of the mine is especially commendable.—*Mountain Democrat.*

MINING AT SHOSHONE.—It may be remembered that we spoke of a visit paid some time ago by John Whitehill, a mining gentleman of considerable experience, to Shoshone district, situated some 120 miles in a southerly direction from this place, and his subsequent departure for Salt Lake. Mr. Whitehill passed through on Thursday last on his return to the mines spoken of, his friends having effected a purchase of the property known as the Indian series, and informs us that men, tools and provisions are en route from Salt Lake to the scene of operations. The President of the company, who made the purchase, is George Atwood, formerly interested in this district, and his associates are English gentlemen of means. Being near the direct line of communication to Pioche, Hamilton will be the point where the business of the company will be done. Shoshone District was discovered and located some years ago, at the time Pahranaagat attracted so much attention, and the mineral found there is milling in its character and remarkably high grade. We are promised fuller information concerning this enterprise shortly, which we will lay before our readers.—*White Pine News.*

MINING TOWNS IN SAN JUAN.—The San Juan Prospector says: Three towns have been located in the mining region; one in Baker's park, near the Little Giant mine, and two others in the Animas valley about forty miles distant from that mine. Of the two last one is called Hermosa, (the first named is known as San Juan City), and the other Elbert. A number of improvements have been made at each place.

MECHANICAL PROGRESS.

Single Rail Railways.

The engineer-in-chief to the Ottoman Government, Mr. J. L. Haddan, has addressed a communication to the *Engineer*, describing his proposed system of cheap transportation over difficult countries. The "Pioneer" system is on the same principle as that of the Mont Cenis and Mount Washington railways; obtaining a secure hold upon a central rail by gripping wheels. But in the new invention the usual side rails are dispensed with, and the center rail alone carries the train. The system also differs from the Georgia single-rail railway almost as widely. After describing the very rugged nature of the country where the trial is to be made, and the disadvantages of the ordinary railway appliances, Mr. Haddan says:

Alt such objections have been carefully met in designing the Pioneer, which the author considers peculiarly suitable for Turkey, the colonies, and even the mountainous portions of our own country. The Pioneer, or steam caravan, has its origin in a wooden post-and-rail railway, erected some thirty years since, at Posen. It worked for many years drawn by horses, and later on, by a stationary engine; but locomotive steam traction could not be made use of, owing to the fact that weight was, in those days, necessary for obtaining power in the locomotive, a burden which the wooden fence could not stand. Many engineers have since attempted to overcome this difficulty; but it seems to me that the Fell horizontal grip, where limited adhesive power can be obtained, quite irrespective of the weight of the engine, is the only practical means of overcoming the difficulty. The permanent way of the Pioneer consists of a wall of a minimum height of 2ft. 3in. and 14in. thick, enmounted by a single rail and sleeper, which simply consists of a 1½in. plank, laid on edge in cement, and tipped with thin half-round iron strips. The wall rarely exceeds 2ft. 3in. in height, because the gripping powers of the locomotive allow the gradients to be traced nearly coincident with the natural surface of the ground, that is to say, with its grosser features. Of course, little dips are not gone into, and ravines are made light of and spanned by sandwich arches in masonry, or with a single iron girder of but a few inches in width.

The locomotive and rolling stock are, so to speak, "twin," and mount astride the wall like a man on horseback, or rather like the panniers on a donkey. The carriages are thus double, one-half on either side of the wall, the roof being common to both; there is a space of about 18 in. in width between the two halves, forming as it were, a passage between them, in the upper part of which are situated the single wheels which are to run on the summit of the wall; the lower part of the passage is open from end to end to allow the carriage, when hung on the wall, to hang down to a depth of 2 ft. 3 in. on either side. The locomotive is purposely extended as much as possible and is articulated; water in one section, fuel in another, boilers in another; by which means its weight per meter does not exceed that of the carriages or wagons when laden. The weight per meter run is about 8 cwt. The total length is 24ft. 8 meters, and its power is sufficient to take 100 passengers up an incline of 1 in 10 at a speed of 15 miles an hour. The great economy manifested in the construction of the Pioneer permanent way, is owing to nine major points and divers less important ones:—(1) The load is spread out over as great a length as possible, and concentration of weight is carefully eschewed. (2) The load or weight of the train is evenly distributed throughout. (3) No hanks or cuttings are required, owing to the special powers of the locomotive enabling the train to follow the natural surface of the soil. (4) No transverse leveling of the soil is required, because the train does not run on the ground, but on the top of the wall. (5) The size of the rolling stock is reduced to the minimum, sufficiently large to accommodate passengers almost singly and goods piecemeal, whereby the size and cost of tunnels and under-bridges are reduced to a mere trifle. (6) The light weight of the Pioneer permits rapid travelling even over the roughest ground. (7) The time of construction may be measured by months instead of years, an important economical item where interest on money is so high as in Turkey. (8) When constructed in iron the whole is transportable. (9) The Pioneer, owing to its climbing powers, can follow a cove line more nearly, and can open up hitherto inaccessible positions; and, moreover, can follow up the rivers (in their beds, if necessary), which frequently form the only means of communication in most mountainous countries.

The locomotive is fitted on its underside with two pairs of horizontal wheels covered with leather, which grip the wall on either side with any desired force. Owing to the constant changes of gradient, incidental to following the natural surface of the ground, the intensity of the grip should constantly vary, which is effected by a screw and lever arrangement acted upon by the draw-bar, which attaches the engine to the train. Thus, as the inclines are steep or moderate, so does the pull on the draw-bar vary, and by its action on the horizontal driving-wheels open or close their full embrace, moderating the adhesion or grip precisely in

the proportion that the gravity of the train varies in its ascents and descents. Thus the whole weight of the train is secured for adhesive purposes.

The equilibrium of the locomotive is maintained by the grip of its horizontal wheels. The train is composed, firstly, of a locomotive, then of a caravan of articulated carriages, each articulation being about 7 ft. long, the whole concluding with a brake-van, fitted, like the engine, with four horizontal wheels. The whole mass is attached together by rigid couplings, which, while freely permitting articulation, do not allow of the smallest lateral motion; that is to say, that no single carriage can lose its balance, upheld as it is by its two companions fore and aft; and as the whole train is continuous, the horizontal wheels of the engine at one extremity of the train and those of the brake-van at the other, effectually maintain the equilibrium of the whole train, and prevent all oscillation whatsoever. A train of twenty-four of our basket-carriages, capable of accommodating ninety-six passengers, will measure in length about 50 metres, and will weigh about 20 tons = 8 cwt. per metre run. Each double carriage contains four passengers, two on either side of the wall and facing each other. The seats are composed of slung strips of carpet-like American chairs—the balance of the passengers is consequently always preserved, even on the steepest inclines.

In conclusion, Mr. Haddan claims that the cost of constructing a railway on this plan will be one-tenth of the expense necessary to fit out a common, broad-gauge road, that is, such as are used in England and on the Continent. The gain over our roads, and even narrow-gauge roads, would be, of course, much less, but still very great. Any system which will prove itself effective and yet be materially cheaper than those heretofore planned, will be a great boon to California, where cheap transportation is so pressing a need. We regret that our space is inadequate to a more full resume of Mr. Haddan's interesting paper.

Improved Seeders.

In a new form of seed planter, invented by a Mr. Koeller, of Illinois, the bottom of the seed box is formed with a circular recess in its center, in the sides of which are formed slots to receive the sliding bar, by the movements of which the dropper is operated. To the center of the bottom is attached a projection which passes up through the sliding bar and forms a pivot for a star wheel, which is made with seven rays, the outer ends of which are made more inclined upon one edge than the other, so that the point or extreme end of the arms may lie at one side of the radius passing through the center of the said arms. To the upper side of the sliding bar are attached two wedge-shaped projections, which fit into the space between the rays of the star wheel, and which alternately strike an arm of the wheel and turn it through have the space of one arm. The dropping plate is made in the form of a circle with its middle part cut away, and is carried around by and with the star wheel. In the dropping plate, near its outer edge, are formed fourteen holes, arranged in a circle and at equal distances apart, which receive the seed from the hopper and carry it to the discharge hole through the bottom, through which it falls into the guide spout that conducts it to the ground. Upon the lower side of the sliding bar is formed a projection which works in a slot in the bottom, and to the end of which is pivoted the end of a bar, the other end of which is pivoted to a bar, which is in turn pivoted to the conductor spout so as to detain the corn in the conductor spout. This is operated at each movement of the sliding bar to allow the corn to drop to the ground.

Another new machine, a grain drill, is described as follows: A long grain hopper extends across the front portion of the machine with a chamber into which the grain escapes through the passage, which is regulated by a gate. The side of this chamber is made to fit nearly half around a small dropping roller containing pockets, opposite which there are slots, through which the grain passes into the pockets. The roller has as many pockets as there are to be drills in the machine, and each pocket discharges into a spout for sowing in drills. The drill stocks may be readily released for adjustment or removal. The dropping spouts terminate over the drill tubes, and have, when the machine is to be used for ploughing, a gate or valve closing against the lower end by a spring shank to retain the grain until it should fall into the hill.

NEW SURGICAL DEVICES.—Two great surgical novelties have lately been introduced into European hospital practice. The first is the aspirator, originated by Dr. P. Smith, which has been extensively employed by Dr. Dieulafoy, of Paris. By this instrument fluids can be extracted from formations at some distance from the surface with safety and certainty. The second novelty is the introduction of a bloodless method of amputation and other operations on the limbs, by means of a compressing bandage, by which the limb is blanched by a circular elastic cord, which compresses both the arteries and veins of the limb. This plan, proposed by Professor Esmarch, has been adopted by many hospital surgeons. It remains to be seen whether there are any drawbacks to this system, and especially whether, in certain cases, embolism is likely to result from displacement of clot, which may have already formed in the veins of a damaged limb.—*Scientific American*.

SCIENTIFIC PROGRESS.

Vivisection.

The dissection of living animals for scientific purposes, is at present the subject of warm debate in England. On the one hand it is maintained that vivisection is not justified by any requirement of science, and on the other, that the reasonable hope of the smallest addition to our stock of physiological facts, fully warrants even the most severe torture inflicted upon helpless brutes. Both these views are extreme. "When man's convenience, health, or safety interfere, his rights and claims are paramount, and must extinguish theirs," said the sensitive, sometimes even morbidly sensitive, Cowper. But to what extent "man's rights and claims" may justify him in inflicting pain upon lower animals, is a question not always easy to decide. That many of the most important acquisitions to physiological science, could hardly have been achieved without experiments upon living animals, no one will venture to deny; and that the pain inflicted is, when the end to be attained bears a reasonable proportion to the brute agony inseparable from the investigation, fully justifiable, will be granted by all in whom sentimentalism does not reach the degree of mental weakness. But, while the investigations of a Harvey, a Bichat, or a Brown-Séquard, involving more or less animal misery, ought not to be, and cannot be reasonably condemned, it does not follow that their experiments are to be repeated by every student, or for the edification of every class of students who may find it necessary to be informed of the facts which the leading scientific investigators have brought to light. A renewal of Harvey's experiments, for instance, is not necessary to the understanding of the laws of the circulation of the blood; neither would a promiscuous slashing and mutilating, either with the hope of stumbling upon some new fact, or merely for the purpose of witnessing, at first hand, phenomena already known and described, be anything more or less than diabolical cruelty.

In short, there is no well-defined dividing line between what is allowable and disallowable here, more than in the treatment of animals in their general use by man. The only correct criterion is the motive which actuates the man in his treatment of the animal. If the act, whatever it may be, taken in connection with its attendant circumstances, indicates a pleasure in the infliction of pain, or even an indifference to the suffering of any living thing, it betrays a character which is execrable. But, on the other hand, a hyper-sentimentalism which would place the lower animals nearly on a level with man, and condemn any pain or even discomfort to them, no matter what human interests may be at stake, is an extreme equally to be avoided. The castration of male animals, and to some extent, the spaying of the female, and the cutting off of the tails of lambs—operations of constant and universal occurrence—can hardly be regarded as less painful than most of the vivisections; probably very much more painful than some, have never been very extensively condemned. The only question is, are we enough benefitted by the result to justify the infliction of pain? Stripped of the sanctions of custom, and regarded in its true light, there is more genuine barbarism in the chase of a poor hunted hare; reared for this express purpose, by a pack of hounds and a troop of English hunters, than in all the vivisections that have ever been performed. Let vivisections be performed humanely, that is, only with a view to ascertaining facts not otherwise accessible, and by persons who will seek to deprive them of pain, so far as consistent with the nature of the investigation. Such experiments are not pleasant to contemplate even in imagination; but the knowledge gained by them results in the general amelioration of the condition of both man and beast, and on this account alone are they allowable.—*Artisan*.

COLOR-CHANGING IODIDES.—Some time ago M. Meusel announced the discovery of two new double iodides of mercury, silver, and copper, which were of especial interest in virtue of the property of changing color upon the application of heat. The first of these new compounds is prepared by adding a solution of silver nitrate to one of mercuric iodide in potassium iodide, and is of a bright, lemon yellow color, changing under the influence of heat below 212 deg. to a rich orange, and regaining its original tint when cooled. The second is prepared by adding to a warm solution of mercuric iodide, in potassium iodide—first, copper sulphate, and then sulphurous acid. Its color is carmine, becoming black, however, at a temperature of 158 deg. Fahr., but restored on cooling. When mixed with gum-water and applied to paper, these bodies exhibit their color-changes in a most striking manner. Especially interesting, however, is the fact that Professors Barker and Mayer have suggested and patented the application of the carmine compound to the hearing portions of machinery in motion, which are frequently difficult of access, to determine whether they are heating. An inspection of the paint would determine the fact without the necessity of actual examination.

A New tubular wicked petroleum lamp has been contrived. It consists of ten small circular wicks in place of a large one. They are arranged in a circle and are attached to a frame movable by a single rack.

A New Acoustic Pyrometer.

It will be remembered that, some time ago, we gave an account of an acoustic pyrometer, devised by Professor Mayer, of the Stevens Institute. The principal on which the instrument is based is the variation of the length of a sonorous wave in air, when the temperature of the latter is changed.

M. Chantard states, in *Les Mondes*, that in his opinion the method proposed by Dr. Mayer is difficult in application, and he suggests the following arrangement as more suitable for practical requirements:

The sound is produced by the aid of an organ tube, Ut 4, for example, disposed with reference to a resonator which is put in relation with the two branches of a König improved interference apparatus. To the moveable branch is attached a long tube of copper, which enters the furnace or other locality, the temperature of which it is desired to determine. The tube returns on itself and communicates with a small manometric capsule. The fixed branch of the apparatus is terminated by another capsule, which, like the first, is in relation with the same source of heat. The arrangement is completed by a revolving mirror, in which the state of the flame is seen.

Thus disposed of, if the pipes which separate the resonator from the capsules each contain an equal number of half wave lengths, the flame will be edentulated; in the contrary case the indentations will diminish, and this is as much more as the difference of length of the tubes is more nearly equal to an unequal number of half wave lengths. In the latter event the flame takes in the mirror, the aspect of a ribbon; and by noting the changes in its appearance the calorific state of the air in the tube in the furnace is determined. If the temperature is elevated, the length of wave augments and a clearly defined interference is shown by the flame in the mirror. If, during the continuance of the experiment, the moveable tube be gradually elongated, it will be easy to bring the flame back to its primitive state, that is, to cause the indentations to re-appear. Then, by the aid of a scale previously determined and empirically translated into thermometric degrees, the degree of temperature in the tube can be easily noted.

Effects of Heat on Textile Fabrics.

Recent experiments on disinfection by means of heat, made by Dr. Ransom, of Nottingham, show that white wool, cotton, linen, silk, and paper may be heated to 250° F., for three hours without apparent injury; although the wool will show a faint change in color, especially when new. The same may be said of dyed wools and printed cottons, and most dyed silks; but one kind of white silk easily turns brown by this heat, and pink silks of some kinds are also faded by it. The same temperature will, if continued for a longer period, slightly change the color of white wool, cotton, silk, paper, and unbleached linen, but will not otherwise injure them. A heat of 295° F., continued for about three hours, more decidedly singes white wool, and less so unbleached; and white cotton and white silk, white paper, and linen, heth unbleached and white, but does not materially injure their appearance. The same heat, continued for about five hours, singes and injures the appearance of white wool and cotton, unbleached linen, white silk and paper, some colored fabrics of wool, or mixed wool and silk. It is noteworthy that the singeing of any fabric depends not alone upon the heat used, but also on the time during which it is exposed. In these experiments the heat was obtained by burning gas with smokeless flames, and conducting the products of combustion, mixed with the heated air, by means of a short horizontal flue, into a cubical chamber through an aperture in its floor, and out of it by a smaller aperture in its roof. Fixed thermometers showed the temperature of the entering and outgoing currents, which represented the maximum and minimum temperatures of the chamber. A self-acting mercurial regulator maintained the temperature of the entering current at any required degree.—*Jour. of Applied Science*.

THE HEAT OF THE MOON.—The Earl of Rosse, in a recent lecture before the Royal Institution, gave some interesting information concerning the various experiments heretofore made to detect the heat of the moon, and then described his own efforts in this line, which are the latest that have been made known. By means of a specula-mirror, a thermo-pile, and a pair of reflecting galvanometers, made on Sir William Thompson's plan, such as are used for sending messages through the Atlantic cable, the Earl was enabled to demonstrate the presence of heat from the moon, but the temperature of the lunar surface still remains far from being determined. My calculations, he says, lead me to estimate the heat from the moon as the eighty thousandth part of that from the sun. Bouguer's experiments give the brilliancy of the full moon as the 300,000th part of that of the sun. Wollaston gives it as the 80,172d; Zöllner as from 618,000th to 619,000th; and Bond as the 470,980th. The maximum of the lunar heat appears to be a little before full moon; this unequal distribution of its mountains and plains, perhaps, goes to explain this phenomenon.—*The Engineer*.

A Wisconsin man claims to have invented a machine with which wagon and buggy wheels can be made in fifteen minutes.

MINING EXPEDITION FORBIDDEN.—The Secretary of War has written to the Governor of Montana, saying that the proposed mining expedition from a point in that Territory, alluded to in circulars recently forwarded by General Custer to the War Department, will not be permitted to move. The reason for opposing it is because of the great probability which would attend it of seriously aggravating the Indian troubles now in existence.

Weekly Stock Review.

THURSDAY, March 12th, 1874.

Stocks continue dull and prices low. There has been very little animation in the stock market for several weeks past, notwithstanding that the work of development and ore production goes on as steadily as ever, especially in the Washoe mines. The continued bad weather has prevented the usual quantity of ore being sent to mill in some localities, but generally news from the mines is pretty good. The annual meeting of the Hale and Norcross Co. was held this week, and the report of the officers submitted; it is referred to at length in another column.

The Consolidated Virginia is yielding 200 tons of ore daily, and this amount will be considerably increased as soon as the roads are sufficiently in order to permit the transportation of ore to the mills. On the 3d inst. \$45,646 in bullion was shipped from the mine. A 20-stamp mill will be erected by the Globe Consolidated Mining Co., Washoe, at the mouth of their tunnel, thus enabling them to work with profit the body of low-grade ore developed in the upper portions of the mine. This company is made up of the Arizona and Utah and Globe mining companies, which were consolidated on the 14th of last month.

A set of Burleigh drills is being set up for use in the Gould & Curry mine. The air pipes are being carried down the shaft and everything put in readiness for starting the com-

The water on the 1,500-ft. level of the Crown Point is rapidly diminishing in volume, and it is expected that the level will soon be drained.

The Belcher is looking well throughout, and the mills are running up to their full capacity. F. T. Smith, lately of the Consolidated Virginia, has been appointed superintendent of the Justice mine.

During the week the fluctuations have been about as follows: Alpha has varied between \$11 and \$13 1/4; Belcher between \$80 and \$89; Caledonia, \$28 1/2, and \$31 1/4; California, \$34 1/2, and \$37 1/4; Chollar \$62 and \$66; Cons. Virginia \$67 1/2, and \$69 1/4; Crown Point, \$89 and \$95; Gould & Curry \$18 1/2, and \$20 1/4; Hale and Norcross, \$43 and \$48; Justice, \$8 and \$9 1/4; Ophir, \$22 and \$26; Savage, \$73 and \$86; Seg. Belcher, \$87 and \$91; Union Cons. \$13 1/2, and \$16; Yellow Jacket, \$61 and \$65 1/4; Raymond & Ely, \$26 and \$29; Chariot Hill, \$4 1/2, and \$6; Golden Chariot, \$16 and \$19 1/2; South Chariot \$22 1/2, and \$24; The prominent advances and declines for the week are as follows: Best and Belcher shows a falling off from last week's highest price of \$3 1/4; Chollar, \$5; Exchequer, \$3; Gould & Curry, \$2 1/4; Hale & Norcross, \$13 1/4; Ophir, \$9; Overman, \$10; Savage, \$14; Seg. Belcher, \$4; Yellow Jacket, \$4 1/4; Raymond & Ely, \$4. The advances are few and small. Caledonia shows an advance of \$2; Crown Point, \$1, and Sierra Nevada, \$1.

As we hear nothing more of the late rich strike at Silver City, the presumption is that the mass of rich gold-bearing quartz struck upon was but a pocket, and a small one at

The following Companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

BAY STATE M. Co. — March 9. Location: Amador County, Cal. Capital stock, \$5,000,000. Trustees — Donald McDonald, J. L. Hohart, Wm. H. Dunbar, Wm. T. Henson, A. P. Cox, W. S. Lyle, Charles McGuire.

PACIFIC HYDRO-CARBON Co.—Merch[il]. Object: To carry on the business of distilling coal tar with the patent apparatus of H. H. & C. J. Eamee and to sell the products. Capital stock, \$50,000. Directors—H. H. Eamee, R. D. Walbridge, S. C. Young, William L. Werd and D. N. Henshaw Ward.

EL MADRE QUICKSILVER M. Co.—March 11. Location: Nepe Co., Cal. Capital stock, \$5,000,000. Directors—Adam Grant, E. Greens, A. H. Harrie, R. E. Brewster and A. R. Preston.

IRVING CONE. M. Co. — Merch 11.—Location: Gold Hill, Nev. Capital stock, \$3,000,000. Directors — M. D. Townsend, Thos. Cole, R. L. Tracey, Robert N.

THE FINE MOUNTAIN QUICKSILVER M. Co. filed its certificate of incorporation at the office of the Secretary of State, at Sacramento, on the 16th inst. Location: San Louis Obispo county, Cal. Capital stock, \$1,000,000, in shares of \$500 each.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

Q-15

ALPINE COUNTY.
MOUNTAIN MATTERS. — *From M. & E. J. A. Co.*

MINING MATTERS.—*Miner*, March 7: In the Silver Glance mine the main shaft measured 143½ ft. on March 2d, and the work of sinking is being steadily pushed forward. The rock last up from the bottom presents fine specimens of quartz carrying good-looking sulphurets.

The ponderous and worthless furnace has been removed from the M. & N. W. mill, and other alterations will soon follow.

It is rumored that work will commence on several abandoned claims as soon as the weather will permit.

At Silver mountain the Exchequer mill is working. The continued severity of the weather, with almost constant storms, has prevented much activity.

PHOENIX GOLD MINE.—The new shaft on this mine is now down 700 ft. and levels have

commenced therefrom north and south. The vein in the bottom of the new shaft is from three to four feet thick. The south shaft has also reached 700 feet in depth, with a level driven south 125 ft., and north from the shaft

90 ft., the ledge in the drifts being from 3 to 4 ft. thick. The level north is being driven to connect with the 700-ft. level running south

from the new shaft; the ledge in this level will average over 30 ft. in width, and all the rock in the 700-ft. level will pay \$12 per ton by mill process. Distance from north to south

shaft along the course of the vein, 235 ft. The fine mill connected with the mine is kept steadily employed. The ditch that supplies

the mill with motive power has been greatly improved, rendering the flumes of a permanent character, and far less expensive than the

frame-work plan of supporting them. The ditch now has sufficient capacity to float from the head, or from any intermediate point, all

timbers, lagging or material of that nature, required by either mill or mine. This will be a very great saving in the delivery of all re-

quired timber material at the mine. An immense reservoir has been constructed some distance above the mill, and intended to fur-

distance above the dam, and intended to furnish the ditch when the river supply becomes scarce; this reservoir when filled will cover 160 acres, and a considerable portion of it to the

acres, and a considerable portion of it to the depth of 25 ft., thus affording abundant supply of water for all purposes of mill and mine throughout the driest summers. The Phoenix

throughout the driest summers. The Llaneta mine will always rank as one of the first-class mines of the county.

CALAVERAS COUNTY

Mining Items.—*Chronicle* March 7th: The gulch claim belonging to Mr. S. S. Moser, is

being worked with profit to the owner. An immense quantity of tailings have been "run down," and the bottom of the gulch reached

DURYEA is cleaning ledge. He has run two

tunnels into the high bank, towards Stockton ridge, in which he intends setting off heavy blasts.

EVANS & McCANN have run their tunnel 300 feet through the hardest kind of bedrock and are still driving ahead.

VEITH & Co. had just cleaned up, after a two weeks' run, taking out something over \$1,800. Cook & Co. are still engaged piping surface,

BRACKETT & Co. have not yet struck gravel exactly to suit them and are prospecting for

EL DORADO COUNTY.

RICH STRIKE.—Mountain Democrat, March 5: Another rich strike in the Ida Mitchell mine was made on Saturday last. On discharging a blast, a seam of rock about the thickness of a man's hand was displayed, which was so yellow with the precious metal as to seem, almost solid gold. The extent of this vein, is of course not known, though it may be safe to say, from what is already in view, that startling developments may be looked for when the next crushing is made, which will be in a few days.

ITEMS.—Republican, March 5th: At the "Excelsior" gravel mine, the whole winter has been spent in clearing out debris, building flames, etc., and the mine is now in a splendid condition to work.

The Ledge recently developed in the old "Oregon" is daily becoming better defined, and its richness and permanency are almost absolutely assured already. The owners of the mine would not take less than \$100,000 for it to-day, and there is little doubt that in six months it will be practically demonstrated to be worth double that sum.

Work on the Gross ledge is progressing slowly. There is now out about 80 tons of pay ore, much of which is very rich in sulphurets and free gold. This mine has been sufficiently developed to warrant the erection of a mill.

The shaft of the St. Lawrence mine is down 715 feet, and that of the Taylor mine is down 365 feet.

MENDOCINO COUNTY.

West Coast Star, Mar. 7: The excitement in Anderson Valley, regarding cinnamon mines still continues, and several rich leads are said to have been discovered.

NEVADA COUNTY.

NEW YORK HILL. Tidings, March 7:—This mine, one of the oldest locations in the district, is on the Massachusetts Hill range, and was long held in high estimation here. From 1852 to '67, it is estimated that not less than half a million in gold was taken out, and about as much more since that. Like all our early best paying mines, the New York Hill passed under a cloud some years since; changed ownership and was finally sold out under the hammer. A. Delano, Esq., "Old Block," of this place, became the owner, and like a prudent business man, has been for sometime past carefully feeling his way in the line of opening up the mine, and we are pleased to learn, with bright prospects of seeing it at no distant day assume its place as one of our best paying enterprises. It is already self-sustaining, the ore from the upper tunnel turning out sufficient clear profit to keep the lower tunnel running. This tunnel, now in over 300 ft., must soon from all indications, tap the ledge, when a large amount of "backs" will be at hand and ready to turn out milling rock. Probably no mine in the county is being worked with more economy in all departments than this.

KENTUCKY.—The water in this mine has been too much for the pump during the past few weeks, and very little work has been done. No one conversant with the former results of working ore from the upper levels, or who has seen the fine appearance of the ledge below, doubts the ultimate great value of this mine. The Trustees will meet this evening and consider the future course of operations.

The Magenta mine has over one hundred tons of good ore on the dump and more coming out. The third level is now being sunk and good prospects are shown on all hands.

INABO.—A dividend of ten dollars a share, aggregating \$31,000, was declared by this company on Monday last, payable at the banking house of Findley & Co., in this city.

NEVADA CITY ITEMS.—Transcript, Mar. 5: At Canada Hill, R. G. McEntchin is making from \$15 to \$20 per day to the hand, and Sharp and Kellogg are making \$8 per day to the hand. The gravel lead abounds in coarse gold, pieces weighing \$30 or \$40 each. The lead runs under Canada Hill and has been traced to Banner Hill.

Roberts & Co., owners of the Manzanita claims, have purchased the ravine diggings extending from the lower end of their claims to Deer creek, of B. Locklin. The tailings running over this ground have paid big wages in years past.

The Old Harvey ledge, situated below Nevada City, on Wood's ravine, is again being worked. The ledge has shown in former times rich in free gold. The ledge is about 2½ ft. thick.

Baldwin & Sons are working (by sluice process) their claims near the branch of Wolf creek. These claims have not been worked before in 15 or 20 years. During the past few weeks they have made big wages in working, and considerable coarse gold has been found. There is a good gravel lead in that vicinity, and before many years have elapsed, an immense amount of mining will be done in that locality.

NAPA COUNTY.

QUICKSILVER.—Reporter, March 7: The quicksilver excitement at the Pine Flat mining region continues unabated. There is much excitement in locating and recording claims, and much travel to the district. Many fortunes are (in supposition) being made daily. Some of the claims are being actively worked, and are yielding well.

THE MINES.—The Knoxville mines continue to pour a steady stream of quicksilver from their retorts. The Redington is averaging about 400 flasks per month and the Reed mine about 100 flasks.

SUTTER COUNTY.

OCAL IN THE BUTTES.—Banner, March 7: It was our pleasure to visit the Buttes and pros-

pect the coal indications on Moody's and Krattly's lands in the Buttes, of which mention has been made in this paper. The coal is found in quite a number of the small gulches among the bald hills, lying in thin layers between strata of clay, from one to several inches in thickness, and on a considerable slant. Some of these streaks contain fine specimens of bituminous coal. These indications appear to extend through the hills between the outcrops, as the seams are to be seen on either side. In two or three places an apparent seam of coal was found on the bed of the gulch several feet in width, which, on being opened to a depth of a few feet, were found to be limited in thickness, but extend either way to an unknown distance; however these seams are much decomposed, and mixed with clay. In prospecting one of these in the side of the bank, we came upon a lot of fine, very black, pure coal, which resembled powdered charcoal. It is our opinion that these strata are little arms extending from coal beds lying under the large hills near by. The proper method of prospecting for a coal bed in that locality is to bore for it. Undoubtedly more or less coal underlies the valley along the base of the Nevada from Placer to Tehama.

TRINITY COUNTY.

WEST WEAVER DITCH.—Journal March 7th: During the past week Messrs. Loveridge, Atkins and Paulsen, of this place, returned from San Francisco; Col. A. F. Williams, of Oakland, and Mr. Geo. W. Cox, of Howland Flat, Sierra county, arrived Wednesday evening. These gentlemen are all interested in the West Weaver Ditch and Oregon Gulch Mountain Mine enterprise, and express a determination to enter upon the work at once and forward it with all possible dispatch. Mr. D. W. George the Company's superintendent, is expected to arrive here this (Friday) evening. Work will probably be commenced within the next two weeks, as it is intended to have the ditch completed and the claim in full running order by the first day of May next. Results are expected from this mine which will "astonish the natives," and give to Trinity an enviable reputation as the richest hydraulic mining county in the State. There can be no doubt as to the success of this enterprise.

LEWISTON.—As in all other districts, the miners in and about Lewiston are busily engaged separating the dirt from the gold, and generally find a fair proportion of the latter. Olney Phillips recently made a large clean-up and is said to be well pleased with his claim. Olney says he wouldn't take a thousand dollars for his Little Giant, if he couldn't get another.

GOON WORK.—Louis Lautier, who works in Chapman & Fisher's lower claim, tells us that they have averaged about 1,200 feet of bed-rock per day this season. Although their upper claim is being run on a larger scale the lower one is paying well. Between \$2,000 and \$3,000 was taken out at a recent clean-up.

FIXING UP.—Atkins & Lowden are preparing the Frey mine, on Grass Valley creek, for sluicing, as fast as possible, and before many weeks expect to have it in complete running order. We expect to hear of a big thing from that quarter shortly after they get to work. The gold is there and they intend to find it.

CANON CREEK.—Miners on this stream are hard at work and all reported to be making money. Many of the claims there have heavy gravel and big rocks to contend with; but, as coarse gold is quite liberally distributed among the boulders, the boys don't mind turning a few of them over occasionally. Canon creek is one of the richest mining sections of this county, and it is about time we were hearing of some rich clean-ups in the claims there.

DOING WELL.—Douglas city miners are just now engaged in demonstrating that the mines in their particular locality are not yet worked out. Mr. J. C. Mason informs us that the Union Hill claim last week cleaned up their five head-boxes, after a run of only eight days, and realized \$950. Also that Trotter & Smiley cleaned up \$1,600 from a run of thirteen days in their claim. Other mines in that vicinity are also doing well.

Nevada.**WASHOE DISTRICT.**

SIBERIA NEVADA.—Gold Hill News, March 5: Sinking the new shaft is making steady progress. The ore body in the old upper working is widening out, and bids fair to prove an extensive deposit. The ledge is becoming more solid; in fact, a large proportion of it is now hard blasting quartz.

GOULD & CURRY.—The main east drift on the 1,500-ft. level is still driven ahead, the face in quartz. The main north drift on this level is also making good headway, the face in quartz and low grade ore. The main east drift on the 1,700-ft. level is pressed steadily ahead to reach the east ore vein, the face in porphyry. The main north drift on this level is still following the west ore vein, the face in quartz, giving low assays. For the past two weeks there has been a strong flow of hot water from the face of this drift, but which has almost entirely ceased within the past two days.

HALE & NORROSS.—Four crosscuts have been run between the main incline and the Savage, three of which have penetrated the ledge to the west wall, and the fourth, which is on the north line, to within about 15 feet of the wall, none of which have developed any considerable body of ore. A crosscut has been started 100 ft. south of the incline, to prospect the ledge at that point, which shows a number of cross streaks of ore, but nothing that will pay. Daily yield, 40 tons of ore, from the old

upper workings, which are still as promising as ever.

CROWN POINT.—Daily yield, 450 tons, from the 1,200, 1,300 and 1,400-ft. levels. The north winze on the 1,400-ft. level, has attained a vertical depth of 47 ft., all the way in rich ore. Some high-grade ore has also been encountered in the crosscutting on the same level. Car samples taken from the north winze, day before yesterday, ranged in value all the way from \$90 to \$145 per ton. Are now running south, on the 1,500-ft. level, following along the foot-wall in order to make a connection with the winzes which are being sunk on the 1,400 ft. level.

LARY BRYAN.—This old-established and much misused and abused mine is about being re-opened and worked in a more effective and systematic manner than ever before. A large, new working shaft is to be sunk a short distance east of the old one, and hoisting works of the most effective character, capable of sinking to the depth of 1,800 or 2,000 ft. will be erected. A splendid hoisting engine for this purpose, of 100 horse power, and a huge new boiler, 20 ft. long by 60 inches in diameter, is already shipped to the mine from San Francisco. There is plenty of good pay ore in the mine yet, and the company are going after it.

BEICNER.—Daily yield, 525 tons ore. The ore stops are all looking well and yielding finely. The south winze, on the 1,300-ft., is down 180 ft. In a day or two this winze will have made connection with the main south drift on the 1,400-ft. level, which will give a much needed circulation of good air, and thus greatly facilitate the work in that part of the mine. The north drift from the incline on the 1,100-ft. level, which is following the west wall of the ledge, is in 213 ft.

JUSTICE.—Main incline down 47 ft. below the 400-ft. level. The sinking is good, the machinery works well, and good progress is steadily made toward another level. The Justice mine never has been worked below the 400-ft. level in depth, although it has yielded a large amount of pay ore; but this incline is being sunk for the purpose of deeper, and very possibly, more lucrative explorations.

CONSOLIDATED VIRGINIA.—The main shaft is down 20 feet below the 1,400-ft. level, in good sinking ground. Opening the 1,400-ft. station is making steady headway. The north winze from the 1,300-ft. level is down to within 10 ft. of the 1,400-ft. level, the bottom still in ore. All the ore stops on the 1,300-ft. level are looking and yielding finely, as are also those on the 1,200 ft. level.

DAYTON.—The Woodworth and Devil's Gate mills are kept steadily running on ore from this mine, crushing at the rate of 90 tons per day. Ten tons of the rich ore, which works about \$150 per ton, is also shipped daily to the Auburn mill for reduction. It is expected that the Briggs mill will also be added to the crushing capacity of this mine during the coming week, which will give a total reduction of about 130 tons of ore per day. The mine is looking splendidly throughout.

SAVAGE.—The main west drift, at the 1,900-ft. level, is making steady progress, the face in hard blasting ground. The south drift, on the same level, is making slow progress on account of the intense heat, which is perfectly suffocating to the workmen.

OPHIR.—The main south drift on the 1,700-ft. level is making rapid progress. The bottom of the winze on the 1,465-ft. level is still in ore, though the quality is not so good as at our last report. This poor streak is undoubtedly the same as that cut in cross-cut No. 2, on the 1,300-ft. level, just before reaching the rich west ore body. The bottom of the winze from the 1,300-ft. level shows considerable improvement in the quality of ore. Cross-cut No. 2, on the 1,300-ft. level, also shows great improvement.

OVERMAN.—Sinking the winze from the 1,000 ft. level is making steady progress. The west drift on the 1,200 ft. level is making the usual good progress. The air compressor and other machinery for operating on the lower levels, is now expected daily to arrive at the mine.

TYLER.—The west drift at the first station continues to show excellent prospects of a body of ore. There is considerable flow of water from the face of this drift, but not enough to impede the progress of the work. As soon as the new boilers are ready for use, sinking the main shaft for a new level will be resumed.

YELLOW JACKET.—The main incline is down 125 ft. below the 1,500 ft. level; the sinking is making rapid progress.

GLOBE CONSOLIDATED.—The face of the main west drift at the 400 ft. level, is in quartz of an extremely hard and tough character, making the progress very slow. Every preparation for the extraction of ore from the up-raise from the tunnel level is being rapidly completed.

SILVER HILL.—The body of ore at the second station, north of the shaft, near the Justice winze, continues to improve in both looks and quality as the work progresses.

NEW YORK CONSOLIDATED.—Sinking at the bottom of the shaft is suspended for the present. About 120 ft. of the upper part of the shaft is to be re-timbered, and meanwhile two more boilers and some additional machinery will be procured, so that when sinking is resumed, which will be in about six weeks, much better and more effective work will be done. The prospects at the bottom are of a highly encouraging nature, fully warranting the additional expense and preparation for deeper working.

IMPERIAL EMPIRE.—The ground in the face of the main east drift, at the 1,850 ft. level,

which has been extremely hard, appears to be softening, and shows indications of a near approach to the ledge.

FLORIDA.—In the crosscut north, which is being made at an eligible point in the main tunnel, some very fine prospects are being met with. Ore resembling that of the Ophir is found in spots and streaks, giving good assays.

KEYSTONE.—This mine, adjoining the Justice on the north, is soon to be brought more prominently into notice. The company will, as soon as expedient, commence operations for the systematic development of their mine.

SOUTH COMSTOCK.—The station at the 150-ft. level being opened, and cross-cutting east through the ledge commenced at that point, its width and value will soon be better understood. The drift has already cut into four feet of good milling ore, and the face is still in it. At the surface the ledge is twelve ft. wide, and corresponds in general character with the rock now found 150 ft. below.

LEO.—Main tunnel still following the ore vein into the hill. The ledge is now large and the ore more in bunches. It prospects well. The up-raise above the main tunnel is still in good ore, which is being stoped out and piled on the dump for milling.

UTAH.—The ground in the face of the west drift, at the first station, is quite soft, with a steady though slow decrease in the flow of water. The body of water in the old shaft has been lowered a distance of 224 ft., and is still gradually subsiding.

CHOLLAR-POTOSI.—The daily yield has been increased to 90 tons per day, the assay value of which is \$29 per ton.

ALHAMBRA.—As rapid progress is being made in the erection of the new works and other surface work as the extremely rough state of the weather will permit. As soon as the roads will permit, the new hoisting machinery recently purchased from the Suro Tunnel company, will be moved on the ground and erected.

BALTIMORE CONSOLIDATED.—Sinking the main shaft has been again resumed, the pumping machinery is all in fine working condition down to the 600 ft. station.

SURO.—Still driving the north drift from the main west tunnel, which is now in a distance of 160 ft., the face in very favorable looking quartz. The flow of water is rapidly decreasing. Sinking for the purpose of opening a new level will be commenced as soon as decrease of the water will permit.

KNICKERBOCKER.—The water tanks at the different stations have all been repaired and everything put in good working condition to the 550-ft. level. The snmp is now being cleaned out, and sinking will be resumed in two or three days. The new hoisting and pumping machinery works to perfection.

BUCKEYE.—The main east drift, at the 450-ft. station, cut the ledge during the week, at the distance of 20 ft. from the shaft, developing a large body of white quartz very much resembling the barren quartz of the Comstock ledge. This body of quartz so far as yet developed will not pay for reduction.

LARY WASHINGTON.—Considerable water to contend with, but good progress continues to be made.

SUCCESS.—The little shaft in the Cañon is now completed to the depth of 300 ft., and yesterday and to-day the work of opening a station at that point has been engaged in for a drift to the ledge. The sinking of the new shaft the other side of the hill is progressing as usual, without material change.

JULIA.—The ore body developed at the 1,000-ft. level continues to show improvement in both quantity and quality.

NEVADA.—Running the south drift is resumed, the face showing 2 ft. of the ore vein, which will be followed to ascertain its extent and value in that direction. The cross-cut east is in twelve feet in good ore all the way and no sign of east wall as yet.

CHAPIN AND EAST COMSTOCK.—The machinery of the new hoisting works has been started into operation. The work of clearing the shaft of water is commenced to-day.

EUROPA.—Main west tunnel has cut through over 120 ft. of vein matter without reaching the west wall. The ore in the face of the tunnel still gives encouraging assays.

ALPHA.—The main north drift on the 1,500-ft. level from the Imperial shaft is still driven ahead, following the streak of ore found, which remains unchanged in both appearance and quality.

DANEY.—New shaft to-day down to the depth of 335 feet. The rock is hard and blasts well, and there is little or no water to interfere with the good progress made.

SEGREGATED ROCK ISLAND.—Cross-cutting the ledge will soon be commenced.

MONTEZUMA.—The streak of ore developed in the bottom of the shaft appears to be widening out as the sinking progresses.

MINT.—The frame of the new hoisting works building is up, and the erection of the machinery making steady progress.

WOONVILLE.—Sinking the main incline is making rapid speed.

FATMOUNT.—The north-east drift from the main tunnel is still driven ahead, the face in low grade ore.

CROWN POINT EXTENSION.—The shaft is being cleaned out preparatory to resuming work at the bottom.

KOSUTH.—The main west drift at the 220-ft. level is still advancing in low grade ore.

ROCK ISLAND.—Sinking the new shaft is making steady and favorable progress.

MONOC CHIEF.—New tunnel in 39 feet, and good progress continues to be made.

Bingham Canon Mines.

A correspondent of the Salt Lake Tribune writes as follows from Bingham Canon: All honor and praise to the resident patriots of this camp, for their persistent faith in the ultimate successful development of the immense bodies of wealth which lie entombed on every side; hidden from only those whose general cussedness forbids the encompassing of any knowledge beneficial to mankind.

First Discovery of the Mines.

Eleven years ago this winter a band of sturdy miners, contending against almost insurmountable difficulties, entered this canon, and amidst a blinding snow storm planted their stakes and camped. It was indeed a dreary and most uninviting place.

On the 17th day of the following September, they organized the West Mountain mining district, and elected Archibald Gardner recorder, and on the afternoon of the same day recorded the first mining claim, known as the Jordan. For years they have patiently and diligently toiled on, in developing their garden of Eden, notwithstanding the contemptuous sneers of mining experts and "knowing ones." To-day the result of their energy and belief is being realized beyond all expectations; and

West Mountain Mining District Boasts of 3,207 Locations

Of mining property, owned by persons hailing from every portion of the known world; a population of some two thousand souls, six settlements, called respectively Bingham City, Winnemuckville, Montreal Town, Shanghai, Waggonville and the village of Black Jack; two smelters, separating works, a twenty-stamp mill in the course of erection, a large commercial trade, a railroad which weekly handles millions of pounds of freight, and mines containing larger hoards of ore than any camp in the Territory. This district is

Traversed by three Distinct Belts of Mineral, namely: The Winnemuck or carbonate belt, the Jordan or chloride belt and the Black Jack or sulphuret belt, covering an area three miles in width, and are readily defined by bold iron croppings four miles in length.

Profitable Gold Diggings Abound.

Some \$200,000 has already been cleaned up, and it is expected that \$20,000 more of dust will be washed this season. This class of mining should receive more attention than it has of late. The amount of coined gold being only about four thousand millions of dollars, which if welded into one mass, could be contained in a cube of 23 feet, a sum insufficient to meet the demands of commerce. Aside from the natural advantages incidental to close proximity, and railroad communication with business centers, Bingham is gifted with one of the loveliest and most desirable of climates, affording not only a chance for the impecunious miner to carry on his prospecting at a comparatively small cost, but presents a field of great variety for students of geology, the naturalist and the tourist.

New Discoveries.

Daily new discoveries are reported, and as depth is attained, the ore becomes vastly superior, both in quality and quantity. In the

Owyhee Mine,

In upper Bingham, at the depth of sixty feet a ledge has been encountered three feet six inches wide, with 30 per cent. lead and \$144 silver.

The American Girl,

In Carr Fork, last evening, struck a large body of galena ore, assaying 200 ounces silver.

The Burning Moscow,

In Log Fork, lately purchased by Hay & Co., for \$13,000, at a distance of one hundred and fifty feet, found ore of sufficient value and bulk to warrant them asking \$100,000 for their property.

The Last Resort Mine,

Lately purchased by a Chicago company, have commenced work in earnest, and from the amount of ore in sight, their shipments will be necessarily large. It is the intention of this company at an early day to erect a smelter and refining works.

The Southern Cross,

Owned by John Campbell and Chris. Maltesta, gives promise of being one of the most valuable in the district. They have only run a tunnel of sixty feet, and struck a vein of carbonates, rich both in lead and silver.

The Kempton Mine

Have again resumed work, and are shipping about twenty tons of ore daily.

The Neptune, Sultan, Nez Perces Chief, and Damphool mines, still continue to yield a large amount of wealth. The Jordan is shipping about 690 tons of ore weekly.

The Winnamuck Furnaces

Are again in full blast. Their mammoth dust chambers are working like a charm.

Big Enterprise.

Messrs. Carson & Buzzo have just perfected arrangements to build seven furnaces at West Jordan, on a new and improved plan, part of which are inventions of Mr. Carson.

The Utah Mine.

It is currently reported that the Utah mine,

owned by the Utah Silver mining company (limited), has struck a body of splendid ore, almost entirely free from iron, having passed the immense belt of pyrites, which has heretofore been considerable of a drawback to the company. Their separating works, completed a short time since, at a cost of about \$30,000, will commence running as soon as the weather will permit, and, if successful, will be one of the grandest and most useful monuments of enterprise and economy that have ever been built on the Western coast. The concentrating works are contained in two huge frame structures, and consist of a Blake stone-breaker, Cornish rollers, six continuous self-feeding and self-discharging jiggers, crushers, handles, sizing apparatus, water-washing trenches and furnaces. It is expected that 175 tons of ore can be run through daily, producing 41 tons of concentrated ore, of 75 to 80 per cent. lead and 20 to 25 ounces of silver.

The Agnes Mine.

Which has been leased by Messrs. Walton, Eldredge, Pascoe and Ray, has "struck it rich." At the end of the present incline, a distance of 165 feet, a ledge of carbonate ore has been discovered, varying from 30 to 37 inches in width, assaying from 40 to 125 ounces silver, and from 45 to 65 per cent. lead. The walls are six feet three inches apart, consisting respectively of solid blue limestone and quartzite. The rich ore appearing in three distinct strata—one on the hanging-wall, in the center, and one on the foot-wall.

The Spanish, Last Chance and Montreal mines, are to a certain extent shut down for the present, in order to get breathing time for active operations in the spring.

Idaho Mines.

The Owyhee Avalanche of the 28th ult. contains the following mining items: The mining situation in this camp is decidedly healthy. Aside from the mines that are now being worked, new and important enterprises are on foot for the coming spring. It is currently reported that the Oro Fino has been sold to San Francisco capitalists, who will prospect, explore and develop the property next season. We have always regarded the Oro Fino as one of the very best mines in camp, and rejoice at the news of its getting into the hands of parties who will work it. The Poorman will also be extensively worked next season, and we expect to hear of its regaining at least a portion of its former prestige. Frank Britten and R. E. Beggs are engaged in saving the tailings from the various quartz mills, and intend to have machinery on the ground to work them early in the spring. This tailing enterprise, if properly managed, cannot fail to enrich its enterprising proprietors and increase the wealth and business of our camp. Those who own stock in our mines do not care to part with it, being willing to wait for the enhanced values and dividends that next summer will surely bring. Everybody feels encouraged and full of hope. It is undoubtedly certain that Owyhee is rapidly advancing towards a new era of prosperity.

SOUTH CHARIOT.—This mine is opening out splendidly. The main shaft is down 25 feet below the 8th level. A drift has been started off from the 8th level station north, and is now in 10 feet.

EMPIRE.—The 1st, 2d, 3d and 4th levels are all being driven north through good ore, and the main shaft is down 90 feet to the 5th level, in which they confidently expect to find the rich body of ore that now shows so prominently in all the other levels. The Superintendent says that he will have the Empire well opened for taking out ore by the 1st of June, when crushing will be commenced, and expects that monthly dividends will be declared from that time for an unlimited number of months.

INA ELLMORE.—Superintendent Minear informs us that he has been dived in sinking the shaft during the past few days, on account of the increase of water, but that he is now putting in a tank which will take up the water, thereby enabling him to sink much more rapidly than heretofore. Preparations are being made to start a winze from the 10th to connect with the 11th level, in order to secure good ventilation for the latter level. The mill is being thoroughly overhauled and put in order for crushing.

WAR EAGLE.—This mine continues looking first-rate in all its drifts. They commenced sinking the main shaft for the 7th level yesterday.

THE GOLDEN CHARIOT-MINNESOTA still keeps up its reputation for the richness and extent of its mineral deposits. Red Jacket is about the same as last reported, and gives promise of a big future. The Mahogany main shaft is down 40 feet for the 9th level, with no particular change to note. The Silver Cord is being energetically explored, with the most flattering prospects. Illinois Central is yielding plenty of ore as rich as ever. The Idlewild boys are taking out ore for another crushing. The Belle Peck is yielding richer ore than we have seen for many a day, and will soon have a clean-up that will astonish the natives.

BULLION SHIPMENT.—Wells, Fargo & Co. shipped from here during the past week, bullion to the amount of \$11,231 98.

Four men left Pioche, Nev., on the 25th ult., with a light spring wagon, for San Juan, Utah, via Prescott, Arizona. This is a very round-about way; but by this route teamsters avoid the great snow-belt which has of late caused so much suffering.]

Mining at Belmont.

The Belmont Courier, a new and sprightly journal, which sensibly pays more attention to local topics than to irrelevant subjects, gives the following about the mines in its vicinity.

At no time since the discovery of a silver-bearing quartz ledge in the Pennsylvania (Belmont) mining district, has the prospect for permanency and a large yield of the precious metals, been so good as at the present time, so we are informed by those who have been here since the organization of the district, and who are known to be thoroughly practical miners, and understand of what they are talking about. After a careful examination of a number of undeveloped mines, and favorable locations of those undeveloped, we are forced to the same conclusion. The dark days of Belmont are over. It is no longer an uncertainty as to whether there are mines, or not. "The hearing ear and the seeing eye"—bearing the sound of the pick and seeing the ledges, determines the question with us. Before our advent into the district, we "heard" of its wealth, and with our "eyes" we have seen the mines. Take the Belmont property, for instance—with a ledge of over 6,000 feet in length, of an average width of seven feet, yielding from one hundred into the thousands, per ton. In six months from this time, the mine will be opened from one end of the company's ground to the other, with hoisting works at the two extremes, over perpendicular shafts, which will place the mine in a condition to work a large force of men to good advantage. A silver mine, as well defined as are the Belmont Co's ledges, don't often "net" out. And in addition to the Belmont property, we have the Monitor Belmont and El Dorado South—and others—but of the latter two incorporations named, both have taken out of their ground immensely rich ores, and in considerable quantities. If either of our mines, that are now opened, were near the Comstock, the stock of either one would be worth \$75. For the Belmont mine, we can truthfully say, that if the stock was worth \$32 two months or so ago, it is now worth \$75, there having been a drift run of sufficient length in virgin ground, through the Moore & Martin location, in rich ore, to substantiate our assertion. The large and regular shipments of bullion from the Belmont is entirely satisfactory to stockholders here.

There is now hardly a doubt but what the several incorporations who have developed mines, will, once the weather becomes settled, put on an increased force of miners, and, by the employment of muscle and the necessary outlay of capital, place the mines in this district in a condition that will not only greatly benefit their owners, and the county and State, but enrich the commonwealth at large.

NEW METHOD OF ENGRAVING.—At the recent meeting of the French Association for the Advancement of Science, M. Gourdon, of Lyon, described some novel facts which he had observed in the action of acids upon zinc covered with certain metals. Zinc plunged into dilute solutions of sulphuric, hydrochloric, and acetic acids is attacked only at the points where other metals are present. The metals which produce this phenomenon with most intensity are cobalt, platinum, nickel, and iron. Ammoniacal chloride of cobalt renders it possible to perforate zinc with water containing only one 10,000th part of sulphuric acid. M. Gourdon applies these results to various procedures for engraving. By writing directly upon zinc with different metallic inks, making use of the most active, containing salts of cobalt, for the blackest parts, and passing it then into acidulated water, an engraved plate is obtained. To reproduce leaves or plants, they are soaked in solutions of metallic salts, and applied to the zinc, which is then treated with weak acid. The author has discovered a new kind of heliographic engraving by transferring the silver from an ordinary photographic proof upon the zinc, which can be attacked by the acids in the parts where the silver has been deposited.

RICH QUARTZ.—Mr. Dunlap, the discoverer of the "Morning Glory" quartz ledge, on Granite creek, has shown us some of the ore taken out of the ledge at sixteen feet from the surface. He also showed us the returns of the assays, both at Boise City and this place. We forget the exact figures, but the returns showed about \$250 per ton. Work has been suspended on the mine for the time being, because they had no sufficient means to keep the water out. The hands came to town during the week, and said they had succeeded in sinking a shaft sixteen feet; at that depth the mine looked very promising. Pumps will be fitted up here, and by the opening of spring they expect to drive things along more rapidly. The proprietors think they have got a fortune in the "Morning Glory," and this belief would seem to be pretty well founded.—Walla Walla Union.

MINING ACTIVITY.—A great amount of activity is noticeable in, and about the ore producing mines of the Comstock. Besides the 1,000 tons shipped daily to mills by rail, large quantities are sent off by teams, which from early in the morning line our principal thoroughfares for mining, an almost continuous procession extending from Gold Hill proper to Silver City. Every morning a large number of teams may be seen filing out of the corrals on the Divide, and wending their way northward to the mills in Six and Seven Mile Cañon, the long procession reminding one of an army train.—Gold Hill News.

Protection to Stockholders.

The last Bill of interest to miners, introduced in the Legislature is one by O'Connor, which is as follows:

Sec. 1. "The Secretary of every corporation for the purpose of carrying on the business of mining shall keep the books of such corporation written up every day, and at the end of each month shall make out a balance sheet, showing the correct financial condition of the corporation. It shall also be his duty to make out a written statement, on the first Monday in January, April, July and October of each year, exhibiting all the business and financial transactions of the corporation for the three months preceding, which said exhibit shall also contain a full description of all the property of the corporation, and the character, extent, and the title thereon, which said report or exhibit shall be verified by the oath of the Secretary, and shall, together with all the books, papers and records of the corporation, be open to the inspection of any and all stockholders of the corporation during the hours of business, every day in the year, Sundays and legal holidays excepted.

Sec. 2. Any owner of stock in any of the corporations, mentioned in Section one of this Act, shall at all hours of business or labor, on or about the premises, or property of such corporation, have the right to enter upon such property and examine the same, either on the surface or under ground, and it is hereby made the duty of any and all officers, managers, agents, superintendents, or persons in charge, to allow any stockholder to enter upon and examine any of the property of such corporation at any time during the hours of business or labor, and the presentation of a certificate of stock in the corporation shall be prima facie evidence of ownership, and the right to enter upon or into and make examination of the property of the corporation.

Under Section 3, the violations of the provisions of the Act shall subject the Trustees of the corporation to a fine of \$200 and costs of suit, and the expenses of the stockholders so refused in traveling to and from the property, which may be recovered in a Court of competent jurisdiction, either in the county where the property is situate, or in the county where the office and principal place of business of the corporation is situate, which said fine shall be imposed and collected for and paid over to the person so refused, together with all moneys collected for the said traveling expenses. Referred to Committee on Mines and Mining.

MINING SUIT.—Suit has been commenced by Joseph Trench in the Third District Court against Thomas Sunderland, of Virginia City, to recover the moderate sum of \$726,000. The complaint alleges substantially that Trench owned, in 1866, of the Kentuck mining stock, 666 shares, the whole number of shares at that time being 2,000. Sunderland, who is an attorney, was President of the company, and it is alleged that he fraudulently induced Trench to sell his stock to one John B. Winters, representing that the title of the company to the mine was extremely doubtful. Upon this representation he sold for \$24,000. He alleges that the purchase was made for Sunderland, who realized \$126,000 from the shares so purchased, for which he demands judgment. In his answer, Sunderland denies the charge of fraud, denies that he gave his opinion as an attorney, asserts that there were serious claims against the company's title, and sets up the statute of limitation.

PANAMINT.—A correspondent of the Inyo Independent says: Mr. Barnard McKean, a miner and prospector of no little fame, has returned from Panamint, where he has been putting in the blint end of the winter. He gives a glowing account of the richness of the mines on the surface, and the facilities for working them are unsurpassed. Mr. A. B. Williams, one of the original locators, and at present the sole owner of the Diana mine, left a few days ago for San Francisco to purchase a five-stamp quartz mill, to be put up here somewhere in the suburbs of Benton. A few days ago, two gentlemen from near Belmont, Nev., passed through here for San Francisco on their way for the Sticken river excitement.

A HEAVY SHIPMENT.—The largest shipment of ore ever made over the Virginia and Truckee Railroad since its construction was made yesterday. There were weighed at the American Flat ore scales during the day and evening 146 car-loads of ore. Each car containing about seven and one-half tons, or 15,000 pounds of ore, and the day's shipment aggregated about 2,190,000 pounds.—Virginia Chronicle, March 5th.

MINERAL KING WAGON ROAD.—The Visalia and Inyo Road company have completed their wagon road from Visalia to within fifteen miles of the new mines of the Mineral King District, and a good trail connects with the mines. Work is being vigorously pushed on the road, and it will probably be opened for travel by July. With the opening of spring several strong companies are preparing to mine on a large scale, as many valuable leads have been discovered in the district.

A PATENT has been issued to the Keystone mine, adjoining the Justice, on the Comstock lode.

THE OROVILLE mines still give employment to thousands of Chinamen.

USEFUL INFORMATION.

Separation of Gold and Silver from Lead.

But little is known, to those not engaged in the business, of the methods employed in this country for separating gold and silver from impure lead; and we believe the following facts, gathered by our reporters, will be found of interest:

Two grades of impure lead are exported from Utah to the Eastern States for refining. The impurities are gold and silver, which communicate a superior hardness to the lead, and also increase its fusibility. These ingredients, however, do not exist in sufficient proportion to warrant the application of the cupel process, or rather the loss of lead would be so great as to make the operation too expensive. The lowest grade contains 80 ounces of silver and 1 of gold to the ton; the other grade, known as the B. O. M. bullion, contains 120 ounces of silver and 4 of gold per ton of bullion. Beside these components, certain proportions of antimony and occasionally a trace of arsenic enter into the composition of the bullion.

The bullion is first placed in kettles and melted to refine it. In this process the dross, which rises to the surface of the metal during the melting, contains the greater part of the impurities, such as antimony, bismuth, etc. This dross is afterward refined separately in an appropriate furnace. This having been removed, the melted metal is drawn off into a larger kettle. It is thence removed to other kettles, and a certain proportion of zinc added, the quantity bearing a fixed ratio to the quantity of silver already in the metal. In the working of each sample of bullion a preliminary assay is necessary to determine the proportion of silver.

When the metal is melted with the zinc, a slow fire is employed; and, as the process goes on, an alloy of silver and zinc rises to the surface. The latter is skimmed off, and placed in a plumbago crucible, provided with a neck similar to a retort. The crucible is then placed in one of Du Faur's furnaces, which is so arranged that it can be tilted by the aid of a wheel attached to the furnace. The zinc is here distilled off, and condenses in the tube or neck, which is attached to the crucible. A part of the zinc is driven off as oxide, and this is lost, but about two-thirds of it sublimes in the neck of the crucible. When the tube is removed, the zinc is withdrawn therefrom, and used again in a similar operation. It will be remembered that silver melts at about the same temperature at which zinc is volatilized.

The metal remaining in the crucible consists of gold, silver, and lead, the latter in small quantity. This having been withdrawn, the precious metals are separated from the lead by cupellation. The resulting gold and silver are then run into ingots, and the silver removed by nitric acid, or by whatever method may be most convenient. In this mixture of gold and silver, gold forms from one-half to one and a half per cent. Some idea of the magnitude of the operation may be formed from the following facts regarding a large establishment. They claim a weekly production of silver of about 12,000 ounces, and a proportionate quantity of lead. Generally, the process returns about 89 per cent. of the lead which was in the bullion, at the commencement of the operation. They use cast iron kettles in the process of separating the silver from the lead by the aid of zinc, each capable of holding two tons of bullion. Twelve of Du Faur's tilting furnaces are used, each cupola holding about 250 pounds of metal. Four refining furnaces are used, two capable of a charge of 6 tons each, one of 12 tons, and one of 16 tons.—*Iron Age*.

The manner in which liqueur bon-bons are made is extremely simple. The sugar preparation, reduced to a fine powder, is spread over a tray, and upon this single drops of the liqueur are allowed to fall; the tray is then shaken, and the pulverized sugar forms a coating round the several drops of fluid, which can be increased at will to any thickness. The manufacture of bon-bons is carried on all over France, and in Paris alone there are nearly 200 shops devoted to it, employing over a thousand hands. The men get from a franc and a half to eight francs a day, and the women from one to four francs; while the amount of indirect industry, such as making boxes, packets, crackers, and fancy goods, is enormous. The last published statistics show that the sweetmeat trade of France exceeds twelve million francs. Perhaps the greatest marvel is to find that the country itself expends ten millions of this sum.—*The Engineer*.

WHY ALCOHOL CURES RATTLE-SNAKE BITES.—The experiments of Professor Binz, of Bonn, in regard to the effects of alcohol on animals, are exceedingly interesting, in as much as he seems to have discovered the reasons why alcoholic stimulants were so useful in cases of snake poisoning. He found that when decomposed blood was introduced into the veins of the living animal, all the symptoms of putrid fever were shown, the temperature increasing until death ensued. Alcohol reduced the heat, retarded the putrid process, increasing the action of the heart. This seems to be precisely the effect of alcoholic stimulants, when administered in case of rattlesnake poisoning.

Carbolic Acid.

Carbolic acid, in some of the various forms in which it is offered to the public, is one of the most popular disinfectants, and deservedly so. For simple disinfection, where the cause has been removed, nothing is superior to the acid itself, either concentrated or in solution. It is extremely useful in sick rooms and similar places for cleansing the vessels which have been used, and a small quantity of it added to the water in which the clothes are washed, will effectually destroy all germs of disease which may be present. For disinfecting the air of a sick room a few drops may be put upon a hot shovel or stove-lid, or any article that will retain its heat for some time. It has the advantage that it does not injure clothing or metal articles with which the vapor comes in contact. It should be used with care, however, as the liquid itself is a violent poison, even in small doses.

In many cases, however, something more convenient of manipulation is wanted than the liquid. This is furnished by several different compounds. The so-called "metropolitan disinfectant" is a mixture of sesquioxide of iron and carbolic acid. The iron destroys the organic matter with which it comes in contact, and the carbolic acid is slowly given off and acts in purifying the air. Another compound is the "Egyptian powder," which contains common clay as a basis. Still another, and one which has proved of great use, is carbolate of lime. Carbolic acid has the property of combining with alkalies and alkaline earths without having its active qualities destroyed, as these compounds are very unstable, and are decomposed by the weakest acids. The carbolate of lime is a dry powder, with generally a rose tinge, and smells somewhat like ordinary coal-tar. The lime in it acts upon, and soon destroys any organic matter with which it may come in contact, the carbolic acid being set free. It is extremely convenient and useful in all places where decaying matter is found. A little of it scattered two or three times a week around a swill-pail or other offensive object, keeps it perfectly sweet, and will also drive away all the flies from the vicinity.—*Journal of Chemistry*.

ALCOHOL FROM SAWDUST.—The cheapest material of which to make brandy, whisky, and alcohol is at present sawdust. We mentioned before that sugar is now made of it, and a direct consequence of this is that this sugar, by proper fermentation and distillation, can be made into alcohol, and this again by rectification and flavoring, into any of the mixtures known as gin, whisky, rum, arrack, cognac, brandy, etc. This manufacture of alcohol from sawdust is now carried on in Sweden very economically and on an extensive scale. We rejoice, because if the great staples, such as corn, wheat, rye, barley, etc., are used for this purpose, there is a destruction of material valuable for food; a breaking down of more complex valuable organic compounds into simpler ones, and if these same simpler compounds can so well be obtained from sawdust, which neither animal nor man can eat, there is a great saving in valuable material. The only objection thus far, is that in this operation a portion of the product is not the ordinary ethylic alcohol, but methylic alcohol, or wood spirits, which is less palatable and more unwholesome than ordinary alcohol; but that there is no doubt that improvements in this respect will soon be made, if this is not already the case, and that, as people must have alcohol, it will in the future not be produced at the cost of the destruction of a great portion of the staples of food otherwise adapted for the nourishment of millions, and which now are continually being destroyed by the distillers over all the world.—*Manufacturer and Builder*.

TO INCREASE THE ADHESIVENESS OF GUM ARABIC.—Concentrated solutions of gum arabic as a mucilage, says Hager, possess the disagreeable property, when spread upon printing or other paper not strongly sized, to penetrate them to transparency, and in spite of this not making them adhere to other paper. Paper cannot be attached to common pasteboard, nor wood to wood. Paper pasted with mucilage on metallic surfaces usually falls off soon. The use of gum as cement for glass, porcelain, or earthenware, etc., is entirely impossible. All these disadvantages of mucilage are remedied, when an aqueous solution of sulphate of aluminum is added. For 250 grammes of the concentrated gum solution (prepared with 2 parts of gum and 5 of water,) two grammes of cryol. aluminum sulphate will suffice. This salt is dissolved in ten times its quantity of water, and mixed directly with the mucilage, which in this condition truly deserves the name of *vegetable glue*. Solution of alum serves the same purpose, but far less efficiently.

TRANSFERRING PICTURES TO GLASS.—Coat the glass with a varnish of balsam of fir in turpentine, then press the engraving on smoothly and evenly, being careful to remove all air bubbles. Let it stand for 24 hours, then dampen the back sufficiently to allow the paper to be rubbed off by the forefinger, rubbing it till a mere film is left on the glass, then varnish again.—*Sc. Am.*

ANOTHER PROCESS FOR PRESERVING MEAT IS ANNOUNCED. By this method the animal is killed by felling, and immediately skinned and cleaned. It is then glazed over with a preparation of sugar and alcohol and placed in a bed of fat. The case is exhausted of air and soldered up.

GOOD HEALTH.

The Causes of Decay of Teeth.

It has been charged against our brethren of the dental specialty, says the *Lancet*, that they are woefully at fault in regard to knowledge of the commonest of all things—causes of the teeth. That they extract teeth with skill, and stop them with even more skill, and in a nobly conservative spirit, is admitted; but the causes of decay in the teeth have remained obscure. The investigations of Leher and Rottenstein into this subject have at least the charm of pointing to definite conclusions. They admit, of course, that there are differences of teeth, constitutional and connected with race, making teeth more or less resistant to the great influences which determine decay. These are not, according to these authors, internal and vital so much as external and chemical. The process of decay begins from the surface, and if it can be controlled or arrested at the surface, it is entirely controlled. The great causes of caries are two, namely, acids and a certain fungus found abundantly in the month, *Leptothrix buccalis*. This latter agent is characterized by certain microscopic appearances and by its reaction with iodine and acids, which give to the elements of *Leptothrix* a beautiful violet tinge. Under the microscope the fungus appears as a gray, finely-granular mass or matrix, with filaments delicate and stiff, which erect themselves above the surface of this granular substance so as to resemble an uneven turf. The fungus attains its greatest size in the interstices of the teeth.

No one can deny now-a-days the action of acids on the teeth, even weak acids, in dissolving the salts of the enamel and the dentine. All acids, both mineral and vegetable, act promptly on the teeth. Various experiments as to the action of acids on dental tissues are given, making the enamel, naturally transparent, first white, opaque and milky, and, in a more advanced state, chalky, and then the dentine more transparent and softer, so as to be cut with a knife. The acids which may actually effect the first changes in the production of caries are such as are taken with food, or in medicines, or such as are formed in the mouth itself by some abnormality in our secretions, which should be alkaline, or by an acid fermentation of particles of food. But acids alone will not account for all the phenomena of caries in the teeth. They play a primary and principal part, making the teeth porous and soft. In this state, the tissues having lost their normal consistency, fungi penetrate both the canaliculi of the enamel and of the dentine, and by their proliferation produce softening and destructive effects much more rapidly than the action of acids alone is able to accomplish.

It is not pleasant to think that fungi exist in the mouth of all but the very cleanest of people. Bowditch, in examining forty persons of different professions, and living different kinds of life, found in almost all vegetable and animal parasites. The parasites were numerous in proportion to the neglect of cleanliness. The means ordinarily employed to clean the teeth had no effect on the parasites, while soapy water appeared to destroy them. If this be a true version of the causes of caries—the action of acids, supplemented by the action of fungi—then it follows that the great means of preserving teeth is to preserve the most scrupulous cleanliness of the mouth and teeth, and to give to the rinsing liquids a slightly alkaline character, which is done by the admixture of a little soap. This is not so pleasant a dentifrice as some, but it is effective and scientific. Acids not only dissolve the salts of the teeth, but favor the increase of the fungi of the mouth. No increase of fungi and no action on the dental issues occurs in solutions slightly alkaline, as of a weak solution of soap. The good effects of stopping teeth, in the light of these experiments, are intelligible. The penetration of acids and fungi is prevented.

EATING WHEN SICK.—It is the custom among a certain class of people, when a member of the family falls sick, to begin at once to ask, "Now what can you eat?" Every one has heard of the old story of the man who always ate eighteen apple dumplings when he was sick. On one occasion when he was engaged upon the eighteenth, his little son said, "Pa, give me a piece." "No, no, my son, replied the father, "go away; pa is sick." When a young man has surfeited in season and out of season, until exhausted nature gives way, and a fever is coming on, the good mother is in trouble. She anxiously inquires, "Now, John, what can you eat? You must eat something! People can't live without food!" Then comes toast and tea, etc. The stomach is exhausted, and no more needs stimulating or food than a jaded horse needs the whip. What is needed is rest. Nine-tenths of the acute diseases might be prevented by a few days' starvation when the first indications appear. I don't mean complete abstinence in every case, but perhaps a piece of coarse bread, with cold water for drink. If such a policy were generally adopted, what ruin would overtake the medical profession. How many physicians would lack for patients.—*Heath and Home*.

In the hydropathic treatment, drinking cold water immediately after rising, provided that breakfast be not taken for at least half an hour, is prescribed. The explanation given is that the internal douche acts upon the stomach as a tonic, in the same manner as cold applications externally, upon the skin.

Action of Tobacco Smoke.

According to Messrs. Vohl and Eulenberg, the amount of nicotine in snuff and tobacco for chewing is so minute that nothing like nicotine-poisoning can result from their use. The action of tobacco-smoke and tobacco-juice is not due to nicotine, for it contains none, but to pyridine, picoline, colledine, and other bases, forming a homologous series, which are produced during the combustion of the tobacco. The reason why stronger tobacco can be smoked in a cigar than in a pipe is, that in the pipe a large quantity of pyridine is formed, which is very volatile and stupefying; while in a cigar little pyridine and much colledine are formed. The unpleasant symptoms experienced by persons just beginning to smoke, or who smoke to excess, as well as the poisonous effect of tobacco-juice, are not due to nicotine, but to the pyridine and picoline bases; and they have probably been attributed to nicotine because these bases, especially those having a high boiling-point, greatly resemble nicotine both in smell and in physiological action, producing contraction of the pupil, difficult respiration, convulsions and death.

They do not act so quickly when injected under the skin as when taken into the stomach, and their action is less rapid than that of nicotine. Other plants which are sometimes used for smoking, though they contain no nicotine, such as dandelion, willow wood and stramonium, yield pyridine bases, whose action are very like those from tobacco, though rather weaker. Pure picoline from Boghead coal had a similar action; and its vapor was poisonous, producing irritation of the respiratory passages, slight convulsions, and death. None of these, except the bases from willow wood, produced contraction of the pupil. The authors consider that the effects produced by opium-smoking are not due to the alkalis in the opium, but to the bases formed during its combustion; and that the difference between it and tobacco is owing to different bases being formed by their combustion.—*Arch. Pharm. and Chem.*

Color Blindness.

The derivation of the designation of an affection of the eyes very commonly known as Daltonism (color blindness) is, as many of our readers are doubtless aware, from the name of the great philosopher, the propounder of the atomic theory, who was attacked by it. Properly speaking it is simply incapacity on the part of certain people to judge of color, or more accurately, of certain colors. Dr. Favre has communicated to the Congress at Lyons the result of the researches, which, as chief physician of the Paris and Lyons railway company, he has made on the subject, the object being to determine what influence this disease or affection may have on the general safety of travelers. According to this report, among 1196 different individuals examined from 1861 to 1868, thirteen cases of red-color blindness and one of green were found. Again, among 728 subjects examined between 1872 and 1873 he testifies to forty-two of color blindness more or less developed. He further estimates the number of people in France suffering from this malady at nearly a million, and gives, as the most common causes of it, wounds, typhoid fever, syphilis, etc. The danger of such a disease existing, and possible in some instances without the knowledge of the subject or of his employers, is one which deserves attention, for although we cannot point ourselves to any instances in which errors have been made through it, nevertheless, Dr. Favre, as we understand him, is able to do so, and we quite agree with him, when he says that the only effectual preventive of the dangers which may possibly accrue from such a malady is a periodical optical inspection of all men who have to deal with colored signals, a mistake in the use of which might lead to such disastrous results. We recommend inquiry on this subject to locomotive superintendents and traffic managers.—*The Engineer*.

SUNSHINE AND SLEEP.—Sleepless persons should court the sun. The very worst soporific is laudanum, and the very best, sunshine. Therefore it is very plain that poor sleepers should pass as many hours as possible in the sunshine, and as few as possible in the shade. Many women are martyrs, and yet they do not know it. They shut the sunshine out of their houses and their hearts, they wear veils, they carry parasols, they do all possible to keep off the most potent influence which is intended to give them strength and beauty, and cheerfulness. It is not time to change all this, and so get color and roses in our pale cheeks, strength in our weak backs, and courage in our timid souls? The women of America are pale and delicate, but with the aid of sunlight they may be blooming and strong.—*Home and Health*.

BORAX FOR COLDS.—A writer in *The Medical Record* cites a number of cases in which borax has proved a most effective remedy in certain forms of colds. He states that, in sudden hoarseness or loss of voice in public speakers or singers, from colds, relief for an hour or so, as by magic, may be often obtained by slowly dissolving, and partially swallowing, a lump of borax, the size of a garden pea, or about three or four grains, held in the mouth for ten minutes before speaking or singing. This produces a profuse secretion of saliva, or "watering" of the mouth and throat, probably restoring the voice or tone to the dried vocal cords, just as wetting brings back the missing notes to a flute when it is too dry.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mine Ventilating Machine; New Lard Package; Speedy Method of Working Quartz; The Hale & Norcross Mine, 161. Quicksilver; Oakland Harbor Improvements; Recent Patents, 162. Theatrical Machinery; Ophir City, Utah; The Colombian Mines; New Books, 169. Legislative; The Fares and Freight Bill; The Temperance Movement, 172. Patents and Inventions, 173.

ILLUSTRATIONS.—Mine Ventilating Machine, 161. Ophir City, Utah, 169.

CORRESPONDENCE.—Mining in Sierra and Plumas Counties—No. 3; The Laws the Miners Want, 162.

MECHANICAL PROGRESS.—Single Rail Railways; Improved Seeders; New Surgical Devices, 163.

SCIENTIFIC PROGRESS.—Vivisection; Color-Changing Iodides; A New Acoustic Pyrometer; Effects of Heat on Textile Fabrics; The Heat of the Moon, 163.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 164.

MINING SUMMARY from various counties in California and Nevada, 164-5.

USEFUL INFORMATION.—Separation of Gold and Silver from Lead; Why Alcohol Cures Rattlesnake Bites; Carbolic Acid; Alcohol from Sawdust; To Increase the Adhesiveness of Gum Arabic; Transferring Pictures to Glass, 167.

GOOD HEALTH.—The Causes of Decay of Teeth; Dorsax for Colds; Action of Tobacco Smoke; Color Blindness; Eating when Sick, 167.

MISCELLANEOUS.—The Taylor Mine; Mining at Shoshone; Mining Towns in San Juan, 162. Bingham Canon Mines; Idaho Mines; Mining at Belmont; New Method of Engraving; Rich Quartz; Mining Activity; Protection to Stockholders; Mining Suit; Panama; A Heavy Shipment; Mineral King Wagon Road, 166. Arizona Mines and Mining; The Everlasting Mine; New Quartz Mill; Big Figures; White Pine; Utah Mines; Arkansas Dam; Wadsworth Mining Matters; Prospecting; Sonoma Mines, 170. The Brains of Idiots; Preserving Wood; Siskiyou County Mines, 171.

THE STICKLEEN MINES.—Advice from Victoria dated the 5th inst. state that the steamer "Eliza Anderson" arrived from Cassiar on the previous day, and reports that all the miners are pushing on, none returning. As yet there is no information from those who have gone on. On the 27th ult. all then at Wrangle were to start for the interior. The "Anderson" made the round trip in nine days' running time. The Hudsons Bay company's steamer "Otter" also arrived at 6 p. m., from the same place, but brings no later intelligence. The following information will interest those who propose to visit the Stickleen mines: The average temperature at Fort Wrangle, from November 26th to December 1st, noted twice a day, 9 a. m. and 3:30 p. m., was 31 degrees below zero; from the 1st to the 28th of December, the average was 29 degrees. The coldest snap was in January, when the mercury congealed. Those who go up before the first of May will surely suffer. Dispatches dated at Victoria, on the 11th ult. say: The steamer "Eliza Anderson" sailed last evening, and the "Otter" this morning, both for Cassiar, carrying about 125 passengers. The steamship "California" from Sitka passed down this morning. She brings no news of any importance from Cassiar. The miners are going into the diggings, notwithstanding the intensely cold weather.

The wood of the osage orange is found to be useful for many purposes. An eastern paper states that a correspondent, who has been experimenting with the wood of the osage orange says that it takes a fine polish, and is very durable. The wood grown in Texas is found to be durable in all situations, and none more so than in fence posts. It is largely used for wagon wheels, and the wheels made of it are said never to require a second hooping. In Pennsylvania it is of slow growth, but further south it finds a congenial climate, and grows rapidly. If seed is to be sowed, the trees should be planted in clumps, in order that fertilization may be perfect.

The whole production of the precious metals throughout the world during 1873 is estimated to have been worth \$219,000,000.

The Mission Quicksilver Mine, Napa county, on Tuesday last, turned 1,800 pounds of rock in eighteen hours, producing 126 pounds of quicksilver.

Quicksilver.

Quicksilver is now quoted at \$1 37½ in gold in New York. Here the price still remains at \$1 20 per pound, as against 85 cents per pound last year. This is a very heavy tax on our mining interests; for, considering that we use 1½ pounds of quicksilver in working a ton of ore, it now costs \$2 10 for every ton worked, where it used to cost only \$1 45. We have frequently referred to this matter in our columns, and as often stated that the only way to remedy this state of affairs is to open and properly develop some of the lately-discovered deposits of quicksilver in California. There is a good deal of talk about "quicksilver monopoly," which is all bosh. That monopoly was broken up some time ago. The mines are all working on their own account now, and it would not pay to reduce production at the present high rates. A number of the mines opened last year are producing metal, but none of them as yet come up to the New Idria, New Almaden, and Redington, which formerly constituted "the monopoly." The St. John, Great Western, Phoenix, and some few others, promise well for an increased production, but as yet their yield is comparatively small.

The New Almaden mine, the production of which was stated to be 12,000 flasks last year, has turned out to be but 11,042, a difference of over 7,300 pounds. The percentage yield was but 4.87. We mentioned in our issue of the 28th ult. that we had called at the office of the company here and that they stated that the yield of 12,000 flasks was correct. Mr. Randolph the Superintendent of the mine tells us that the yield was but 11,042, and that the "office" in this city is merely the agency for the sale of the metal, and they know nothing of the details of the mine operations. The decreased production of this mine alone would have the effect of raising the price of quicksilver, especially as the demand for it has so materially increased.

We notice that one of our contemporaries in this city states that "any man now, who makes a discovery which is likely to furnish even a moderate amount of quicksilver, can obtain advances on his mine, so as to change the ownership very readily." They can't do any such a thing, and that is what is the matter with the price of quicksilver, not the "monopoly!" If the person that wrote that item can point out the man who will buy these mines, or make advances on them, he will confer a great favor on a good many deserving prospectors. The San Francisco capitalists are afraid to touch any of these discoveries, unless they have a sure thing of it, and "sure things" can't be found in quicksilver mines; hence, they do not invest. It takes a well-developed mine, a good location, plenty of ore on dumps, plenty more in sight, and a good deal of palaver, to get these capitalists even to look at a quicksilver mine, and they are very shy of buying them. The capitalists would rather get cent. per cent. sure, than put any money into uncertain mines, even with prospects of high interest on their money.

We know of numerous instances during the past winter when men, who had discovered cinnabar deposits in Lake, Sonoma or Napa counties, have spent months in this city endeavoring to get capital to aid them in opening these mines, and most of them have gone back disgusted. They are compelled to travel round day after day, and week after week, after these men of means, only to be put off, from time to time, and eventually neglected altogether. There isn't any capitalist in this city that wants to go into quicksilver mining, unless they could buy a New Almaden or Redington. They will not risk their money in opening and proving a deposit, for they can find safer investments. If the mining interests suffer for want of quicksilver, as they do, it is the fault of rich mining men, for not assisting to develop mines of this class. Until such assistance is rendered, we must expect to pay exorbitant prices for our quicksilver; even higher, perhaps, than we pay now.

Cinnabar mines are so extremely unreliable, that it is difficult to predict the future of any of them until they are well developed. Many of the mines lately discovered in Sonoma, Lake, Napa and Solano counties, promise well for the future, but as yet, few of them have been developed to any extent. When eight or ten these are provided with the necessary reduction works, and developed on a good scale, perhaps quicksilver will come down, but until this capital is forthcoming, we may expect high prices. With all the talk about quicksilver monopoly, it is a simple fact that it is the backwardness and want of enterprise in our capitalists that keeps quicksilver where it is.

MINING LAWS.—An interesting letter on this subject from a practical miner will be found on our second page this week. It contains some valuable suggestions and will be read with interest by mining men. If miners would often ventilate their ideas in the columns of the Press it would result in great benefit to the whole fraternity. The suggestions made by Mr. Lloyd are well worth consideration by our law makers, and he explains the provisions in a way that shows he has discussed the subject with other miners.

Oakland Harbor Improvements.

The report of the United States Engineers, on the proposed improvements in Oakland Harbor has been transmitted to the authorities at Washington. This report is signed by G. H. Mendell, C. S. Stewart and B. S. Alexander. After a long, detailed description of various surveys and soundings, and scientific discussion of securing the effects of tidal currents, etc., they submit and recommend the following comprehensive plan: First, that San Antonio Creek be confined within two parallel training walls or bulkheads, of stone, one thousand feet apart, and that these be carried out over the bar to a point opposite the end of the railroad wharf, where there is now a depth of sixteen to eighteen feet at low water. Secondly, that a canal be excavated from the head of the estuary to San Leandro Bay. Thirdly, that a dam be constructed across the entrance of San Leandro Bay. And fourth, that the latter be dredged so as to make it a tidal basin. This tidal observation taken by them, show that the water runs a little higher and falls a little lower in San Leandro Bay than in San Antonio Creek, the mean difference being about four tenths of a foot. The times of high and low water are later in San Leandro Bay than in San Antonio Creek, the difference being about one hour. The extended training walls are to be constructed to a height of four feet above low water, and will therefore be submerged at high tide. They say the effect of all this will be, that the ebb water will dredge out a channel of fourteen to sixteen feet deep, at low tide, between the whole length of the training walls, and make a harbor at Oakland capable of accommodating at one time forty large ships, together with ferry boat and small vessels. Such accommodations, they argue, are necessary for the overland freight and travel, which are now exposed to the dangers of an insecure wooden wharf. It is intimated, also, that the interests of San Francisco and Oakland are identical, or at least as closely connected as those of New York and Brooklyn. The engineers recommend that the execution of the first division of this plan be provided for at this session of Congress, by the appropriations of \$479,074, which they estimate at its cost including the dredging of the artificial channel between the training walls, which, after the rest of the plan is accomplished, will be kept dredged out by the ebb of the tide from San Leandro Basin. They estimate the cost of excavating the canal at \$350,000, cost of dam at \$65,000; cost of dredging out San Leandro Bay, so as to make it a proper tidal basin, at about \$920,929; aggregating for the whole scheme, \$1,815,003. This, however, they say will not cover the land damage and bridge involved in the construction of the canal, and does not provide for the complete conveniences for commerce, the construction of which they think may safely be left to the interests concerned.

The report then goes on to say that when the work described is completed Oakland and Alameda will have a fine land-locked harbor or basin, capable of accommodating forty large ships at the same time alongside their wharves, with room for as many more at anchor in the estuary, and have room besides for as many slips as would be wanted to accommodate travel. Oakland is not a port of entry; the nearest port being San Francisco, distant about five miles. Oakland is so intimately connected with San Francisco that the interests of the two cities, if not identical, are as nearly allied as those of New York and Brooklyn.

We learn from the newspapers of the day, that there were 67,000 overland passengers, 2,000,000 ferry passengers, \$32,000,000 in treasure from the mines of California and Nevada, 450,000 tons of general freight, 161,000 tons of wheat, valued at \$6,440,000, all passing over the long wharf at Oakland during the past year.

As both travel and trade between the two cities is increasing rapidly, and the present wharf is only a temporary one, it would seem that the interests of the two cities would be greatly increased by some more permanent landing at Oakland.

If such be the views of Congress, and if he decided to improve the harbor of Oakland, we recommend the appropriation of the amount necessary to construct the two training walls, and dredge out a channel between them one hundred feet wide, having a depth of six feet at low water, at the present session of Congress, \$479,094.

This amount would give a beneficial and useful result at once, and establish all the travel and much of the trade between the two cities, on a better basis of communication than it now has.

COAL is found in a number of the small gulches among the bald hills of the Buttes, lying in thin layers between strata of clay, from one to several inches in thickness, and on a considerable slant. Some of these streaks contain fine specimens of bituminous coal.

A CORRESPONDENT of the Sutter Creek Independent, writing from Lancha Plana, says the mines are about played out in that neighborhood. The only chance there is for the place to regain its former prosperity, or even the shadow of it, is the much-talked-of railroad from Stockton to Ione.

At present about thirty-two trains make daily trips over the Virginia and Truckee railroad.

Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

EYE GLASS.—Lonis A. Berteling, San Francisco, California. This invention provides an improved saddle or clamp for fastening the eye glasses upon the bridge of the nose. It consists in attaching the shoes or clamps to a spring in such a manner that they will possess an elasticity both at the top and bottom. The clamps will then adjust themselves to the seat or shape of the nose without pinching, and at the same time have a stronger and firmer hold.

CAR PROPELLER.—Fayette Mace, Jackson, Amador county, California. An arrangement by which a running stream is made to propel a car in either direction along its bank. Mr. Mace proposes to construct a railroad track alongside a mining stream or ditch which has a current, and place upon it a car. This car will be provided with a shaft which extends out over the stream. A wheel, similar to a paddle wheel is attached to the end of this shaft so as to dip in the water. A gear wheel on this shaft engages with a gear on one of the bearing wheels of the car so that when the current revolves the wheel and shaft the bearing wheel of the car is turned so as to carry the car up the stream, when the car has arrived at the head of the stream and received its load the gear wheel on the shaft is disengaged from the bearing wheel, and the shaft is fixed by a clutch so that it cannot revolve. As one or two of the hockets or wings of the wheel will then be in the water the current will carry the car down the stream. This arrangement is especially adapted for propelling a wood or lumber car from the foothills down to some shipping point.

PLANK ROADWAYS.—Cornelius McGowan, San Francisco, California. This invention consists in constructing plank roadways of boards which are thicker at one end than at the other and in placing the thickest portion in the middle of the roadway where the most wear occurs, while the thin portion is placed next to the sidewalk where there is the least travel.

SHIRT FRONT.—Ismar Zachariae, San Francisco, California, provides a shirt front the upper half of which is made of linen while the lower portion is made of colored material. At the point of junction in the middle of the shirt bosom is a flap the upper surface of which is linen (usually an extension of the upper half of the shirt bosom) while the under part is formed of the same material as the lower portion. By turning the flap up and buttoning it upon each side of the neck the linen portion is covered and the colored side exposed, but by turning the flap down the linen front is exposed.

VACUUM RELIEF VALVE FOR STEAM CYLINDERS.—Andrew J. Stevens, Sacramento, California. This invention provides a relief valve in the steam dome of the boiler, which is connected with the steam cylinder so that when the throttle is closed and the locomotive is running on a down grade without steam, the vacuum usually formed by the pumping action of the piston will be relieved and the piston lubricated.

IRRIGATION PIPE.—Nehemiah Clark, S. F., Cal. This invention relates to an improved arrangement for coupling underground irrigation pipe by which the water is allowed to escape at the joints, without danger of clogging the escape opening.

CUTTING APPARATUS FOR HARVESTERS.—Philoander Kitts, Monticello, Cal. This invention consists in an improved cutter bar for headers by which the heads of grain are prevented from dropping in front of the sickles after it is cut. The improved arrangement also strengthens the cutter bar while it is rendered much lighter than formerly.

SEED SOWER.—John B. Nixon, Cottonwood, Cal. Relates to an improvement in broadcast seed sowers, and consists in providing a simple arrangement, whereby the direction of the rotation of the distributor can be reversed so as to scatter the grain in an opposite direction alternately thus sowing it more uniformly.

PACIFIC SHIPBUILDING.—A strong company has recently been organized to carry on extensive shipbuilding operations on the Pacific Coast. The principal parties recently met in Washington city to perfect their plans. Among them are Richard Vance of Bath, Maine; Mr. Cheung, brother of Caleb Cheung, of Newburyport, Mass., and the leading New York shipbuilders. Erastus Bartlett of California is also connected with the enterprise. The company has not yet determined whether to establish their works at Puget Sound or Port Oxford or Elgin. They intend to build ships, manufacture lumber and work coal mines. They will sell the ships and cargoes in foreign ports.

The shipment of bullion from Pioche for the month of February was very light, being only \$170,229 05.

The road from Treasner Hill to Eberhardt is still blocked up with snow, and teams are unable to get down with rock.

Theatrical Machinery.

Perhaps no class of persons in the world require the genius of invention more than stage carpenters. Every new play must have its appropriate machinery arranged to work with the utmost precision, so as to produce the most deceptive effect upon the audience. Some of the devices and apparatus used on the stage possess remarkable features of mechanism, requiring originality of the first order, and although these devices are seldom patented, many of them show more real ingenuity than three fourths of the inventions for which patents are obtained. Yet, with all of this ingenuity in devising and constructing novel machinery for producing startling scenes upon

the stage, but little improvement has been made in the mechanism for working the permanent apparatus of the stage. To-day the drop scene is rolled up by cords and pulleys operated by hand, at the proper signal, in the same manner that it was rolled up fifty years ago; and who has not often witnessed the distressing accident of two flat scenes positively refusing to come together properly just at a time when it was particularly necessary to shift them quickly? We have recently forwarded to the patent office the application of Mr. H. F. Parsons, a resident of Los Angeles, in this State, for some very useful and ingenious improvements in the permanent mechanism of a theatrical stage. To the first place Mr. Parsons proposes to paint the scenes on wire cloth instead of canvas, as heretofore. One or two preliminary coats of paint upon the wire cloth, he states, will completely fill the meshes so that a perfectly opaque and uniform surface is provided. Mr. Parsons claims that there will be a saving of 30 per cent. in the amount of paint required to complete the scenes. He proposes to use wire cloth, not only for the flat scenes, but also for the wings and flies, and to use wires instead of ropes for operating them, thus rendering the stage comparatively fire-proof, and effecting a reduction of 70 per cent. in the insurance rates. The scenes thus made will also be more easily handled. Instead of ropes and pulleys for raising and lowering the drop scene, Mr. Parsons will employ a small water-wheel driven by water conveyed through a pipe connection with the water main of the city, and the valve will be controlled by the prompter, so that he can, at the proper moment, drop the scene without depending on an assistant. Besides the above improvements, Mr. Parsons has provided a number of others, by which the flat scenes, wings and flies, can be easily worked by one person instead of the large number heretofore required. He claims that a saving of 60 per cent. in the labor of operating stage machinery is obtained by his improvements, besides every part is so adapted as to work smoothly without noise or stoppages.

Mr. Parsons expects to place his improvements on some of the theatrical stages in this city during the coming summer.

MINING ACCIDENT.—About eleven o'clock on Friday night a miner named Richard McCarty, made a fatal misstep in the shaft of the Caroline mine, at Pioche, and falling a distance of 225 feet was instantly killed. It seems that McCarty was being lowered into the shaft, but when near a station he rang the bell, intending to get off at the station and procure something that was needed at the bottom. He rang the bell before the cage had reached the station, and in stepping from the cage he missed the point at which he aimed and fell to the bottom of the shaft. He must have fallen the entire distance without touching either side of the shaft, for neither his head nor his face was bruised at all, but his legs and thighs were broken in many places, and his neck was also broken.

THE STATE OF THE ROADS ABOUT EUREKA has caused about 1000 tons of ore to accumulate at the Eureka Consolidated, which, combined with the scarcity of coal, prevented the working of the furnaces, and necessitated the discharge of several workmen.

Ophir City, Utah.

The accompanying cut, originally published in the *Utah Mining Gazette*, represents a view of Ophir City, Ophir District, East Cañon, Utah. The town, as will be seen by the engraving, is situated in a cañon, two miles from its mouth, easterly, in the midst of the mineral belt, which stretches north and south, a distance respectively of four and three miles. In the town and vicinity there is a population of 1,000, to which may be added 500 more residing in different mining camps. The town has a good hotel, post, express and telegraph offices, which, with the smelting works and mills in active operation, impart a lively and business-like appearance to the place.

OPHIR CITY, UTAH.

Alpha district, in which the town is situated, is on the west side of that portion of the Oquirrh range, immediately south of Stockton district, and distant from the latter town about 8 miles. According to a pamphlet on the "Mineral Resources of Utah," by John R. Murphy, discoveries were made in this cañon as early as 1864, but being of the base metal class, with only a low per cent. of silver, attracted no particular attention until 1870, when the first discovery of horn, or chloride of silver, ore was made. The ore from this discovery assayed so high that it created quite an excitement which led to a rush of people to the place. Ophir district is divided by the cañon, which runs east and west, into the south or horn-silver high-grade section, and the north or argentiferous galena low-grade section.

THE YAKIMA MINES.—Late intelligence from the Yakima mines is not very encouraging. The *Lewiston Signal*, which has the latest, says: Al. Talkington, who has just returned from the Yakima mines, reports the diggings a failure; says he, in company with some old miners, were allowed to prospect the discovery claim, which was considered the best of any there; and, after sinking twelve feet to the bed-rock, washing out over a dozen pans of dry dirt, they obtained in all, about five cents. Some nuggets were exhibited which were said to have been taken out of the mines there, but Kootenai miners present could not be deceived; they knew they had come from Kootenai, and were being used for "salting" purposes. The man who induced Talkington and party to go to Yakima, turned up missing.

FUEL ON THE COMSTOCK.—The following are the present retail rates for fuel at Gold Hill, Nevada: Nut pine, \$16 per cord; limb wood, \$15; split wood, \$14; coal, \$22.50 per ton.

The Colombian Mines.

We have several times of late spoken of the newly discovered gravel deposits in the United States of Colombia which have lately attracted some little attention. On examining a large and detailed map of the country at the office of the Consol, we were surprised at the innumerable watercourses traversing the country and could well believe the assertions made as to the never-failing water supply for mining operations. The country is, however, in want of capital. We have been shown a letter from a resident of the mining regions there who owns a large tract of mineral land most of which is situated on the right bank of the large river Yambi, at a distance of two or three miles from

New Books.

We have received from the publishers, A. L. Bancroft & Co., a copy of "Copp's United States Mining Decisions," containing the decisions of the Commissioner of the General Land Office, and the Secretary of the Interior, under the U. S. mining statutes of July 26th, 1866, July 9th, 1870, and May 10th, 1872, with appendix of circulars and forms. The three laws referred to are given in full as are all the decisions bearing on mining interests, under these laws, as well as the instructions under them from the General Land Office. This work is merely a collation of all the decisions relating to the mining interests, but is a valuable one for reference, as all the information on these

subjects, possible to obtain, is within its covers. It is issued in the form of an ordinary law book in a durable binding. Recorders in mining districts, justices of the peace, editors who are in mining localities, lawyers and many others will find Copp's United States Mining Decisions of great convenience. It gives the law on the subject, stripped of all verbiage and in a comprehensive form.

We have also received from the author, John A. Chmeh, M. E., "Notes of a Metallurgical Journey in Europe," with 22 illustrations, (D. Van Nostrand.) The papers first appeared in the columns of the *Engineering and Mining Journal*, and are now republished in book form. The author in his preface makes the following noteworthy remark: "It is frequently said that American genius can be trusted to devise its own processes, and need not go abroad for instruction, but no one who is acquainted with the industry, skill and devotion of European metallurgists to their work, can be willing to lose the fruits of their experiments and thought. Few persons know how much time and money are spent by them every year in the work of revising old established processes, both by laboratory examinations and by experiments conducted on the largest scale. The little book is an interesting one to the mining engineer and metallurgist and is trustworthy, as the author only describes those works visited and carefully studied by him."

The "Transactions of the American Institute of Mining Engineers," Vol. 1, from May 1871, to

February 1873, was also received by us this week. The volume contains the rules of the Institute, a list of members and associates, and abstract of the proceedings of the first two years, and a number of papers selected from those proceedings. The papers have already been published in the official organ of the Institute and are republished in pamphlet form, so that members can preserve them conveniently. The majority of the papers are of more interest to miners in the East than to us on this Coast, as they treat largely on coal, iron, etc., to which we on the Pacific pay little attention.

MECHANICS' INSTITUTE.—At the quarterly meeting of the Mechanics' Institute on Saturday evening, the President, Mr. A. S. Halliday, submitted his report. From this it appeared that during the quarter 157 new members joined the association, and 294 volumes were added to the library. During the same period 19,720 volumes were withdrawn from the library and read by the members. The President reported that a course of fifteen lectures, delivered by the professors of the University of California, was in progress. In conclusion, he called the attention of the members to the fact that the Society was now sorely in need of funds wherewith to buy technical works of reference. With a view of supplying the deficiency and placing the Institute on a firmer basis, an industrial exhibition will be held next fall. The Board of Managers having control have advertised for the plan of a suitable building to be erected on the two 100-acre lots on Eighth street between Mission and Market. The receipts for the past quarter were \$3,946.25, and the disbursements \$3,705.89.

TEN tons of borax were shipped from Esmeralda county last week.

TUNNEL LOCATIONS.—"G H" is informed that tunnel locations cannot be patented, but the lodes discovered in running a tunnel may be patented upon full compliance with the law. There is no specified amount to be expended to retain the ownership of a tunnel location, but owners are required under the law to use reasonable diligence in working and advancing their tunnel. Failure to prosecute the work on a tunnel for six months is considered as an abandonment of the right to all undiscovered veins on the line of tunnel.

"JIM WHITLACK," of the California quartz crushing and ore sampling mills, of this city, has gone east to secure the aid of capitalists in putting up a mammoth quartz mill in San Bernardino county.

Arizona Mines and Mining.

A pamphlet has recently been issued by A. K. P. Safford, who was appointed Commissioner to prepare and publish information on the resources of Arizona by the Legislative Assembly, in which are numerous interesting facts relating to that rich but out-of-the-way Territory. In the chapter on mines and mining we find the mining situation of this Territory condensed in the following interesting manner.

It is impossible, in the limited space afforded in this pamphlet, to give an adequate idea of the mines of this Territory. There is scarcely a mountain or hill within this Territory that does not contain veins of gold, silver, copper and lead. Owing to various causes, principally Indian hostilities, this vast wealth has been but little developed, and is yet but imperfectly understood. I shall only attempt to refer to a few of the most prominent mining districts, and, in order to make the reference as brief as possible, I shall class them by counties.

Yuma County.

Gold, silver, copper and lead are found in lodes near the Colorado river, the entire length of the county; also placer gold in considerable sums has been extracted. No effort has been made to conduct water to these mines; the gold has generally been obtained by what is called the dry-washing process. To pay by this process, the mines must necessarily be very rich, but if water could be obtained, they would undoubtedly pay well, even when once worked by the other process.

Many lodes of gold, silver, copper and lead have been located, and quite a profitable business engaged in by shipping the ores via the Colorado river to San Francisco. The success of these enterprises would warrant the belief that by the erection of machinery and properly opening the mines, they could be made very profitable to the owners. Along the southern border of the county, extensive and rich mines of copper are found, but owing to the high rate of transportation have not yet been made to pay.

Mohave County.

It has been known since the organization of the Territory, that nearly all the mountains in this county contained lodes of gold, silver, copper and lead, and, in 1863, an attempt was made to develop and work some of these lodes; some machinery was erected and considerable money expended, but, as has been the case in nearly all new mining counties, from hostility of Indians, extravagance, want of experience, etc., the investments proved disastrous, and the mining interest has been paralyzed.

About two years ago, operations were again commenced and quite a mining settlement has sprung up at Wallapai about 30 miles east of the Colorado river. A vast number of new mines have been discovered, and new districts have been formed for many miles around. It will be seen by reference to the statistics of Mohave county that the ores that have been shipped and worked are remarkably rich, and from frequent personal examination, I am convinced that, with capital prudently invested, this will prove to be one of the richest and most extensive mining sections on the Pacific Coast.

Yavapai County.

Owing to the hostility of the Apache Indians, prospecting and mining has been much retarded over a large portion of the county, but sufficient explorations have been made to demonstrate the fact that it contains extensively rich mines of gold and silver—scarcely a mountain has been examined that does not show rich deposits of these metals. Placer gold is found over a large extent of country, and during wet seasons these surface mines are worked with great profit.

For three years water has been scarce, and but little work has been done on the immense gravel beds found near Prescott, but from present appearances a bountiful supply will be had the coming spring; and with a plentiful supply of water, thousands of men could obtain employment near Prescott in placer mining. The discovery of gold and silver quartz lodes are so numerous that it is out of the question to give room in this pamphlet to mention but one or two of the leading ones: The Vulture mine at Wickenburg is principally of gold ore; the lode is large and well defined. A forty-stamp mill erected at Wickenburg was kept constantly employed crushing ore from this mine for several years, but owing to the great cost of bringing the ore from the mine to the mill, a distance of 15 miles, and mismanagement of those who controlled it, work was some time ago suspended; but there is in sight at the mine thousands of tons of free gold ore, worth \$15 to \$25 per ton, and the time is not far distant when it will again be worked with profit. Messrs. Smith & Taylor, two practical mining and mill men, have for the past six months been running a ten-stamp mill on an extension of this lode with great profit, probably not making less than \$200 per day, after paying all expenses. In the Bradshaw district the Tiger lode gives promise of taking an important position beside the great silver-bearing mines of Mexico and the United States. The lode is wide and regular in its formation; a careful assay of about

700 tons on the dump shows this ore to be worth \$100 per ton, and from this, 35 tons were selected and shipped to San Francisco, and were disposed of for \$17,000. There are also many other valuable mines in this district. Considerable gold is being taken out by assays in this district, at Prescott, Walnut Grove and Antelope, and without the aid of capital. Our hardy miners, now that the Apaches have been made quiet, will soon demonstrate with gold and silver bars the mineral wealth of the Territory.

Maricopa County.

But very little prospecting has been done in this county, but sufficient to demonstrate the existence of veins of gold, silver, copper and lead in nearly all the mountains. The most important discovery yet made is the Silver Queen, twenty miles north of Florence; and most excellent prospects have been found in the Pinal mountains. An excellent vein of coal has been found near Camp Apache, and also a mountain of pure salt on Salt river. Many legends have been told by captives who have escaped from the Indians, and by Indians who have been taken as prisoners, of the existence somewhere in this section of rich placer mines, but all efforts to find them have so far proved futile.

Pima County.

Nearly all the mountains contain veins of gold, silver, copper and lead, and long before the country was purchased from Mexico, gold and silver mining was carried on to a considerable extent. After the purchase, the attention of capitalists was attracted here, and considerable money was invested with fair prospects of success. About this time, the Great Rebellion broke out, and the Confederate forces took possession and confiscated or destroyed all property known to belong to Union men; then the Union forces re-took the country, and confiscated or destroyed all property known to belong to those in sympathy with the Rebellion, and the Indians and marauding bands took what was left, irrespective of creed or parties. This effectually destroyed all mining enterprises, and it is only until within the past year that any effort has been made to revive the mining interest. During this time, considerable prospecting has been done, and a number of patents have been applied for. Sufficient developments have been made to warrant the belief that with capital well directed, a very extensive mining field would soon be opened. Certainly there is an abundance of ore, and assays and working tests show that it can be worked to great profit.

The Everlasting Mine.

The following item we take from the *Calaveras Citizen*: Drifting at this mine proceeds but slowly, owing to the hardness of the rock, and it will probably be several weeks before the proposed destination is reached, and the superintendent's theory be verified or disproved. If he has not been misinformed in regard to former workings of the mine the chances are greatly in favor of success. Last Tuesday we paid the mine a visit and consider it time well spent. The history of the mine and the facts upon which the present change of programme is based are as follows:

Several years ago Scieffard, and his partner sunk a shaft 45 feet north of the one on which the company's work has been done, and had good rock in the bottom—45 feet—but being unable to continue on account of water, left this shaft, which has filled in. The rock taken from the shaft still lays around it and prospects richly. The company's shaft is 50 feet west of this old shaft, pitches considerably and has no sound indications of being on the lead at all. In fact from developments which have been made—as explained to us—there can be little doubt that the true vein is the one on which the old shaft was sunk and which is almost perpendicular. The difference in the dip of the two shafts would make it expedient to drift from the working shaft to the old one as near the surface as possible. This is what is now being done; at the depth of 80 feet a drift is being run toward the abandoned shaft which is now in 15 feet. Should expectations be verified, and the lead be found, a new shaft will have to be sunk. North of the mine the lead can be easily traced in a straight line which would bring it directly over the old shaft.

Such are the facts of the case as explained to us by the superintendent, and we, in common with all the residents of this section hope for the best, and second to the owners of the mine, will be benefited by its success.

NEW QUARTZ MILL.—The *Mountain Messenger* says: Manson & Co., of the foundry, are building a quartz mill, the stamps of which are to be worked by Manson's "Elastic Power" device. The arrangements of the stamps and battery are peculiar, and original with Mr. Manson. Portions of the frame have already been cast. It will be put in operation on a ledge near town early in the spring. Each stamp will drop 200 times a minute with a crushing force equivalent to a 1,500 pound stamp dropping 14 inches at 60 drops a minute. The stamps will weigh 450 pounds each.

BIG FIGURES.—In Germany there are at present some twelve large manufacturing factories of alizarine from coal-tar, and the product, which is rapidly increasing, is now 25,000 hundred weight per annum, valued at \$2,000,000. Germany also supplies the world with aniline colors.—*Gas-light Journal*.

White Pine.

In an article entitled, "Fact stranger than Fiction," the *White Pine News* makes the following statements:

In previous issues of the *News* we have given many facts regarding the amounts of ore taken from our various mines, which have gone to add materially to the wealth of Nevada, and of the world. Fact is often found to be stranger than fiction, and figures will not lie. For a long time we have been laboring under great depression in all branches of our mining interests, from reasons often set forth by us. That the fault of the present dullness and apathy here existing is not to be ascribed to the county itself, we have always held, and have taken much pains to support and strengthen our advanced opinion by facts and figures. From the most reliable source, that of the Assessor's books, we glean the following interesting exhibit, which we are confident is under instead of over the true production of White Pine district. As these same figures have been obtained from A. J. Brown, a gentleman employed hunting statistical information bearing upon the mining interests of this district, and forwarded to Mr. Raymond for the purpose of being incorporated in his annual report, we have no hesitancy in pronouncing them as nearly correct as it is possible to obtain the same.

This whole number of tons of ore, of all characters, produced in this district up to, and including Jan. 1st, 1874, was 186,048, which gave a gross yield of \$8,767,484! This grand total shows the value of each ton of ore to average \$47.07. Included in the above amount were 10,445 tons, taken from our base metal mines on the White Pine Mountain and vicinity, which yielded \$445,000 in silver and lead, averaging \$42.70 per ton. Nearly nine millions of dollars extracted and sent forth from our mines in four years! It is perhaps a circumstance unknown to many that so much wealth has been taken out from this locality as the above goes to prove, but those doubtful of the fact have only to take the pains to look over the returns made during the time mentioned, and be convinced of the truth of our statements. It is certainly the height of folly to advance an opinion that no more mineral exists in the mountains from whence this was extracted, and we have but little patience with know-nothing scoffers, such as we meet frequently, who, with that egotism in their own views born from ignorance, confidently and knowingly, say "White Pine is played out!" We regard this county to be just on the turn in her history, and confidently believe that before many months our bullion product will again astound the mining world. We have men left here who have struggled on through years of adversity and borne up under the disappointments of hope deferred, brought on by the acts of unscrupulous speculators and their damning influences, who still know that success awaits them and are content to stay until the future shall work out their salvation.

A query suggests itself right here, that is, if, as the statistics show, \$445,000 in silver and lead was the product of our base metal interests in the past, with the crude manner of smelting then in vogue, why should not millions of dollars reward efforts to be made in the future, with the knowledge of the business gained in years of experiments resulting in the successes apparent in Eureka and elsewhere? All the necessary adjuncts to successful smelting of ores exist on White Pine Mountain that prevail elsewhere; our ore is richer in precious metals than at any other point, and only await comprehensive and judicious handling and treatment to make our county the most productive of all the rich sections of Nevada. We are anxious for the right men to commence operations on the extensive interests here and carry to a certainty our firmly rooted theory of the wealth of White Pine. Although our anticipations of the early development of our district may be unfounded, the fact still holds good that the wealth is here and will some day be utilized. From time to time we shall take pains to present new facts and figures, with earnest faith that our endeavors may induce men of means and of knowledge in mining matters to test the truth of our assertions. Many thousands of dollars and pounds, thrown away on wild-cat speculations, could be made to pay astonishingly large interest, if judiciously invested in properties now lying idle in this vicinity; and, we opine, that before long the numerous failures resulting from impracticable investments will teach operators to seek for opportunities such as we have to offer them.

UTAH MINES.—The *Salt Lake Tribune* says: The mining prospects of the Territory are brightening, and business is rapidly recovering from the stagnation incident to the monetary panic of last fall. There was a time, a few months since, when the money requisite to pay the freight on bullion could not be obtained, and the price of ore was so low, that, in some instances, it scarcely paid for shipment. Now, both ore and bullion command the highest figure, and many companies, that have been in financial embarrassment, will soon be able to pay off their indebtedness and extend their operations as the season advances. The mining outlook for the coming summer is very encouraging, and there is but little doubt, that before another winter, the permanence and intrinsic value of a number of the leading mines of this Territory will be placed beyond all peradventure.

Arkansas Dam.

Thus far the season has been a very good one for the miners on the river above Junction City, and they have not been slow to profit by it. At present the cold nights have shortened the water somewhat, so that there is no surplus above what the ditches will carry. At Arkansas Dam, Post & Glover have opened a new claim back of the site of the old trading post. They have not done a great deal of washing yet; the ditch which conveys water to the claim, being new, has been the source of considerable trouble by sliding; but, with settled weather, they will have a better opportunity of testing the ground. What work has been done exposes a bed of gravel which deepens with the rise of the hill, being seven or eight feet thick as far back as worked. It all contains fine gold; but, being cement in character for two or three feet above the bed-rock, is difficult to work. The ditch digging proved a greater job than they had anticipated, so the claim is not so well supplied with reservoirs as it should be to take advantage of the water supply. In another year this can be remedied. On this hill, back and below Post & Glover, the Sheridan Brothers have a fine run of water from Simpson gulch, and are using it to the best advantage. Chapman & Fisher, opposite, are running both their claims to the full extent. The upper claim is worked with 15 inch pipe and a 6 foot flume; the lower one on a smaller scale. They have made one clean-up in the lower claim—we did not get the full figures, but learn that the under-current alone yielded \$150. Prater & Gribble have a fair supply of water from their gulches; and, by hiring a pipehead from Chapman & Fisher's ditch, can work to good advantage. The claim of Fisher & Prater has also had a better show for water this year than ever before. Billy Lulo works from the lower ditch, and has done very well thus far. The boys console themselves for the present scarcity of water, with the thought that the deep bank of snow which cover all the high mountains will have to come down some time or other. Of the claims below we heard nothing, except that all hands were busy at work, and that the water supply had been very fair thus far. This promises to be the most prosperous season Junction has seen for years.—*Trinity Journal*.

WADSWORTH MINING MATTERS.—The annual meeting of the Black Warrior, Gold and Silver Mining company, was held at the Company's office at Wadsworth on Monday evening, February 25th. The following Trustees were elected to serve for twelve months: Jacob Zeck, Frank Free, Gustave Weissig, Frank Bricker, and J. B. Watson. Jacob Zeck was unanimously elected President of the company. At a meeting of the Trustees held the same evening, A. Moger was elected Secretary, Frank Free, Treasurer, and Frank Bricker, Superintendent. The company intended working their claim immediately, their ledge at present being at present about three feet in width, and a good quality of milling ore. Several new claims have been located in the vicinity of the Black Warrior mine during the past month, and a mining district organized. This new district being only about eighteen miles from Wadsworth, in Washoe county, we trust it may prove all that its friends claim for it.—*Nevada State Journal*.

PROSPECTING.—We are informed that Wm. Hanley, an old resident of Allegheny, has organized a company in San Francisco with a capital of about half a million for the purpose of prospecting the ridge below Allegheny. The company has already commenced work at Rapp's Ravine, some four miles below Allegheny. They are running into the ridge between Forest City and Allegheny, under which has been found some of the best paying ground in the State. There is a vast stretch of unprospected ridge below Forest City that gives every indication of having good pay under it. Where the ridge flattens out above Pike City, there have been good diggings for years. The whole country in that vicinity would, indeed, pay well if water could be had to work it.—*Mountain Messenger*.

SONOMA MINES.—A correspondent of the *Chronicle*, writing from Calistoga, under date of March 2d, gives some information regarding the quicksilver mines of Sonoma county. He says: The Sonoma mine, about two miles from Pine Flat, employs thirty men and has a ten-ton furnace. This mine is taking out a large amount of silver. The Rattlesnake mine, two miles further on, is, according to the opinion of some, destined to be the richest mine in the State. There is, however, some doubt regarding the extent of the lead. Passing on two miles further, we come to the famous Mission mine, owned by San Francisco capitalists. The ore from this mine, taken from a tunnel only seventy-five feet from the surface, yields 14½ per cent, there having been taken out 21 flasks in 13 days with two small retorts. Below this mine is the Kentucky, recently purchased by the San Francisco Contract company, and which will be put in running order as soon as the weather will permit. A four-stamp mill is to be erected at the Calistoga Gold and Silver mine, situated on Mount St. Helena. A large force of men are employed taking out ore.

The entire production of quicksilver of all the mines of Napa and Lake, including the Redington, is estimated to be about 1,200 flasks per month, the product of the latter alone reaching 500 flasks.

PATENTS & INVENTIONS

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Mar. 10, 1874.

For WEEK ENDING Feb. 24, 1874.

COAL SCREEN AND CHUTE.—James Flanagan, S. F., Cal.

WASH BOILER ATTACHMENT.—David J. Phillips, Stockton, Cal.

BRO.—Wallace Shattuck, S. F., Cal.

PAINTERS' CHASES.—John F. Uhlhorn, Sacramento, Cal.

DEVICE FOR BUAINING HYDRO-CARBONS.—Geo. W. Rindell, Lima, Peru.

CAR COTTLINO.—Abraham Ruet, Vaca, Cal.

QUININO CAR.—James M. Thompson, S. F., Cal.

APPARATUS FOR CONDENSING VOLATILE METALLIC SUBSTANCES.—Ferdinand Fiedler, New Almaden, Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

SAN JUAN.—We stated in a late issue that there had been trouble with Indians on the route to the Salt Lake mine. A correspondent of the Salt Lake Tribune makes the following extract from a private letter, written by H. B. Ferguson, dated at the San Juan mine, Jan. 21st, which gives a discouraging view of affairs there. "The San Juan country is a humbug. There are no gold ledges here of any size, and as for surface diggings, they are out of the question, the very best being from two to four dollar diggings. My advice to all is, not to come here. Cottonwood is nowhere, as far as snow is concerned. After leaving Salt Lake, we (a party of four) traveled south 350 miles, and then took a southeasterly course 150 miles, until we came to the present home of John D. Lee. We then traveled northerly and were joined by two men from Bristol, Nev. Reaching DeChille Valley, 80 miles from Lee's, we were attacked by Indians, and two of us, Charles Martin of Bingham Cañon, and George McClaren of Bristol, Nev., instantly killed. I received two wounds, one through my left arm and another through my thigh, the rest succeeded in escaping unhurt, except a man by the name of Fink, from Bingham Cañon, who is lying here badly wounded. There has been quite a number of men that crossed the Colorado river, bound for San Juan, who have never been heard from."

The Santa Rosa Democrat says that Eugene Light has invented a grain sower which he attaches to an ordinary gang plow. The machine is complete and perfect; it plows, sows and harrows the ground at one operation. It will put in from three and a half to four acres a day, and do the work well. The motive power is four horses.

PLACER diggings have been discovered at Santa Maria valley, San Diego County.

CAST STEEL SHOE AND DIE COMPANY,

OFFICE—Room 28, Hayward's Building, 419 California St., S. F.
Patented CAST STEEL SHOES & DIES for Quartz Mills.
Price, 20 cents per Pound.

SHAREHOLDERS, TRUSTEES, AND SECRETARIES OF ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

THE MINING AND SCIENTIFIC PRESS has closed its twenty-seventh volume, and the fourteenth year of its existence. The Press is a most valuable incentive to enterprise, inasmuch as it sets forth weekly the hidden resources, adventures, mining, scientific, mechanical, etc., of the Pacific States and Territories, besides a large amount of valuable reading matter. As the paper is a specialty in its line it should be read for reference by every subscriber.—Tuolumne Independent.

A New Yorker has now succeeded in making machinery which prepares the fiber in a highly acceptable condition for manufacturing. He is now negotiating with our largest planter on Twitchell Island to greatly increase the production. To insure a continuous market, he offers to take all that can be produced, at a price that will pay the contractor \$300 per acre. We want varied crops in California, and our farmers should inquire into this matter. The same must be moist land; especially after the first cutting, water is needed to insure a second growth. The uses of ramie are almost solely for interweaving with silk and wool. It makes a glossy cloth, and it takes all dyes. It weaves well. But it being of the nature of linen, the market offers no inducement to make cloth of that textile alone.—Bulletin.

THE RAMIE PLANT.—The farmers have now assurance of unlimited market for ramie. There has been no profit in its cultivation, because there was no machinery to prepare the fiber for the English market. It requires to be prepared when greasy, and therefore it cannot be sent abroad, where there is machinery. Twenty-six acres of ramie on Twitchell Island, yielded, in 1873, two cuttings, of sixty-five tons each, of green stock to the acre. Near Hayward, the same result was obtained; so that its successful cultivation is proved.

1840. 1874.

PAIN-KILLER, THE GREAT FAMILY MEDICINE OF THE AGE.

TAKEN INTERNALLY, IT CURES Dysentery, Cholera, Diarrhea, Cramp and Pain in the Stomach, Bowel Complaints, Painters' Colic, Liver Complaint, Dyspepsia, Indigestion, Sore Throat, Sudden Colds, Coughs, &c., &c.

Used Externally, it Cures Boils, Felons, Cuts, Bruises, Burns, Scalds, Old Sores, Sprains, Toothache, Pain in the Face, Neuralgia, Rheumatism, Frosted Feet, &c., &c., &c.

PAIN-KILLER, After a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is that its sales have constantly increased and wholly upon its own merits. The effect of the

Pain-Killer Upon the patient when taken internally. In case of Cold, Cough, Bowel Complaint, Cholera, Dysentery and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

The Pain-Killer Derives much of its popularity from the simplicity attending its use, which gives it a peculiar value in a family. The various diseases which may be reached by it, and in their incipient stages eradicate, are among those which are peculiarly fatal if suffered to run; but the curative magic of this preparation at once disarms them of their terrors. In all respects it fulfills the conditions of a popular medicine. Be sure you call for and get the genuine Pain-Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine. Directions accompany each bottle.

Price 25 cts., 50 cts., and \$1 per Bottle. Sold by all Medicine Dealers.

Black Mountain Coal Mining Company.—Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California. Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,

Or R. R. & J. CRAIG,

Room 6, 240 Montgomery St., S. F.

WILLIAMSON & CORY, Marysville.

Dutch Flat, August 10, 1873.

—AND—
Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Ores and Grammes, will be sent free upon application.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the greatest number built in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.

Of all sizes and in any quantity, furnished to order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work repasted.

MILLS.

Nos. 413 & 415 Mission st., bet. First & Fremont, S. F.

Ours is the OLDEST, LARGEST and MOST EXTENSIVELY KNOWN establishment of this kind on the Coast.

Our mills are under the direct supervision of one of the most experienced Samplers and Millmen in the country, and we purpose carrying on the business upon a scale commensurate with the wants of the mining public.

We have the best facilities for Crushing, Sampling and Pulverizing all classes of Gold, Silver, Copper and Lead Ores and other minerals.

We also crush and pulverize all kinds of Marble, Fire-Clay, Bricks, Coke, Cement, etc., upon the shortest notice, for which we have special mills.

Reliable information furnished to miners and ore dealers concerning shipments, freights, prices, etc. Prompt execution of all orders. Faithful attention to business entrusted to us.

Abundant storage room without extra charge.

Morris' Settler and Amalgamator.

An important improvement in milling. Cheap, light, efficient and durable. Gains Quicksilver on working tailings. Is discharged from the surface in the center instead of the side, by means of a Siphon which extends to near the center of the Settler. Heaviest casting weighs only 135 pounds. The eldse and bottom of the Settler are made of wood, as also Mullers, placed vertically—the friction of which brightens the quicksilver. One of these machines is in daily operation at No. 616 Merchant street, (basement), San Francisco. Parties desiring information as to rights of use, purchase, etc., can address,

PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Office, 606 Montgomery street, Room 16, - - - San Francisco.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East and this Coast for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature. The timber used is placed so directly in the line of strain, that less material is required to support the same load. It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN. Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition. Smith's celebrated OAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

SAN FRANCISCO, SATURDAY, MARCH 21, 1874.

VOLUME XXVIII
Number 12.

The Banner Mines, Idaho.

Banner District, Idaho, is about 28 miles east of Idaho city. The district is a new one, although some work was done on the ledges in the district eight or nine years ago; but they remained undeveloped, as there was no mill in the neighborhood. Work was started up there lately, and the Wolverine mine, particularly, is being thoroughly prospected. They have run a tunnel in 339 feet through the solid rock, and struck the ledge with very fair ore, five feet in width. A shaft, already sunk, is 75 feet in depth, and the tunnel will connect with it. Mr. G. W. Crafts, at present in this city, is now building a 20-stamp mill in the district, which will be furnished with roasting furnaces, pans, etc. Mr. Crafts informs us that it will probably be completed in August. Mr. Crafts is owner of the Wolverine mine, above referred to, and is building the mill to crush ores from that mine. He will, however, be prepared to work small lots of ore for other miners in the district.

The ores in this district assay all the way from \$40 to \$900 per ton, varying from \$18 to \$40 in gold, and the balance in silver. The country in the vicinity is almost entirely unprospected, though there are many other ledges taken up, but not developed to any extent. The district is on the belt of quartz running to Atlanta district, Alturas county, about 50 miles distant. Several locations have been made on this belt.

The facilities for wood and water in the district are excellent. There is plenty of water for steam purposes. A road was completed last year out through the mines. There is no settlement or town in the district as yet but Mr. Crafts informs us that there will be several hundred men there this spring. It is a fine healthy country, with some snow, but no winds. Grass is plenty all summer. There are placer mines within six miles of there now being worked by Chinamen. This part of Idaho Territory has heretofore been neglected but some considerable attention is now being called to it and the erection of the mill in this district will do much to develop the mines. The quartz interests in all that vicinity are now looking up. A new mill is now being erected near Idaho city, and some ore of good quality has been lately struck on Summit Flat near by. There is room for a good deal of prospecting in that part of Idaho; and, if the new mills are successful, it will doubtless cause many new mines to be opened.

WHEELER'S SURVEY.—The expedition for the geographical and geological surveys west of the 100th meridian, of which the parties under charge of Lieutenant George M. Wheeler, of the Corps of Engineers, has been in the field for the years 1869, 1871 and 1873, will, as soon as final action is taken by Congress, resume their field of operations in the spring in portions of Colorado territory. One party will be designated to prosecute the service over the unfinished parts, and over the area represented by their atlas sheet, No. 61, which is situated between parallels 39° and 37°, 10° and 105°, 30° and 315°, 15° longitude west from Greenwich. This is especially the section where there are manifold forms embracing portions of the headwaters of the San Juan and its northern tributaries; also of the Gunnison and Green rivers, where there are several prominent mountain ranges, among them the Sierra Lelata, Sierra San Miguel and Elk mountains. It is a part of the most elevated portion of the interior of the continent. Many are being attracted toward this section in search of precious minerals, and large numbers of miners are seeking the San Juan district, which vicinity promises a large and interesting field. Their work upon the Astronomical Survey will be resumed, and such astronomical parties as the appropriation will allow will be put into the field. From the remaining balance other field parties will soon be organized. In view of the amount available, they will take the field prior to the first of July.

CAPITAL IN UTAH.—It is stated that nearly half a million of dollars have been brought to Salt Lake city, within the past thirty days, for investment in mining property.

Purification of Quicksilver.

Mill men and miners all know that dirty quicksilver is not so good to work with as that

Improved Force and Lift Pump.

that is clean. In practical work in mills and hydraulic claims, or in investigations carried on in physical laboratories, and in the volum-

tube was partly filled with dilute nitric acid, and was provided with a stop cock below, or with a bent tube, so that a short column of mercury might balance a long column of acid.

The device recommended in the *Scientific American* by Prof. Leids, of the Stevens Institute of Technology, consists of a glass funnel, A, (see cut), capable of holding five or ten pounds of mercury, the tube of which is cut off at a point just below the stopper of the bottle, B. Cotton wool is jammed into the tube until it fills up the neck, and bulges out at the bottom of the funnel. A short glass tube bent at right angles passes likewise through the india rubber stopper of the bottle, and is connected with a water air-pump. The bottle is two-thirds filled with dilute nitric acid (one part of acid and four or five parts of water). The impure mercury poured into the funnel, A, is drawn through the cotton plug in a multitude of streams, and passes as a fine rain through the acid below. The foreign metals, if not in too large quantities, are removed by solution in the acid, and the pure mercury collects below. It is then run off through the stop cock into a second funnel, C; and, after being thoroughly dried by suction through another plug of cotton wool, it is caught and preserved in the bottle, D. A short time suffices for the almost automatic purification of a large quantity of mercury.

Delaney's Improved Pump.

Edward J. Delaney of San Jose, Santa Clara county, has recently received through the Scientific Press Patent Agency, a patent for a lift and force-pump, which possesses some peculiar improvements, worthy of note. It consists in a novel arrangement of a hollow plunger, which operates within the outer case and air chamber, and fits closely around the

APPARATUS FOR PURIFYING QUICKSILVER.

etric analysis of gases, a large quantity of mercury is employed. And as it is very readily contaminated, a method for its rapid and convenient purification is important. Such a method must provide for the removal of the three kinds of impurities which are usually present: First, foreign metals, especially lead, zinc, and tin; secondly, common dirt and dust; and thirdly, water or other liquids.

The most convenient device hitherto employed was a long glass tube, into which the mercury was poured through a paper funnel, the funnel having a pin hole at the bottom, and serving to retain the dirt and dust. The

induction pipe. In connection with this plunger is a peculiar arrangement of the valve, and a ring for holding the packing. By referring to the accompanying cut, the method of operation will be seen.

A is the air-chamber, having a proper stuffing-box at the top through which the piston-rod works. The air chamber is attached to a hollow stand secured to a base plate in the ordinary way. The induction pipe, C, is made to fit closely where it passes through this base plate, and its upper part is somewhat larger than the lower. This part is made smooth and has grooves, I, made around it, which serve to hold

the water for packing purposes. The plunger, B, is a hollow cylinder, and fits closely over the upper part of the induction pipe, C, the water between the two in the grooves, F, serving to make it work tight. The induction valve, D, is fitted to rise and fall within the induction pipe, C, near the top, being supported upon the seat, and guarded by snitable arms. At the top of the induction pipe, C, a ring is screwed on as the cut shows. This ring has a flange which nearly fills the inside diameter of plunger. The pipe, C, is turned somewhat smaller outside just below its top, and this space allows a packing to be used and held in place by the ring.

The discharge valve, E, is conical in shape, and fits around the piston as shown, a collar just above it preventing too great a lift. The operation is as follows: The plunger, B, being drawn up, the valve, E, remains closed, and a vacuum is produced within the plunger, which causes the valve, D, to open and allow the space to fill with water. When the plunger, B, is again depressed, the water will close the lower valve and open the upper one, whence the water escapes into the air chamber, A, and out of the discharge pipe I.

Legislative Report—State University.

The Committee on Education, A. Higbie, Chairman, has made a report, giving a detailed statement of their visit to the State University, to the Deaf, Dumb and Blind Institution, and to the Normal School at San Jose. The Committee expresses itself as much pleased with the appearance of the new site and grounds of the University, the buildings erected, the class rooms, etc. They also report that the Professors appear to have been faithful in the discharge of their duties.

They recommend that snitable buildings should be erected at Berkeley for the accommodation of the Professors, with their families, and such of the students as choose to remain permanently near the University. The present necessity for spending the day at the University and the night at Oakland, five miles away, is both inconvenient and expensive. In addition to these improvements it is considered very important that arrangements should be made at an early day for practical operations in farming, which would involve the erection of snitable farm buildings, the provision of teams, implements, tools, etc.

The committee say that "the time has come when the farmer and mechanic, and their sons must have equal opportunities, and be as thoroughly educated in their honorable and responsible calling as the lawyer, the physician or the clergyman in their professions." "These facts," adds the Committee, "are realized in Europe."

The Committee appears to differ from the opinion expressed by President Gilman, in his late address before the Legislature, that the Agricultural Colleges in the various States have come about of what should be considered a success. They say:—"We think we are warranted in saying that these colleges may be regarded, everything considered, not only a gratifying success, but as a means of lessening the distance in the educational work between the high and low, the richer and the poorer classes of the community."

The report favors the suggestion contained in the memorial of the Patrons of Husbandry, that the Board of Regents should more fully represent the entire State, by being selected from its different sections, etc.

The Committee hold that the Professor of Agriculture, especially, should have his residence upon the University grounds, and be supplied with the means for imparting practical instruction in the field. They say that those who had authority have "failed to carry into effect propositions made two or three years ago, by which the Professor of Agriculture might carry out this plan," which the Committee think would have been of great advantage to the University. The Committee, however, expressly disavow attaching any fault in the matter to any one connected with the management of the general affairs of the University. "Nobody to blame," of course.

Reese river now empties into the Humboldt for the first time in years.

MECHANICAL PROGRESS.

A New Railroad Snow-Plow.

In view of the rough times experienced along the line of the railroad recently, the following description of a novel snow-plow, from the *New York News*, will be found interesting:

For years the genius of railroad men has been exercised in trying to invent some method of overcoming the accumulated snows that seriously impede travel, and even bring the iron horse with its attendant train to a state of fixity, forbidding either advance or retreat; but heretofore every device has proved futile against the great barriers that are piled up over the track, sometimes in a few hours. At length, however, a device has been invented which it is thought will overcome the most formidable obstacle of this sort—that will easily and entirely vanquish the enemy, and make traveling by railroad as safe and facile in the winter as in any other season of the year.

Mr. Benjamin W. Hitchcock whose name has been familiar in connection with suburban improvements, while seated in his real estate office opposite the railroad depot at West Flushing during a snow-storm in the early part of last winter, observing the plank covered snow-catcher (the usual contrivance for shoving snow aside) on a train just passing, conceived the idea of elevating the snow and casting it aside by means of belts and pulleys with the assistance of shears and chutes, instead of the awkward but common method of "bucking" and forcing it away from before the train by main strength and stupidity. About the same time the newspapers published accounts of the frightful sufferings of several hundred men employed in constructing the new Pacific railroad, who had been "snowed in" at a point in Minnesota, one hundred miles from any settlement, entirely without food or any adequate means of protection against the extraordinary rigor of winter, and of the great exertions made for their rescue which was fortunately accomplished by the most arduous labor. The terrible experience of these poor fellows, wrought in Mr. Hitchcock a determination to test the efficacy of a plan he had conceived for opening a path through the deepest snows and clearing the track, by building a machine and putting it into practical use, feeling confident that in any case similar to that in Minnesota, life might be saved and uninterrupted travel secured by the invention. He accordingly employed a firm of machinists in this city to build a model after his plans. This model was completed, with such slight improvements on the original design, as suggested themselves as the work advanced.

The platform car upon which the structure is built is thirty feet in length. In advance is placed a frame twelve feet in length, elevated at an angle of forty-five degrees, and the top of which is about on a line with the front of the car. At the bottom of this frame is an iron plate and nose for breaking up and receiving the snow, which is caught up by iron huckets, four feet wide and eight inches high, attached to endless belts of rubber or canvas of immense strength, which revolve on cylinders of oak and iron, and thus carry their burden of snow to the tops of the frame and throw it upon the roof of the house covering the engines and part of the boiler, the other part of the boiler being covered by a still higher flat roof like the ordinary roof of a baggage car, excepting that it has a tower for a look-out and signal station, with glass sashes, some two feet higher than the roof.

When the snow is thrown upon the roof of the engine-house, which may be made with the pitch to one side, or both, as may be desired, large sliding shears give it direction, and the sloping roof assists its deposit away from the track on the side of the road. The roof and shears are covered with sheets of heavy zinc to afford a slippery surface. The present machine is built to discharge the snow on both sides of the track, at an elevation of six and a half feet, the railroad having but a single track. The motive power consists of a team of two ten-horse-power oscillating engines, with a twenty-five horse-power boiler—the engines driving the two upper cylinders upon which the belts revolve, by cog-wheels of great strength. The Snow Plow is intended to be used in advance of a locomotive, being pushed ahead to its work, and having its own machinery and power without depending upon either steam or force from the locomotive to do its track clearing.

GAS ENGINES.—Mr. Baher, British Inspector of Factories, mentions in his report, recently issued, that gas engines are coming into use in various trades, particularly for small letter-press printers and riband weavers. It is a cheap and easily applied motive power, whenever a solid foundation for the engine can be obtained. In the neighborhood of Coventry, he observes, steam power forming a considerable element of expense in the weaving of ribands, the gas engine has been applied to do the work of boys of thirteen or fourteen years of age, who used to turn the machinery, and the invention is acceptable as relieving labor of some part of its fatigue.

HEAVY.—Krupp's last big gun is 21 feet long, and throws a ball of 600 pounds, with a charge of 120 pounds of powder, and the last great ingot of steel forged under his 120,000 pound steam hammer, weighs 105,000 pounds.

Telodynamic Transmission of Power.

At the Paris Universal Exposition, the transmission of power by wire ropes, or telodynamic cables, as exhibited by M. Hirn, attracted great attention. This gentleman was among the first to distinctly enunciate the general principle upon which the economical transmission of power in this way could be secured, namely, the use of very light cables and wheels of large diameter, thus transmitting the power with high velocity, low tension on the cable, and the least amount of friction. The use of this method of transmission may be said to date in this country from the Paris Exposition; and, although the system has been adopted to a considerable extent in this country, it does not seem to have attained that extended application to which its merits entitle it.

According to Professor Barnard's report, the system of M. Hirn was successfully applied to the transmission of power through a distance of over three miles. It was M. Hirn's opinion that one hundred horse-power could be carried six miles without more than twenty-five per cent. of loss; and, although this estimate of loss is undoubtedly much below the mark, we know of no other system by which power could be transmitted to the same distance with greater economy. Compressed air passing through a pipe that length would, in ordinary practice, undoubtedly lose as much, through the loss of heat during the transmission, the friction of the air column on the walls of the pipe, and the friction of the engine at the terminus. Besides, the telodynamic system has a great advantage over any other, in point of first cost. According to M. Hirn, the pulleys need not be more frequent than once in two hundred and fifty feet. This being the case, power could be transmitted through a distance of one thousand yards by the use of two terminal pulleys, and two sets of intermediate carrying pulleys. The only cost, therefore, would be for these pulleys and their supports, and the cable by which the transmission is effected. While we do not doubt the practicability of transmitting power through very long cables, like those mentioned above, the difficulties undoubtedly increase in a larger ratio than the distances. The experiments made of propelling cars by cable on the elevated railway, running on the western side of this city, was a decided failure. Much of the difficulty in this case, however, arose from the necessity of stopping and starting cars. If continuous motion had been required, or if the starting and stopping could have been effected very slowly, it is probable the cable would have worked better. It was necessary, however, to attach the cars to the cable by a gripping apparatus, while the former was in motion, thus putting very sudden and great tension upon the rope and strain upon the machinery. Our own observations of the system of transmission of power by wire ropes, has satisfied us that for distances within from three to four thousand feet, it may be made the most economical, not only in first cost, but in cost of current repairs, of any system now known, while, at the same time, we believe it will compare favorably with any other system, when considered with reference to the percentage of the power of the prime motor it can transmit.—*Artsman*.

DESTRUCTIVE INGENUITY.—What may be termed a remarkable instance of destructive ingenuity is the new German infantry rifle, for metal cartridges, of an entirely new pattern and peculiar construction. The lock is an improved needle-lock arranged for self-cocking, and combining the simplicity and solidity of the needle system with quick and convenient loading, and with a rapidity of firing equal to the best rifles now in use. There are six parts to the lock, and the loading requires only three movements, namely, the opening of the chamber, by which operation the lock is cocked at the same time—throwing in one of the cartridges into its bed, it not being necessary to put it in exactly—and the closing of the chamber. The gun is now ready for firing. The empty cartridge is ejected at the next opening by means of an extractor fixed at the movable round of the chamber. The maximum number of shots per minute is twenty-four. The gun is constructed for ignition by pin or needle, as an exhibited chamber-round with screwed-in needle shows; the latter has only to be substituted for the chamber-round with pin, when a change is desired.—*Eng.*

INTERESTING TO INVENTORS.—The Council of the Society for the Promotion of Scientific Industry, in London, looking to the enormous waste there is in the consumption of coal, while its cost is every day increasing, have resolved that an exhibition shall be held in Manchester, of all appliances and apparatus that tend to the economic use and saving of fuel, for the purpose of inducing attention to, and eliciting opinions of practical men on the matter, and of giving all consumers of coal an opportunity of comparing the various appliances, with a view to their adoption of that which will best serve their purpose. The exhibition will comprise: 1st. Appliances which may be adapted to existing furnaces, etc., whereby an actual saving is effected in the consumption of fuel. 2d. Appliances which may be adapted to existing furnaces, etc., whereby waste heat is utilized. 3d. New steam generators and furnaces, boilers and engines specially adapted for the saving of fuel, appliances whereby waste products are utilized, and the radiation of heat prevented.—*N. S. Chronicle*.

SCIENTIFIC PROGRESS.

Spontaneous Generation.

All experiments thus far made with infusions of different substances, for the purpose of producing infusorial animalcules, appeared to prove that the access of air was necessary for their formation. Pasteur, who has extensively occupied himself with these investigations, found at last that the germs of these animalcules could, under certain circumstances, resist a temperature of 212° Fahr., as he obtained bacteria from solutions which had been previously boiled and afterward came only in contact with air which had been dried and purified by passing it through red hot pumice stone.

However, in 1869, Dr. H. Charlton Bastian took the matter up, and commenced trying if he could not produce animal life in a vacuum. He experimented with various fluids, especially infusions of hay and turnips; he placed them in one ounce flasks, having narrow drawn-out necks, and heated the solutions in them rapidly till they commenced to boil over, so as to be sure that all air was expelled; then he kept them boiling from a quarter to half an hour, while the steam was escaping with some force; then the neck was sealed up by melting the glass with a blow-pipe flame, while at the same time the heat was withdrawn. In this way he produced after some practice a perfect vacuum, that is to say, one where air was excluded, and only watery vapor present. The proof of this was that the water hammer effect was quite obvious; this means that the water could be made to fall with a shock from one end of the tube to the other, without passing an atmospheric bubble, as is the case when air is present. When the little flasks were thus prepared, they showed the development of bacteria and other minute moving organisms just as well as if they had not been submitted to great heat, and air had access. The time required for this phenomenon varied from a few hours to several days.

Even when the flasks, after being closed, were submitted for several hours to boiling water, the organisms appeared; and Dr. Bastian went even so far as to submit them for four hours to a temperature of 300°, and about 6° in excess, without preventing the subsequent development of the animalcules. He reasoned, then, as follows: As the germs cannot come from the air and pass through the glass, only one of two conclusions is admissible. 1. That the invisible germs of the animalcules are able to stand the heat of 306° without being killed; or (2) that living things can be evolved from non-living matter.

The first conclusion is that of Pasteur, and is based on the assumption of the old maxim *omne vivum ex ovo* (all life comes from an egg), deduced from the fact that it is known to be true for all the higher animals and plants, and that its extension to the lower forms of life, which are intermediate between animal and vegetable, is supposed to be a legitimate deduction on the ground of natural law.

The second conclusion is that defended by Dr. Bastian; he maintains that the doctrine of evolution, now established by an overwhelming weight of evidence, absolutely requires that living matter must at some time have arisen from that which was not living, and that, in absence of any reason to the contrary, the uniformity of natural law should lead us to believe that the process continues to take place. He says that all analogy is against the possibility of the assumed germs retaining their life after being subjected to a heat of over 300°. No living being that we know of can endure the heat of boiling water, 212°, except a few seeds of the higher plants, which are protected by a very hard and non-conducting coat. Most animals and plants, indeed, perish at a much lower temperature. With regard to the bacteria themselves, they are mere specks of naked protoplasm; they are utterly destroyed at 140°, as sufficiently proved by the numerous experiments made by Pasteur, Bastian, and others. It is unlikely, therefore, that they should have germs capable of enduring 306°.

Experiments were also made by Dr. Bastian with fluids capable, after being boiled, of nourishing bacteria when any were put into them, and of supporting their copious reproduction, though not evolving them anew, when enclosed in hermetically sealed vessels. The uniform result was that 140° not only kills all living bacteria, but also prevents the further development or reproduction of any germ which might be supposed to exist. The natural conclusion is that they do not exist, and therefore these experiments exploded the germ theory.

We hope that these investigations will continue so as to obtain uniform results; as only then can a full discussion of the possible explanations ensue. In the meantime, Dr. Bastian's experiments are drawing the attention of the most eminent philosophical naturalists. For instance, Alfred R. Wallace ranks Bastian's book as equal in value to Darwin's "Origin of Species," or Spencer's "Principles of Biology," especially in regard to "curious and novel facts," "new and astounding views of the origin of life," "excellent reasoning," and "acute criticisms."

There is, however, one point to which we wish to draw attention; it is the assumption

that these living organisms are evolved entirely from inorganic matter. This, we believe, is not strictly correct; the infusions all have organic origin; they are organic compounds, and it is well known that the organic compounds are not decomposed into their inorganic elements, except by actual combustion. Starch, sugar, gelatine, etc., are not destroyed, as such, by a temperature of 300°, therefore, if we attempt to generate living organisms from inorganic matter, we must not commence by using organic substances, but must confine ourselves to elements, or their simple inorganic chemical combinations.—*Scientific American*.

Circular Compass Needle.

M. E. Duchemer, addresses a note to the French Academy, in which he claims that a circular compass needle possesses the following advantages over the usual form:

1st. A magnetic power, for a given diameter, double that of a needle whose length is equal to this diameter.

2d. The existence of two neutral points instead of one, which has the effect of maintaining the position of the two poles constant; the magnetism seems to be so energetically preserved, that even the strongest sparks of a Holtz machine do not cause any displacement of the poles of the magnet.

3d. A more satisfactory means of suspending the magnet, when it is well mounted and balanced by a plate of agate; it seems then to move as if placed in a liquid.

4th. An increase in sensibility of the magnet proportioned to its diameter.

5th. The possibility of neutralizing the magnetism of the vessel by means of a second magnetic circle, changing the position by an amount calculated beforehand, and thus permitting the compensation of the compass before the sailing of the vessel. This idea was suggested by Capt. D. Venie.

NEW THEORY ABOUT COMETS.—At a recent meeting of the Lawrence, Kansas, Academy of Science, a paper entitled "Speculations on the Nature of Comets' Tails" was read by Professor F. W. Bardwell, who took the ground that a comet's tail is no more a part of the comet than is a shadow a part of the object which gives it form. He supposes that the resisting medium surrounding the sun for a great distance is itself self-luminous in a degree, as indicated by the zodiacal light; that the nucleus of a comet is merely a large meteorite; that in its rapid motion through the resisting medium near the sun, great heat is thereby developed, increased by the heat of the sun, causing some of the elements of the nucleus to become volatilized, and thus to present the phenomena of the coma with its glowing gas; and, finally, that the bright train called the tail is merely an effect of an increased luminosity of the portion of the resisting medium behind the comet, caused by the action of the sunlight and passed through the glowing gas of the coma, and projected beyond in a form usually approached that of a conical surface. He predicts that, on the appearance of a comet with a bright train, the tests of spectrum analysis will show that this train is not nebulous, as Bessel and others have supposed, and not of a meteoric character like that of the nucleus, as Schiaparelli and Le Verrier suppose; but chiefly of a zodiacal nature, and probably, in a slight degree, reflecting sunlight.

THE ACTION OF ACIDS UPON ZINC.—At the recent meeting of the French Association for the Advancement of Science, M. Gourdon, of Lyons, described some novel facts which he had observed in the action of acids upon zinc covered with certain metals. Zinc plunged into dilute solutions of sulphuric, hydrochloric and acetic acids, is attacked only at the points where other metals are present. The metals which produce this phenomenon with most intensity are cobalt, platinum, nickel and iron. Ammoniacal chloride of cobalt renders it possible to perforate zinc with water containing only one 10,000th part of sulphuric acid. M. Gourdon applies these results to various procedures for engraving. By writing directly upon zinc with different metallic inks, making use of the most active, containing salts of cobalt for the blackest parts, and passing it then into acidulated water, an engraved plate is obtained. To reproduce leaves or plants, they are soaked in solutions of metallic salts and applied to the zinc, which is then treated with weak acids. The author has discovered a new kind of heliographic engraving by transferring the silver from an ordinary photographic proof upon the zinc, which can be attacked by the acids on the parts where the silver has been deposited.

LIGHTS FOR VESSELS.—At a late meeting of the Manchester Scientific and Mechanical Society, a paper was read by Mr. J. Hacking. One means suggested was by supplying vessels with feelers, in the shape of long poles fixed to their bows, which should signal the approach of danger. His next proposal was that every vessel should carry an apparatus composed of some flexible or rigid material, to be in readiness to place over any leak. A discussion followed, in which considerable doubt was expressed as to the applicability of the plans proposed. Prof. Reynolds said there was some difficulty in the adoption of the first plan, but he thought the second might be of service. Mr. Moorsom was of opinion that neither proposal was feasible. What was wanted was better lights, and he thought the time was coming when the electric light would be generally used on board ships.—*Iron*.

CORRESPONDENCE.

American Fork District Utah.

Editors Press:—This district is south east of, and adjoins Little Cottonwood, is distant from Salt Lake city, about 45 miles via the Utah, Southern and American Fork Railroads, and 35 miles via Little Cottonwood.

In this district is found milling ore, but principally smelting ore, carbonates, sulphates and galena. The principal mine in this district is the Miller, the property of the

Miller Mining and Smelting Company.

Who also own the Sultana Smelting works, four miles east of the Miller, and situated in Forest city.

The principal shareholders of the Miller Mining and Smelting Company are General Lloyd, Aspinwall, and Mr. Howland, of New York. The ore is brought to the smelter by means of a tramway, which, after leaving the mine at a steep pitch, winds itself through Mary Ellen gulch, around the mountain side at a sufficient elevation to give it a good grade. The Miller mine is developed on the south side of the hill by the Mormon tunnel 700 feet long, the main tunnel, with incline and extension drift, more than 800 feet long; from this extension drift ran two inclines toward Mormon tunnel, and from the main tunnel a shaft 92 feet deep, down upon Howland tunnel, (a branch of the Mormon tunnel); the Alpine tunnel, 85 feet long; Lady Annie May tunnel, 50 feet long; Emilino tunnel, 187 feet; Last Hope tunnel, over 200 feet; Aspinwall shaft, 73 feet deep.

On the north side of Miller hill, the Lady Annie tunnel, 354 feet; Baskin tunnel, 25 feet. The Mormon tunnel struck ore at a length of 600 feet, the vein being 3, and at some places 5 feet wide. This ore contained 47 ounces silver and from 35 to 50 per cent. of galena, but was difficult to work on account of a great percentage of sulphates of iron. The vein lies between slate and limestone; 15 feet below the slate was the quartzite formation.

The Last Hope tunnel begun in September 1873, is run up to the present date, already 200 feet, so that the Miller mine has a very fair prospect for this year.

Between the Last Hope and Mormon tunnels lie all the other tunnels, which were working out and following principally pockets of carbonate ores. The smelting works consist of three cupolas, engines and blowers, and were built in 1871, shortly after the incorporation of the company.

The mine at present is under the superintendence of Mr. Epley, a California quartz miner.

The Wild Dutchman,

Close to the Sultana smelter, largely developed, is yielding a considerable amount of ore, of high grade. They have sold a considerable quantity to the Miller Co.

The London Tunnel Company

Are washing away with hydraulic on the opposite side of the hill, south from the Miller, for float, and have sold considerable to the Miller Co. The Mary Ellen and the Live Yankee have both fine prospects, with large quantities of ore in sight.

The Wyoming Company

Is developed by two tunnels and one shaft. It is rumored that the Miller Co., have bought this mine, which contains considerable good ore.

The Silver Gleaner

On the ridge opposite, south of the Miller, is developed by two tunnels. Fine and rich milling ore in sight. It is a very good mine.

The Roessler Mine,

West of the Miller, owned by Messrs. E. Roessler, W. Bredemeyer and Good, has a vein of galena, 2½ feet wide, assaying 67 ounces in silver and 54 per cent. in lead. The vein is a true fissure vein, formation, quartzite. On this mine is an incline 50 feet deep, and a drift of 30 feet, all upon the vein. The vein is traceable down the mountain for 1,200 feet.

The Caribou Mine

Is worked by a tunnel 36 feet long, and a shaft 35 feet deep, upon the vein. The vein is 3 feet wide. Their ore is galena intermingled with quartzite and sulphates of iron. It assays 140 ounces in silver, one-half ounce in gold and 35 per cent. lead. Its situation on the hill is such that a tunnel 150 feet long, would strike the vein again, having 1,000 feet of ore above.

The War Eagle,

Is developed by one tunnel and one shaft. It is on the same vein as the Caribou, and is owned by Hirschman Brothers of Salt Lake city.

The Pillsburg

Is largely developed; ore in great quantity, but low grade. Mr. Kennedy is superintendent.

The Queen of the West.

Is opposite the Caribou. Vein 3 to 5 feet wide; ore galena; percentage, 47 ounces silver, 70 per cent. lead, formation, quartzite. Developed by tunnel 200 feet long, and a shaft upon the vein.

The Moavogue and Bredemeyer No 2.

Is as yet little developed. Vein galena, 2½ feet wide. Assay 47 ounces silver, and 35 per cent in lead. Owners, E. L. Moavogue and D. Bredemeyer.

American Fork district has numerous other mines, but little developed. There is plenty of water, fuel and good roads all around. This district will produce this year a great quantity of ore, and will certainly draw public attention towards it. It is certainly worth the notice of capitalists.

W. BREDEMAYER.

Utilization of Pyrites Residue.

The process invented by Mr. Gibbs for the utilization of pyrites residue after the manufacture of sulphuric acid has been well described by Mr. Ch. Mene in an interesting communication to *La Houille*. The pyrites treated, chiefly those of Spain, generally contain copper worth extracting. The residue, which still contains, perhaps 4 per cent. of sulphur, is mixed with fresh pyrites, so as to raise the contents of sulphur to about 5 per cent.; 7 per cent. of rock salt is then added, and the mass having been mixed, is roasted for 12 hours at scarcely a dull-red heat. This is done in a reverberatory furnace, the sole of which is formed by a turn-table. The sulphur under the influence of the oxygen charges the chloride of sodium into sulphate of sodium. In treating the mass by water, sulphate of soda and chloride of copper go into solution, and the insoluble residue consists almost entirely of oxide of iron, which is sold to the ironmasters, and turned to account by them. There remains to be extracted from the solution the soda and the copper, and these two processes are made by Mr. Gibbs, to work into each other. Firstly, the copper is thrown down as sulphate by sulphuretted hydrogen, and the precipitate is converted into a coppery matte (On2S) in a reverberatory furnace; the matte is subsequently roasted, and then refined into a malleable and very pure copper. Besides the copper, the pyrites usually contains a little silver. To extract it, the first portion of the precipitate (that containing the first 5 per cent. of the whole of the copper, determined by analysis) is set aside. This precipitate contains all the silver which is extracted, and sold as chloride of silver.

Returning to the treatment of the sulphate of soda, which was mixed with the chloride of soda in the first solution, the object is, on the one hand, to transform it into carbonate of soda which is salable; and, on the other, to recover the sulphuretted hydrogen which has been used for the separation of the copper. The solution whence the copper has been precipitated is evaporated. The sulphate of soda is then mixed with coal, and the mixture in the reducing flame of a reverberatory furnace; with ½ ton of sulphate, the operation lasting three hours. Sulphide of sodium is thus obtained, and is dissolved out with warm water, in a closed vessel to avoid the introduction of air. Into this solution (the strength of the solution is such that it will give one-fourth or one-fifth of its weight in salt of soda) a current of carbonic acid is introduced, the sulphuretted hydrogen is disengaged, and goes to precipitate the copper, as has just been explained, and the soda passes into the state of salt of soda after the evaporation of the solution.

The carbonic acid is produced by means of two cupolas, one containing coke and other carbonate of lime. In the first a current of air passing through gives carbonic oxide, and in the second this carbonic oxide, by suitable admission of air, burns, and gives carbonic acid from the decomposition of the carbonate of lime. The sulphuretted hydrogen disengaged is entirely absorbed, for it will not precipitate quite all the copper, the last portions have to be separated by the addition of a little scrap-iron. The process is interesting, as showing that when scientific processes are suitably applied they often become industrial, practical, and lucrative.

THE OLD TRUCKEE DISTRICT.—W. F. Osborn, who was Recorder of Truckee Mining District at the time that the leads in that region were first located, arrived here two or three days since from California, and is making arrangements with some of the old-time owners of the mines formerly worked to resume operations on them early this spring. All the leads are rich in argentiferous galena, the assays from several of them averaging from \$200 to \$350, and it is thought that they can now be made to pay well for working, so great are the advances that have been made by our people in the art of smelting ores. At the time the mines of Truckee District were first opened there were no furnaces in operation in the country, and there being no demand for ores that required to be smelted the original owners of the mines (all poor men) were forced to abandon them. The district lies to the east of Reno, in the direction of Pyramid Lake.—*Enterprise*.

"IS THERE COAL IN THE SAGEBRUSH?"—From a specimen shown us last evening by Frank Wittenberg we should say there was a good prospect for coal. Messrs. Wittenberg, Mendes & Co., have just made a valuable discovery. They have discovered an extensive bed of coal, the locality of which is within forty miles of Eureka. The exact place will not be made known for a few days as the surveys are not yet completed. The vein as far as developed is about four feet thick, but the indications are that it will become more extensive as depth is attained.—*Eureka Sentinel*.

PROSPECTING—that great work which adds so much to the wealth and prosperity of the country—will be more vigorously prosecuted during the coming summer than for years past, throughout the coast.

Lake County Mines, Colorado.

In Lake county there has been some ten or twelve lodes found in the vicinity of Iowaglnch the ore from which assays from 150 up to 200 ounces per ton in silver, and from thirty to forty per cent. lead. The crevices are very large, some of them in limestone and some in gneiss wall-rock.

At the head of Evans gulch, there has been some eight paying lodes found in granite wall-rock, which can turn out about eight tons per day of ore that will pay 150 ounces per ton in silver, and twenty per cent. lead, mill samples.

About Oro City there has been tea lodes opened, which are very rich in silver and gold, and as the ore also contains iron and lead, it cannot be treated at the stamp mills; so all the mines are laying idle waiting for some enterprising person to erect smelting works in that part of Colorado.

Nineteen miles from Oro City is located the Homestake mine owned by Messrs. Archer and McFadden of Denver. They are now working five men getting out ore, and four men driving a tunnel, which when completed, will be 234 feet long, and will cut the vein seventy-five feet below the first tunnel. The tunnel will reach the vein by August or September, 1874, and will give them all the ground they can stoop out in twenty years, including what they have from first tunnel.

The first tunnel is fifty feet long, and the mine is worked east and west from tunnel—300 feet on east level, and 275 feet on the west level, which gives fifty feet stopping ground to surface on east end, and on west end seventy-five feet. There is a railroad in the tunnel from east end to west end, and a tramway 600 feet long from tunnel to foot of mountain. The tramway is built on a trestling ten feet from the ground, so that snow storms cannot block it up and stop the work. Cars run into the mine, are filled, attached to a wire rope ¾ inch thick and let down the tramway while the empty cars come up. There is a good wagon road to the foot of the tramway.

There have been two drills at work on the mine, driving levels, five months in 1873; fifty-four tons of ore have been shipped to Denver, and there are about seventy-five tons on dump. The ore shipped to Denver is worth \$225 per ton. That on dump is worth \$100 per ton.

This is one of the best locations in Colorado for smelting works. There is no work of the kind in Lake county, and parties contemplating their erection, would do well to visit that part of the Territory, and see for themselves the many advantages offered by that section to encourage such an enterprise.—*Denver Tribune*.

The Morgan Mill.

The *News* has the following about the Morgan Mill, situated on the Carson River, a short distance east of Empire.

All of the machinery connected with the mill was in the completest order, and running like clock work. The engine-room was very clean. There was not a drop of grease to be seen on the floor, which was as white as that of a Shaker church. The engine was a beauty to behold. In the engineer we recognized our old-time friend, W. O. Broadhead, a very companionable gentleman. At the mill we saw in operation a pump involving the principle of the famous Archimedean screw. It stands at an angle of thirty degrees, and daily pumps up to the top of the building the refuse water from the settlers, together with about twenty tons of sand. Several years ago a gentleman applied for a patent for a pump of this description, but was chagrined to learn that the same kind of pump was in use on the banks of the Nile thousands of years ago.

Among the improvements recently made at the mill is an immense blauket flume, containing five sluices, each 600 feet in length, the superficies of the whole amounting to 3,600 feet. We had a very pleasant chat with the efficient foreman, A. J. Lockwood, to whom we were indebted for many courtesies.

SAN JUAN.—The *Washington Republican* says: The San Juan mining regions which are now attracting so much attention, are to receive the special attention of Professor Hayden, United States geologist, in his explorations during the coming season. * * * The mines are located near the "Park of Las Animas," and from the mountains flow many streams in a southerly direction, such as the Rio de la Plata, Rio de Las Animas, Rio Florida and many others. Flowing eastward, parallel with this range, is the great Rio Grande Del Norte, with most of its tributaries. All the streams mentioned have their sources not very distant from the mines, and each stream flows through a valley capable of sustaining a large agricultural community, thus making the entire region self-sustaining, both in mining and agriculture. This portion of Colorado has attracted so much attention that there are now from fifteen to twenty thousand people waiting for the season to open sufficiently to admit of the prosecution of mining operations and settlement by agriculturists.

MINING SALE.—The *Nevada Transcript* says: We understand that Mr. Nickerson, who lives on Wolf creek below the Lime Kiln, in this county, is about selling his mine at that place. The mine is supposed to be rich in quick-silver.

Ventilating Mines.

Necessity and experience combined often bring to light and put into useful practice new and almost invaluable improvements in the working and development of our deep and wonderful mines—things that appear very simple of themselves, but which add incalculably to the economy of the work and the comfort of the workmen. That of which we would now speak is a new method for the ventilation and cooling of long drifts and tunnels, extending away from the shafts and regular air currents in the deep, lower levels of the mine. This is a matter that has been much studied, and many have been the various plans suggested, and it would take hundreds of thousands of dollars to cover the cost of the expenditures in fitting up the different kinds of blowers, air-compressors and other machinery devised for that purpose. But, says the *Gold Hill News*, it has been left to James G. Fair, Superintendent of the Hale & Norcross, Gould & Curry and Virginia Consolidated mines, to put into practical use one of the cheapest, simplest, and yet most invaluable improvements now in use. It consists of simply extending one end of the top cap of a set of timbers 18 inches beyond the usual length required, and making that amount of extra excavation. Then a partition of inch boards is carried up on the inside of the drift timbers, next to the excavation, leaving a clear open space on the outside, of 18 inches in width, the full height of the tunnel timbers. This division forms a complete draft, carrying the pure air from the outside in, and the foul air from within out, making the most complete ventilation possible. The draft of air thus created cools the sides and face of the drift, gives the workmen pure, healthful breathing, and thus enables them to do double the amount of labor, in comparative comfort. This principle Mr. Fair has put into practice in driving the north drift on the 1,900-foot level of the Hale & Norcross mine, which drift has been driven a distance of 249 feet from the main incline, with the most perfect ease and comfort to the miners. He is now engaged in putting the same plan in use on the lower level of the Gould & Curry, and expresses an undoubted faith in being able to run a drift in that manner to any required length whatever. The principal involved is certainly one of the soundest, and, should it be deemed necessary, the partition can be carried back and made to connect with a shaft from which there is always a good circulation of pure air. This improvement is undoubtedly a step ahead, in the right direction, and one well worthy the consideration of mining men throughout our State.

TWENTY-NINE PALM DISTRICT.—The new gold discoveries in San Bernardino county, about eighty miles from the town of San Bernardino, known as the Twenty-nine Palms, are attracting considerable attention. The *San Bernardino Guardian*, of the 7th inst., has the following in relation to them: William Smith, just in from the Twenty-nine Palms, brings us the best mineral news which we have yet heard. Of course these mines have already developed richly, but recent developments prove them to be the richest quart-producing mines on this Coast. We speak advisedly, having full confidence in the judgment and integrity of our informant, who is one of the most experienced quartz miners in the State. At a depth of 35 feet on a new incline, the ore is extraordinarily rich in gold, and the rock grows richer gradually as they sink. This is by far the richest gold vein yet found, even in that very rich mineral section. All doubts, even by the most skeptical, as to the existence of extensive and rich gold-quartz veins, are now completely dispelled. The Twenty-nine Palms is not only one of the richest mineral camps in the country, but it is absolutely certain that it is also one of the most extensive. These mines have already been located for a distance of five miles, on a north and south line; and the ore from every location develops quite as richly as that from the original one.

A GRAND SUCCESS.—The huge inverted syphon of the Virginia and Gold Hill Water company, which carries the water across Washoe Valley, is proving a grand success. It is now ninety days since it has been necessary to even so much as pass along the line to look at it. Day and night, warm or cold, it pours from the Sierras its constant volume of pure and sparkling water. Notwithstanding the severity of the winter, there has been little trouble with either the flume in the Sierra Nevada Mountains, which conveys the water to the inlet of the syphon, or that which brings the water from the outlet to the city. Having stood the test of such a winter as the present little fear of trouble at any future time need be entertained.—*Enterprise*.

THE MINING OUTLOOK.—It is gratifying to be able to state that at no time in the history of Reese River district has the mining outlook appeared as flattering as at present. The mines on Lander Hill are turning out a large amount of rich ore and have large quantities in sight. At Yankee Blade, New York Canon etc., a great deal of good ore is being produced and, as a rule, chlorides are doing well and making money. We are safe in saying that the billion product for 1874 will exceed that of 1873 by fully one half.—*Reveille*.

SHIPMENT OF ORE.—The largest shipment of ore ever made in one day on the Virginia and Truckee Railroad was made last week, and consisted of 1,177 tons.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.] For 6 days ending Wednesday, Mar. 18, 1874.

our local obtained while there on Thursday, of the Nevada Quartz Mine (Soggs') situated on Deer creek, a mile below Nevada City. This mine is now only 300 ft. deep. While sinking the shaft the last 100 ft. it was found that the ledge had been broken; lots of trap rock coming in; but this week, while drifting on the lowest level, on the north side, about 30 ft. from the shaft, the men found a well defined four-foot vein, which shows free gold that it does one's eyes good to see. The rock from this drift will probably mill \$50 per ton, while on the same side about 50 ft. from surface is a smaller vein, of decomposed quartz, out of which the foreman took a dollars worth of gold from a horn-full of dirt. Attached to this mine is a fifteen-stamp mill which is kept running all the time.

NEVADA ITEMS.—*Transcript*, Mar. 14: Messrs. Jones & Keith intend erecting a quartz mill in the rear of Keith's blacksmith shop, near the plaza, shortly. It will be run by water power, and they are already at work on the wheel, which will be 24 feet in diameter, and will afford power enough to run all the machinery of the mill. There will be two batteries having two stamps each. The latest improved pans, and machinery of all kinds, are intended to be put in.

STRUCK IT RICH.—We were yesterday shown some very fine looking rock, which came from a ledge situated on American Hill, near town. The rock is filled with sulphurets, and is rich in free gold. This ledge is about sixteen inches thick and prospects well. Messrs. J. F. Carr and Thomas Miner are the owners. They are now engaged in further prospecting it.

SEVEN-THIRTY MINE.—*Union*, March 18: This mine is situated near Deadman's Flat, about 5 miles south-west from Grass Valley. A year ago it was sold to Mr. Burroughs. A few days ago Mr. Burroughs sold the mine to E. P. Sanford and R. D. McCook. The purchasers commenced work a day or two ago on the Seven-Thirty by sinking a new shaft on the ledge. This new shaft has shown well in free gold. In one day a candle-box full of specimens came out, and the gold in that rock is estimated to be worth about \$500. We saw a chunk of the rock yesterday, about the size of a big man's fist, which was valued at from \$40 to \$50. The Seven-Thirty was sold a year ago, for a delinquent tax of from \$30 to \$40. The purchasers can pick up their money anywhere on the ledge.

OUR GRANITE QUARRIES.—Few of our people realize the importance of the extensive granite ledges lying just back of Santa Cruz. The Parson's quarry, and the quarries on Baelder's land up to Blackhorn creek, have lately been inspected by parties from the city and are pronounced superior to the quarries at Folsom. A railroad will be built from the beach to the quarry and a line of vessels kept constantly employed transporting the blocked marble to San Francisco. Hundreds of men will necessarily be employed in and about the business, should the quarries of this section be purchased by the city paving company.

PLACER.

HYDRAULIC MINING AT BATH.—*Argus*, March 14: We learn that the Roush mine is not working very extensively at present, owing to the scarcity of water, caused by the cold weather, but as soon as the snow commences to melt there will be an abundant supply; from indications, this claim promises to be one of the finest in Placer. The Paragon, to the east of the Roush, appears equally as good, although more expensive to work, on account of the great predominance of rock and cement. The Hazard mine, in Volcano Canon, is now prospecting better than ever before; the Hazard is very hard and should have a stamp mill in order to free the gold from the cement. This claim has been in operation almost two years without any encouraging prospects until the present time, when the developments are quite favorable.

SANTA CRUZ COUNTY.

GOLD IN GOLD GULCH.—*Enterprise*, March 14: Recently, parties have been prospecting for gold in the region of country of this county, near Santa Cruz, known as Gold Gulch, located on Mr. Treat's ranch, and have found such a flattering prospect as to make it highly probable that a company will soon be organized to secure of Mr. Treat the right to proceed with the work of sluicing. The quality of gold found is fine indeed, and is in sufficient quantity to justify no small outlay in order to proceed successfully with the work. An old and experienced miner has made a thorough exploration of the ground and pronounces it rich. Some lucky man may yet find the lead from which the notorious holder from which \$50 was taken, had parted, and awaken some little interest in the development of our mines.

SIERRA COUNTY.

LOSING THE LEAD.—We are informed, on very good authority that an item recently appearing in our Mining Summary in relation to the North America Mining Co., Sierra county, having lost their lead, is wholly incorrect. The statement was made on the authority of a correspondent of the *Mountain Messenger*, from which paper we copied the item. The correspondent was no doubt mistaken, as the North America Co., although the bed-rock in their main drifts has lately been lower than usual, never had a better lead than they have at present, and their prospects were never better.

SANTA CRUZ COUNTY.

SANTA CRUZ OIL REGION.—*Enterprise*, March 13: A gentleman of much observation in the appearance of, and manner of working oil wells in Pennsylvania, has just returned from a two-days' visit to the oil regions of this county, lo-

cated just back of Sonnet, and says the indications of an abundant supply of crude petroleum are far better than at many places in the East, where, through moderate boring, a great flow was obtained. Some specimens of coal, and slates, or slates casings, which to his mind evidence the fact of extensive coal deposits, were brought away. The oil is oozing from the region in quantities that justify saving it for refining purposes. Mr. Peasley, the superintendent, says that more than a barrel of crude petroleum per day can be gathered that will yield some ninety per cent. of pure oil. This region is, of late, attracting much attention, and is destined to be most thoroughly prospected for deposits of both coal and oil. That there is oil in abundance somewhere in that vicinity is proven by the constant flow of a very superior quality of crude petroleum; but the amount of boring required to procure a paying flow is a matter yet to be tested.

TRINITY COUNTY.

WATER PLENTY.—*Journal*, March 14: For the first time in several weeks, miners everywhere in the county are at work with all the water they can use. It is but fair to presume that the extreme cold weather is now at an end, and that water will be plenty for the next five or six months.

GETTING READY.—Mr. D. W. George, Superintendent of the Weaver Ditch and Hydraulic Mining Company, arrived last Monday evening, and has since been very actively engaged in making preparations for commencing work on the West Weaver Ditch. To-day (Friday) they will go into camp at the old Mountain House; and, if the weather is reasonably good, work will commence with the next week. A large quantity of necessary tools have arrived from below, and provisions, cooking utensils, etc., have been purchased here, and forwarded to the camp. Everything will be pushed with all possible dispatch, and those interested, confidently expect to have both ditch and mine in running order early in May.

PAYING WELL.—Hager & Haas, on the hill back of Junction City, have a good claim, and are making it pay. They made a clean-up the other day, taking out over \$2,000 from a run of four weeks. Of this amount, \$648, or nearly one-third of the yield, was saved in their under-current. Last fall this company ran a 7-ft. bed-rock tunnel of 225 ft., for the purpose of obtaining more fall, and have put in a 4-ft. flume, on a grade of 8 inches to the box, and a 12-ft. under-current, 36 ft. in length, with 12 inches grade to the box. This week they commenced running through the new flume and expect to run off much more dirt than formerly. Hager & Haas own the first right to the waters of Clear Gulch, which lying on the south side of the mountain has kept their ditch filled all through the cold weather, and will keep up the supply until late in the season.

VENTURA COUNTY.

PITB.—*Signal*, March 14: Mr. Griffin Robbins, just in from the Pitb mines, says that a wealthy company is constructing a large flume. The miners are confident that the mines will prove a success. The work is stopped for the present, owing to the heavy snow, which is three feet deep on the top of the mountains. Work will be resumed early in April.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—*Pioche Record*, March 7: Work progresses satisfactorily in the various drifts and shafts of this mine, and the mills at Dry Valley, belonging to the same company are kept constantly running. A great number of men are employed by the company. Yesterday the Summit shaft was down 976 ft. and sinking still continued. The west drift from the fifth station, Summit shaft, is being pushed ahead rapidly, and the indications in this part of the mine continue favorable. No. 3 shaft is fast approaching the 1,200-ft. level, and looks as well as ever.

PORTLAND.—The drifts are running east and west, and the ore being raised continues of that kind noticed by us last week. The developments in the mine surpass the expectations of the most sanguine.

RAYMOND & ELY.—The shaft is down 1,190 ft., and sinking continues; in a day or two a new station (the twelfth) will be put in. Drift from the tenth station is in to the ledge, and some good ore is met with. Stopping is going on between the seventh and eighth levels as usual. The supply of ore is not as great as it has been heretofore.

HIGHLAND.—The works of the east drift is under good headway, and some ore is in sight. Preparations are being made for hoisting and a short time Highland district will add its quota of bullion to shipments from Pioche.

PIOCHE.—On Monday last started drift from a depth of 600 ft. in the new shaft, which is being pushed rapidly for the ledge. Some splendid ore was hoisted yesterday from the old shaft.

CAROLINE.—Indications are regarded as very favorable.

CHIEF EAST.—Ore is being extracted from the 225-foot level, and there are now about 40 tons of ore on the dump.

AMERICAN FLAG.—The mine continues to be worked with energy.

NEWARK.—Shaft down 820 feet. The usual number of men are kept at work sinking.

HUGH AND HUNT.—Prospects of reaching the ledge continue. Drifting continues, and all the surroundings are favorable.

PIOCHE WEST.—Drifting for the ledge commenced a few days ago.

WASHINGTON AND CREOLE.—Sinking and drift-

ing continue. Appearances are still encouraging.

SILVER PEAK.—Incline down 500 feet, at which point the ledge widens, and has greatly improved in character.

WASHOE DISTRICT.

OTHER.—*Gold Hill News*, Mar. 12: There is no particular change to note of the prospecting operations on the 1,300-ft. level. The winze from the 1,465-ft. level has apparently passed through the west ore body, which was found to be even richer than it was on the level above. The ore body, where penetrated in the winze, pitched sharply to the east, and hardly leaves a doubt but that it will continue to below the 1,700 ft. level.

CONSOLIDATED VIRGINIA.—The ore stopes and breasts on the 1,000, 1,200 and 1,300-ft. levels all continue to look splendidly. The north winze is down to the 1,400-ft. level, the entire distance in good ore. The bottom of this winze is still in magnificent ore, some of the tub samples yesterday assaying as high as \$800 per ton. Sinking the main shaft is making steady headway.

CROWN POINT.—Daily yield, 500 tons of ore, from the 1,000, 1,200, 1,300 and 1,400-ft. levels. All of the ore breasts on the three first named levels are looking well. The north winze, on the 1,400-ft. level, has attained a vertical depth of 52 ft., all the way in good ore. The middle winze, on the 1,400-ft. level, is down 22 ft., also in good ore. The three floors which have been opened up on this level, are producing a large amount of ore of excellent quality. On the 1,500 ft. level, the main south drift following the course of the foot wall, is being driven ahead vigorously with a view of intersecting the middle and north winzes. The water on this level is decreasing rapidly and in a short time it is expected that the level will be entirely drained.

BELCHER.—Daily yield, 550 tons of ore. The main incline is down 126 ft. below the 1,400-ft. level, in hard blasting rock. The east drift, at the 1,400-ft. station, is in 100 ft., also in hard blasting ground. The winze, from the 1,300-ft. level, is down past the 1,400 ft. level, and is being continued on down to reach and ventilate the 1,500-ft. level. The ore is being extracted mostly from the 1,000, 1,200 and 1,300-ft. levels.

SIERRA NEVADA.—Daily yield, 65 tons of ore, keeping the mill steadily running. The ore breasts are all looking well, and the ledge appears to be becoming more solid, the ore requiring continual blasting. The drain tunnel for the proposed new hydraulic works is being rapidly driven ahead. Sinking the new shaft is progressing three feet per day.

GOULD & CURRY.—The heavy flow of water from the main east drift, on the 1,500-ft. level, continues without intermission, and is all that can be handled by the pump.

LEO.—The vein matter shows indications which are liable to develop into a pay chimney at any time. From the stopes above the adit level considerable quantities of good milling ore continue to be extracted.

HALE & NORCROSS.—Cross-cutting and prospecting the 1,900-ft. level still continues, without change of interest, except a widening out of the ore streaks previously mentioned in cross cut No. 3, from the main north drift, near the Savage line.

SAVAGE.—Sinking the main incline below the 1,900 ft. level is making steady headway.

OVERMAN.—A north cross-cut from the 200 ft. station, in the winze, from the 1,000-ft. level has been started, following the west wall of the ledge almost the entire face of the drift being in fine ore.

KENTUCK.—The cross cut which has been started eastward from the drift which connects the Crown Point and Yellow Jacket mines on the 1,500-ft. level, is now in 66 ft. From the strength and character of the ore found on the 1,500-ft. level of the Crown Point mine, at a much farther northerly locality than at the upper levels, it is believed that pay ore will be found in this cross-cut.

UTAH.—The face of the main west drift has cut through the east wall into the ledge, developing a fine body of quartz, which gives some excellent assays. The ledge at this point appears to be quite solid, and the face of the drift is perfectly dry, while the body of water still stands in the old shaft many feet above the level of the drift, and is steadily drained through the loose formation of rock further back.

SOUTH COMSTOCK.—The cross-cut east, at the 150 ft. level, is to-day in 18 feet. Fourteen feet of this is through ledge matter, that in the face of the drift not being of quite so favorable a character as that already passed through. The average assays of the drift thus far have been from \$17 to \$35 per ton.

GLOBE CONSOLIDATED.—Stations are being opened and drifts run in the ore body developed in the up rise, preparatory to extracting ore.

EUROPA.—After passing through 94 ft. of solid quartz, the main west drift finally reached what is supposed to be the west wall of the ledge. At that point a drift north was started, which is to-day in 13 ft. The rock assays well and looks so favorable for a paying deposit that it is the intention of the company to commence sinking a winze from this drift day after to-morrow.

DAYTON.—The mine is looking splendidly throughout. The ore bodies on both the second and third levels, if anything, show improvement in the quality of ore. The bottom of the north winze, from the second level, is still in rich ore. The ore is being sent to the mills as fast as the bad condition of the roads will permit.

BALTIMORE CONSOLIDATED.—The steam connections with the new boilers have been completed and sinking the main shaft below the 600-ft. level was resumed again this morning.

CHOLLAR POTOSI.—Daily yield of ore, 90 tons per day; the assay value of which is \$29 per ton.

BUCKEYE.—The east cross-cut from the 450 ft. level, has penetrated the ledge a distance of 22 ft., without yet finding any east wall.

JULIA.—The main south drift on the 900-ft. level cut into a fine body of ore during the week; proving that the ore is improving as the work progresses further to the southward.

FLORIDA.—In the winze in the north drift or crosscut, from the main tunnel, some very good looking rock has been encountered, assays averaging \$12 per ton.

CALIFORNIA.—Both the north drift from the Virginia Consolidated and the south drift from the Ophir, on the 1,300-ft. level, are making rapid progress.

LADY WASHINGTON.—Repairing and preparing the shaft for a new and much larger pump is making rapid progress.

SUCCESS.—The new station at the 300-ft. level in the little shaft, east of the mill in the canon, has been completed and a drift started to prospect the ledge.

NEW YORK CONSOLIDATED.—Preparations for putting in a larger pump and four new boilers are being rapidly completed.

SEGREGATED ROCK ISLAND.—A drift has been started from the main west tunnel, to connect with the old shaft, for the purpose of better ventilating the mine.

LADY BRYAN.—Lumber and machinery are being delivered and the new shaft and other mining work will be started forthwith.

YELLOW JACKET.—The prospecting cross-cuts on both the 1,400 and 1,500-ft. levels are making good headway, both in favorable working ground.

SUTRO.—The main north drift is being driven vigorously ahead. There is a streak of quartz in the face 2½ ft. in width. The ore assays \$15.

JUSTICE.—Much better progress is being made in sinking the incline below the 400-ft. level.

DANEY.—The shaft is down 363 ft. in good sinking ground. The water does not interfere with sinking.

ALPHA.—The north drift on the 1,500 ft. level is being pushed steadily ahead, occasionally cutting some small streaks of ore.

WOODVILLE.—Driving the north drift on the 300-ft. level to reach the ore body, is making steady headway.

BULLION.—Driving the main north drift on the 1,700 ft. level of the Imperial is making good progress.

Arizona.

BRADSHAW AND WALNUT GROVE.—*Miner*, March 7: George Monroe, John Timmons and others are running four arrastras, by horse power, on Hmhng creek, and making good ore. They have the richest kind of free gold ore.

At Walnut Grove, a Mr. Hill is constructing an arrastra, and Messrs. Condon & Wade are erecting what Mr. B. called a quartz mill. Rich float rock was recently found near the Placitas and prospectors were hoping to find the ledge from which said float started.

One of the ledges recently discovered by Mr. Bradshaw, in the Castle creek country, east of Walnut Grove, is very large and contains both gold and silver. He thinks of putting up a furnace and melting the ore.

Several arrastras are running on rock which pays from \$50 to \$150 per ton, at Antelope Hill.

Colorado.

DEL NORTE DISTRICT.

COPPER ORE.—*San Juan Prospector*, Mar. 7: One of the finest copper specimens we ever saw was shown us yesterday by Mr. S. H. Crowell, an old San Juan prospector. It showed native copper in abundance, and was evidently very rich. It was taken from one of two copper lodes, located near the La Plata river. An assay made from this lode yielded ninety per cent. copper.

MINING EXCITEMENT.—Considerable excitement was occasioned late yesterday afternoon by the announcement that a rich lode had been discovered within one half of a mile from Del Norte, on San Francisco creek, near Mr. Hnghee's ranch. A piece of top rock purporting to come from there was assayed by Mr. Howard, and yielded \$30 to the ton. The party making the discovery claim to have a well defined crevice one foot wide.

MINING DISCOVERY.—It is rumored that in digging the foundation for the new saw mill, which Gile & Co. are putting up on the Piños creek, near here, a rich gold lode was discovered.

Utah.

LITTLE COTTONWOOD ITEMS.—*Salt Lake Tribune*, March 11: The strike in the lower levels of the Emma Mine is creating considerable interest in mining circles, and it is considered as a "good omen" that the bottom of this famous mine has not "fallen out." The ore struck is said to be in the lowest works of the mine, and is of a white, soft character, assaying up in the thousands, and is considered richer than any heretofore taken out of the mine. The vein struck is between five and seven feet, and is increasing in width. The shipments from this mine this week have been larger, and the ore of the highest grade.

THE FLAGSTAFF.—We learn that this mine has struck another body of good ore, which is said to be quite extensive. All the works of the mine are looking well at present, and they are shipping about 60 tons daily.

The shipments for the past week show a slight increase, and were as follows: Flagstaff, 450 tons; Emma, 60 tons; Vallejo, 20 tons.

Hume Capital Versus Foreign Capital.

While it must be admitted that the introduction of English capital first benefited Utah and brought her mineral resources into notoriety, it must also be conceded that the advantages so gained have almost, if not quite, been overbalanced by the persistent howling of those who have invested injudiciously, and without sufficient investigation.

The history of past English investments in Utah, extending over a period of about two years, proves that the only benefits which have accrued, so far, have been temporary, and that the subsequent collapse of Utah Mines in London has really wrought us more injury than the original investments have done us good. Of the many millions of dollars invested in our mines by the British public but a very small proportion has benefited our citizens, the bulk of the amount having gone into the pockets of the schemers, and those who have no interest in Utah other than speculating on her mines. Outside of disbursements for bare working expense, and the money received by a few citizens originally owning such properties, and which has been expended here in permanent improvement, English capital so far has availed Utah but little. The Emma and Flagstaff mines are notable instances of the truth of this assertion, for apart from the sums received by our own citizens and the disbursements for labor, but little of the products of these mines has reverted to the credit of the Territory.

While it is just to ascribe to English capital, in the first instance, the bringing into notoriety of Utah mines, it is also apparent that subsequent events have proved that English investments in Utah have also been the cause of the present depreciation. Indeed, so well is this understood that no efforts are now being made to place Utah mines on the London market, for the reason that public confidence has been destroyed—not by the original Salt Lake vendors, but by Englishmen themselves, who, not content with moderate and ordinary business profits in effecting a sale of property, still continue to so manipulate the stock and dictate the management of the property in London that the results to Utah are anything but beneficial.

It is a notable fact, and one well worthy the consideration of Utah mine owners, that English capital in Colorado and other mining Territories has not contributed much towards the material growth of those sections of country, and it is becoming apparent that their history is being repeated here to a very considerable degree, in fact, so much is this the case, that the efforts of mine owners are now being directed to the securing of capital from the Eastern and Western States.

Nevada, with her \$22,000,000 yield of last year, is comparatively free from the demoralizing influence of British capital; we say demoralizing because it is safe to assert that had the Comstock lode been owned in England a few years ago it would not have been in its present prosperous condition, for the reason that past experience teaches us that English capitalists purchase American mines more to speculate on, than to render productive by judicious and persistent development, such as has characterized the great Comstock lode. Such experience also teaches us that English capital expects a mine to pay for itself during the first year or two after its purchase, and that it cannot stand the system of assessment practiced in the West, and which has really been the means of developing many mines which would otherwise have remained in obscurity. The secret of this is, English capital is easier discouraged by reverses than American.

We are especially pleased to notice the growing disposition on the part of Eastern and Western men to invest in Utah mines, not more so, however, than to witness the growing desire on the part of our mining men to invite such capital, by offering property at figures that will fully justify its expenditure in this direction.

Already we hear of preparations being made to concentrate Eastern and Western capital in Utah for the purpose of investing in mines, as also, for the establishment of bullion banks, and the erection of more reduction works. Such evidences, of course, bespeak confidence in the future of Utah, and prove that although English capital has become discouraged by adverse, home capital, which is far more desirable, is beginning to awake to the fact that Utah presents extraordinary inducements for its employment, and that returns will prove both safe and large on intelligent and business-like investments.—*Utah Mining Gazette*.

THE OLYMPIA COURIER says: "The Reuton coal mine, on Black River, near Seattle, now being opened preparatory to thorough work, give promise of great benefit to the vicinity, and the country generally. Messrs. Wilson, who are running the foundry here vigorously, have given some of the coal a practical test, and they are well qualified to do so. They pronounce it first-class for steam purposes—at least thirty per cent. better than that of the Seattle Coal and Transportation Company's mines, and that is regarded as good."

SUPERINTENDENT JONES is driving work on the Crown Point mine. Orders have been received at all the mills running on the company's ore to keep on hand duplicates of all the machinery which is liable to break.

Squirrel Exterminator.

Mr. James Hebborn, of Natividad, sends us a drawing of a device which he uses for driving sulphurous fumes into squirrel holes, a small cut of which is shown below. There is nothing new in destroying squirrels by means of sulphur, but the difficulty of doing so is great. This little machine is said to accomplish it easily, and as it can be made by any tinner, is worthy of notice by those who are sufferers from these pests.

There is a sheet-iron cylinder, rather larger than a common stove pipe, with a tapering nozzle. In it is a perforated partition. On the large end is a snugly fitting cap, like that on the top of the can used by milk peddlers, but having a tube to receive the nozzle of the bellows. The bellows are of the ordinary construction, and should be some fifteen or eighteen inches across. The mode of applying the contrivance is as follows: A shovelful of live coals is placed upon the partition within the cylinder; the nozzle is inserted into the squirrel hole; a large tablespoonful of sulphur is dropped upon the coals; the cap is affixed; the bellows attached, and worked. In a few seconds a dense, sulphurous smoke issues from every hole which has any connection with that attacked, even though thirty or forty feet distant, and by stopping these up with earth and applying sufficient force to the bellows the smoke can be driven through even the crevices and worm holes. Mr. Hebborn states, as a curious fact concerning the wonderful vitality of the pests, that the rough treatment sketched

SQUIRREL EXTERMINATOR.

does not always kill the squirrel, though it mildly suggests to them the advisability of moving their quarters, in which case they are easily dispatched as they seek to escape; and asks that some one should suggest a more deadly poison.

PANAMINT MINES.—The *Havilah Miner* of the 7th contains the following: Some of the richest specimens of silver ores that we have ever seen are on exhibition at the Bella Union Hotel. The ores were brought from the Panamint mines, by Mr. John Rupp, a former miner of Kern, who asserts that the wealth of these mines is almost unaccountable. Old miners from the Comstock report this country as exceeding anything in Nevada. The mineral belt is simply immense. The ledges average in width, all the way from four to twenty feet. Little work has been done, except on the Wonder and Wyoming mines. These mines have been sunk on, from fifty to eighty feet; and, in that distance, have widened over two feet; beside, the rock has increased in richness, prospecting no less than two thousand dollars, and as high as five thousand dollars. They now show a most wonderful development of mineral, several solid feet of the argentiferous metal being in sight. Many more mines as good as these are lying idle with their millions hid away in the recesses of the earth, that only requires capital for its extraction. The owners of the mines are, without an exception, poor. They know they have a good thing, and are waiting for capitalists to step in and buy, or to put up a mill or furnace. This article is not written to get anyone to "bite," but is a true statement of the, no doubt, richest undeveloped mines in the world. A site for a city has already been selected—town lots bring from fifty dollars to one hundred dollars, and a Virginia city in California is imminent. At present, the population of Panamint is seventy.

EEBERHARDT & AURORA MINES.—Conversing with miners who are now engaged in the mines, of the Eberhardt & Aurora Company, on Treasure Hill, we are led to believe that no change, except it may be for the better, has shown itself in the appearance of the same, both as to quantity and quality of ores. In the chamber immediately above the famous Peerless Chamber, fabulously rich rock is being extracted, and all indications point to its continuing down to the latter workings. When these two chambers are connected, which must be ere long, a repetition of the Mammoth Cave of Kentucky will be presented to view, with the exception, however, that in the former case, stalactites and stalagmites abound; and, in this, rock rich in the precious metals surround one on every hand. One point is conclusive, which is that the Peerless Chamber has ore enough in sight to keep the mill at work for many months. Other portions of the property are also said to be looking well, and everybody connected with the company is in fine spirits, and full of hopeful anticipations of the future. We have promised ourselves a visit to the locality shortly, and will then lay the facts before our readers.—*White Pine News*.

Calico Printing.

In all the appliances of chemistry to the requirements of man, there is none more interesting than that of dyeing. Almost everyone knows something of the art; and yet he would be very much surprised could he but see a little of that which he knows not. The dye house is generally a very uninviting-looking place, the air being filled with condensed steam, and the woodwork covered with moisture, which often collects on the floor in quite large pools, and with stains of different dyes; the vats are filled with dirty-looking liquids, the color of which it would be difficult for an inexperienced person to tell. Where the goods have simply to be dipped in the requisite solutions, and the colors, if need be, afterwards brightened by being soaped, etc., we are apt to look upon it as a mere matter of course, however great may be the skill necessary to make the solution, or perform the different manipulations. That which strikes the stranger most with wonder is, that the prints that he sees in the shops among the commonest kinds of dress goods, undergo by far the most complicated process of dyeing. In the first place he has seen them pass the cloth over a red hot plate, or through a gas flame in a manner which, he thinks, would damage it beyond redemption; but it simply removes the fuzz, which would interfere with the printing. When, after bleaching, he sees it on the printing machine, and remarks that the colors are not very pretty, he learns that they are not the intended colors of the goods, but simply used to tell the printer if the pattern fits properly. After printing it is left in a warm, moist atmosphere, and afterwards passed through a bath of cow dung, or dung substitute, and washed until, in some cases, the goods cannot be told from those just blacked. It is then passed through the dye-vat, and when taken out, is found to be dyed in different colors, according to the pattern which has been printed upon it. The reason of this is, that cotton will not take the dye like wool or silk, but must have another substance, called a mordant, used at the same time. Different mordants produce different colors with the same dye; thus acetate of iron will produce black with madder, while acetate of alumina will produce a red, and mixture of the two a chocolate. The mordant then are printed upon the goods, in the required pattern, which will appear after coming from the vat. This is by no means a modern idea, since Pliny describes it as being used in his day; but it is curious enough to be interesting to some of our readers who have never visited a dye house.—*Journal of Applied Chemistry*.

SIGNALING IN MINES BY ELECTRICITY.—At a meeting of the North Staffordshire Institute of Mining and Mechanical Engineers, held at Stoke-upon-Trent, on Monday evening last, Mr. T. M. Goddard read a paper on "Better Communication in Pit-Signalling by means of Electricity." It was essentially to the successful working of the system that the wires should be well insulated to prevent breakages. This system required less room than the old one in shafts; and the wires required no play, as did the old stranded bell wire. However much the wire was coiled, contact remained perfect, independent of distance, thus avoiding the necessity for laying wires in up-cast shafts, where the effects on wire were so detrimental. By this system the noisy clapper was done away with, except in shaft repairs. Engine-tenders were no so liable to make mistakes with the new as with the old method. He showed that it was a great advantage to avoid the up-cast for signaling, as they might by the new system. Where cages are working in wooden conductors in shafts of small area, there was no danger of the cage tearing the wire from the staples, and cutting off communication between the hooker and engine-tender. Where minerals were got below the down-cast, wires could be conducted down, and signals communicated as effectively as if they were sent direct up the up-cast, showing this system peculiarly applicable where ventilation by fan was not in use. He pointed out that the new system was more economical, and more easily maintained; and argued that it was more efficient than the old system. Several members expressed themselves favorable to the new system, and it was decided that Mr. Goddard's paper should be printed.

MINERS' WAGES IN AUSTRALIA.—The average rate of wages for miners in the Ballarat district, when the mail left, was £2 5s. per week, with eight-hour shifts; breaksmen were getting a slightly higher rate. In Bendigo district quartz-miners in deep sinking, for pit work, were getting £2 10s.; ordinary quartz-miners getting £2 5s. per week; engineers receiving £3 to £3 10s. In Bendigo most of the work is done on tribute. In Alexandria, Maryborough and Daylesford miners were receiving £2 10s. per week. Most of the work in Gipps Land is done by contract. Where wages are paid, the men were receiving from £2 10s. to £3. Boilermakers, smiths, fitters and turners were getting 10s. to 12s. per day; laborers from 6s. to 7s. per day. Owing to the meat-preserving companies not being fully employed, a good many tinsmiths were out of work. In the trade the rate is from £2 10s. to £3 per week of ten hours per day. Plumbere and gasfitters were receiving £3 to £3 10s. per week of eight hours per day.

A LETTER FROM CAÑON CITY, says the miners are busily engaged in arranging and repairing flumes, changing position of hydraulic pipe, cleaning out ditches and making general preparations for their summer's work.

The Bladen Mining District.

This is the name of the new mining district organized at the mines recently discovered in the San Jacinto mountains, near the San Bernardino line. The ores are rich in silver, with some admixture of gold. We have lately mentioned the fact that the company in which our townsman, Mr. D. G. Christian, is interested have commenced the erection of a mill at their mine. No doubt longer exists that extensive and permanent silver mines, yielding very rich ore, have been discovered in that portion of San Diego county. We saw yesterday a ton of silver and gold from two ounces of average rock, taken from the mine referred to; and Rev. I. H. Cox informs us that ore is taken out that will assay \$1,000 to the ton.

A few days since a new district was organized about five miles southeast of the Bladen district, where rich discoveries have been made. In fact, the croppings are found to exist continuously for about eight miles from the Bladen district. A number of miners are now going down on the ledge.

These mines are in the same elite range as the gold mines of the Julian district, and are situated only about forty miles north of Julian City. It is our opinion that this whole range will be found rich in mineral wealth. Prospecting may be said to have only just begun in our mountains, and when the country is thoroughly explored we are confident that mines of great value will be developed. In our neighboring county of San Bernardino prospecting has lately been going on very actively, and exceedingly important discoveries have been made near the line between the two counties, in the same range of mountains. Gold and silver will be not the least important of the products of these counties in a short time.—*San Diego Union*.

A SINGULAR GIANT POWDER ACCIDENT.—The *Virgilia Enterprise* of March 4, relates this incident: "A strange accident with giant powder occurred at the Blue Jacket Mine, just north of the Sierra Nevada Company's new shaft day before yesterday. The accident occurred in this wise: William Quayle had placed two frozen giant powder cartridges in a tin can with some water, and had the whole on a blacksmith's forge heating. He was holding the can on the fire with his right hand, while he was blowing the bellows with his left. The can was held upon the stove in a slanting position, and the side thus left bare of water became red hot. By some means one of the cartridges broke in two, and the upper portion fell against the tin and instantly exploded. Quayle had, on the hand with which he was holding the can, a thick huckskin glove. This was rent into shreds and blown entirely off his hand without injuring his fingers, though he received a deep and bad cut in the back of his hand. He also received a severe wound in the right leg, just above the knee, from a piece of the can, which was torn to fragments. The singular point in connection with the accident, however, is that only the upper half of one of the cartridges exploded, though the remaining whole and half cartridge must have been very near to, if not absolutely touching, the half exploding. This strange result can only be accounted for by supposing the portions of the cartridges, which did not explode, were still frozen; and they thawed less rapidly in the water than did that piece which was in the air near the hot tin. Frozen giant powder—even when the proper percussion cap is discharged in it—does not explode, but burns in a fizzing manner, as would damp black powder, until the cartridge is consumed. In this instance, however, the giant powder remaining was not even set on fire."

THE STRIKE AT SILVER CITY.—We are informed by James Wardell, of Silver City, that, evening before last, the owners of the ledge in which gold-bearing quartz of extraordinary richness was struck a few days since (of which strike we made mention at the time), have, at a greater depth struck richer rock, than that at first found. It will be remembered that the first rich quartz found in the mine was just after passing through the east lay, the shaft then being about 70 feet in depth. The rich streak was two or three feet in thickness, the rock below being of an ordinary character. The men continued to sink upon the vein, which pitches to the east, for the purpose of passing through it; when, if nothing more was found, they intended returning and following the rich streak above. Evening before last, however, at the depth of about ten feet, they came into quartz exceedingly rich in free gold. How far down this may extend is a matter of conjecture, but the chances are that they are now near the west wall. Having such rich rock on both sides of their lead is a good indication of the deposit proving extensive and permanent. Mr. Wardell informed us that one piece of quartz shown him, about the size of his thumb, must have contained at least half an ounce of gold. The croppings of the ledge are very large, and are supposed to indicate a chimney at the point where the shaft is sunk. The people of Silver City feel pretty confident that the new strike is one of great value.—*Enterprise*.

THE MINERS in Southern Oregon have now sufficient water to keep them busy for some time. It is estimated that several thousand dollars will be taken out in Jackson and Josephine counties this season.

USEFUL INFORMATION.

A Paper and Glass Debate.

A correspondent sends a couple of interesting questions, which he informs us are to be the subject of a debate, relating to the merits of paper and glass. The first is: "Providing we had no paper, what other substances may be mentioned that would take its place?" And, second, "Providing we had no glass, what are its possible substitutes?" Of course, the idea is to bring out, in the present connection, not names of substances, which may be advantageously used instead of the above-named almost indispensable materials, but of such as we probably would employ, (and of many of which in fact our ancestors did avail themselves), did glass or paper cease to exist or become unobtainable. The case is imaginary, but leads to much instructive thought.

In lieu of glass, we can find material suitable for window panes, for drinking vessels, and, in some cases, even superior to it for small lenses, but nothing that combines all its properties, or is capable of its ready manipulation into desired forms. For windows, perhaps the best substance other than glass is simple mica, which may be readily split from the rock in thin, translucent sheets. It is now used for doors of stoves, to protect paper shades around gas lights, and in other common employments. The Romans filled their windows with *lapis specularis*, a fossil of the class of mica, which is readily cloven into thin smooth laminae. The same substance is found in the Island of Cyprus, in masses a foot in breadth, and three inches in thickness. It is used for the construction of hot houses, and for the protection of delicate plants. Up to the present day it is also much employed in Russia, in place of glass for windows.

Horn cut into sheets is still used for lanterns, and for drinking vessels; and, if made sufficiently thin, would answer for illuminating purposes. Oiled linen, or other fabric, similar to that now used by draftsmen for tracing, would be also available, and so would very delicate sheets of india rubber. Skins, prepared like parchment, or vellum, would be translucent though not transparent. Gelatin, however, might be treated with bichromate of potash, so as to be insoluble; and, if it would stand the weather, would give quite clear window lights. Collodion films, we should imagine, if made thick enough, could also be used for the purpose, as also animal membrane.

In addition to mica, the mineral kingdom offers a variety of substances. There is the Brazilian pebble, a species of quartz, now used in an immense extent for spectacles and other lenses. We have seen perfect spheres of this material three inches in diameter, without a single speck or flaw to blemish its complete transparency. Rock crystal and other varieties of quartz might also be employed if means could be devised to cut them properly; so could plates of aelenite, thin alabaster, or even of rock salt, though the latter would not be very durable. Some shells are sufficiently thin to be translucent, and ivory could be made into plates having the same property. Amber would be transparent enough, but difficult to obtain, while, like ivory, it would be rather costly. Large leaves of trees, if chemically treated, might have their texture preserved and serve to cover windows, if other means failed; or if the dwellings were located in polar latitudes, one might follow the example of the Esquimaux and use blocks of clear ice.

In recalling substitutes for paper, many of the materials suggested in place of glass, owing to their translucency, would, from their flexible nature, answer even more suitably for writing purposes. Such is evidently the case with parchment, membrane, cloth, horn, rubber, collodion, or gelatin sheets. We might go back to graven tablets, like the Moabite stone, or write with the stylus upon wax, as did the ancients; in fact, there are numberless modes of inscribing our thoughts on solid substances. But paper has a multitude of other uses, especially in these days of paper clothing, paper furniture, paper churches and paper money. Hence material is needed with more of its attributes than simply its use as a vehicle for the dissemination of our ideas. The same source of supply, open thousands of years ago, is still at hand, for the papyrus tree still flourishes in Egypt and Sicily. The bark of the common white birch may also be employed; or by ingenious machines we can cut shavings of fine grained wood to serve in place of hangings for our walls. Sheets of metal, rolled to almost infinite attenuation, would, however, probably form the most favored substitute. About two years ago the Upper Forest Tin Works, in Wales, rolled the most delicate sheet of iron ever made. The iron was worked in a finery with charcoal, and the usual blast, then forged into a bar, and finally passed through the tin rolling mills. When finished the sheet was 10 inches by 5½ inches in dimensions or 55 inches in surface, and weighed but 20 grains. It would take 4,800 such layers to make up a mass one inch in thickness. Letters have been sent across the Atlantic on iron thinner than ordinary paper and nearly as light. Steel, iron and copper, could thus be pressed into service; and where flexibility was necessary, alloy could be made to answer the purpose.—*Scientific American*.

DRYER FOR OIL COLORS AND VARNISHES.—Water, 100 parts; gum lac, 12 parts; horax, 4 parts.

ABATE'S METHOD OF DECORATING WOOD.—A sheet of veneering is exposed for a few moments to the fumes of hydrochloric or sulphuric acid. Strong hydrochloric acid, commonly called muriatic acid, of the shop is probably the best for amateurs, as it is more readily obtained than fuming (nordhouse) sulphuric acid. Ordinary sulphuric acid may, however, be used if the wood be slightly wet with the acid, instead of being exposed to the vapor. After the exposure or wetting, the acid should be carefully wiped from the surface. A piece of white calico or paper or common wood may be used, upon which to produce the pattern of the veneer. Whichever of these materials is employed the reproduction is obtained by pressing the prepared veneer strongly upon the surface of the material which it is desired to ornament, a suitable press being employed for this purpose. For amateur work a common copying press will answer very well, if the surface to be decorated be not too large. After the impression is taken, the material to be decorated must be exposed to a strong heat to bring out the pattern, which is invisible before heating. About twenty impressions may be taken before the effect will cease, when the pattern will have to be prepared over again in the same manner as before. The impressions after exposure to the heat show a general wood-like tint, which is very natural for the light colored wood, such as walnut, maple, etc., but for mahogany, rosewood, and others of dark color, the articles to be decorated must be dyed the light color of the wood.

DEPOSITS IN BOILER FLUES.—Professor Hayes gives, in the *American Chemist*, the following opinion regarding the formation of these deposits: They are of two kinds, both of which are capable of corroding the iron rapidly, especially when the boilers are heated and in operation. The most common one consists of soot (nearly pure carbon) saturated with pyro-ligneous acid, and contains a large proportion of iron, if the deposit is an old one, or very little iron if it has been recently formed. The other has a basis of soot and fine coal ashes (silicate of alumina) filled with sulphur acids, and containing more or less iron, the quality depending on the age of the deposit. The pyro-ligneous deposits are always occasioned by want of judgment in kindling and managing the fires. The boilers being cold, the fires are generally started with wood, pyro-ligneous acid then distils over into the tubes, and, collecting with the soot already there from the first kindling fires, forms the nucleus for the deposits, which soon become permanent and more dangerous every time wood is used in the fire-place afterward. The sulphur-acid deposits derive their acids from the coals used, but the basis material, holding these acids, is at first occasioned by cleaning or shaking the flues, soon after adding fresh charges of coal. Fine ashes are thus driven into the flues at the opportune moment for them to become absorbents for the sulphur compounds distilling from the coals, and the corrosion of the iron follows rapidly after the formation of these deposits.

THE PRESERVATION OF TIMBER.—*Engineering* has had an opportunity of examining some specimens of timber preserved by a new and very promising process, invented by Mr. J. B. Blythe, of Bordeaux, of which our contemporary speaks as follows: Mr. Blythe treats the timber with carbonized steam—that is, with steam having mixed with it a small proportion of hydro-carbon vapor—the result being an evolution of acetic acid, and the formation between the fibers of the wood of a peculiar gummy substance, which hardens by time, and which appears to materially increase the resisting powers of the material. When first treated, the timber is so softened that it can be rolled to give it an even surface, or its form can be altered to a considerable extent by pressure, and it can be thus molded to many forms, which are at present only producible by the action of cutting tools. The forms thus given to the timber in a soft state are retained permanently. As far as can be judged from experience gained on the Northern Railway of France, on which line sleepers, treated by this process, have been down for some time. Mr. Blythe's system of treatment is an effectual preservative, while it has the great advantage of enabling green timber to be seasoned in a few hours. In fact, the sap-wood, when "carbonized," appears practically equal to the heart-wood in durability and powers of endurance.

A SIMPLE FILTER.—We find in an English exchange the description of a very simple filter, called "The Poor Man's Filter." It consists of a common garden flower-pot, of some nine inches diameter and ten inches depth. The drainage hole is stopped (not too tightly) with a piece of clean sponge. A layer of about two inches of animal charcoal is first placed in the pot, then a second layer of clean sand, upon which a layer of three inches of clean coarse gravel is placed. The pot can be set over an earthen jar, into which an abundant supply of pure water will filter for all drinking purposes.

The reason why common salt sometimes becomes moist when exposed to the atmosphere is because it is not pure. Chloride of calcium and chloride of magnesium are impurities generally present in salt, and they absorb moisture from the air.

LIMPID AND FLEXIBLE VARNISH.—Anhydrous alumina acetate, dissolved in turpentine, is the article recommended for this purpose, and it is said to be unalterable at elevated temperatures.

GOOD HEALTH.

Goitre.

In reference to the epidemic of goitre which has broken out among the young soldiers at St. Etienne, Dr. Bergeret has just made a communication to the Académie des Sciences, pointing out the influence of the sulphates in the production of this disease. He states that before the year 1835 all the inhabitants of Saxon in the Valais were either goitrous or cretins. They then drank water derived from a bank of gypsum, which on analysis was found to furnish one gramme of sulphate of lime per litre, besides some sulphate of magnesia. In 1835 the notable water was derived from a spot situated far above the bank of plaster; and since then goitre has much diminished. The children are no longer subject to it, and before long the disease will probably have disappeared.

But how does this fact go to explain the occurrence of goitre at St. Etienne, where the water is of such excessive purity that photographers use it in place of distilled water? It is, in fact, rain-water which falls on the primary rocks of Mount Pilate. The cause is to be sought for in the excess of sulphates which gain access to the circulation through an exaggerated muscular "dystrophie" induced by forced exercise. In fact, as long since observed by M. Chevreul, in order for the health of an adult to be maintained good he should weigh the same at the same hour every day—that is to say, that the anatomical elements, the tissues and organs, should receive assimilable principles of an equal weight to that of those which are destroyed, in order to maintain the animal heat and to execute the mechanical work imposed upon them. If what is received does not equal what is expended, consumption or anemia takes place.

This is what is observed in the goitrous soldiers in barracks who are subjected to excessive work, and who are not fed proportionately to the amount of force they are called on to expend. It is a phenomenon which presents some analogy to what was observed among the French laborers engaged during the construction of the Du Nore Railway, and later in certain factories. On the other hand, we know that when a muscle is employed with force and continuity, or when it is submitted for a certain time to the action of a continuous electrical current, such muscle, burning its own substance, becomes acid, and that the acids produced are the sulphuric and phosphoric, at the expense of the sulphur and phosphorus contained in albuminoid principles. Under the conditions of excessive work, then, a man has circulating in his blood an abnormal amount of sulphates, absolutely the same as if he had drunk water loaded with gypsum. This is what has occurred to the soldiers in the barracks suffering from goitre. In support of this theory M. Bergeret cites analysis of urine, showing that the sulphates precipitated are three or four times more abundant during the existence of goitre than in the normal state.

M. Larrey, in relation to goitre in young soldiers, observed that it, as well as enlargement of the cervical glands, were formerly of much more frequent occurrence than at present, the cravat having been substituted for the stiff military stock formerly in use.—*Druggists' Circular*.

PHYSIOLOGICAL CLASSIFICATION OF FOODS.—The most rational and practical classification is: 1st. Carbonaceous food. 2d. Nitrogenized food. 3d. Phosphorized food. 4th. Fresh vegetables. Of the first bread and butter is the type, and to it belong in general all articles in which starch or flour, fat and sugar predominate. They are the fuel, serving chiefly to sustain the animal heat by the slow combustion of the carbon, given off as carbonic acid in the act of respiration. Consumptive people must use this class of food in abundance. Of the second, roast beef is the type; and, in general, the flesh and blood of quadrupeds, which, when taken in one's stomach, is rather simply absorbed than digested; because, being already muscular ingredients, it needs no elaborate changes to be appropriated into our muscular tissues in order to supply their waste. Hard-working people need this in abundance. To the third class belong oysters and fish, especially to be recommended to persons using their brain much. Of the fourth class, lemons and lemon-juice is the type, good for everybody, for reason of the purifying, medicinal effect of fresh vegetables and fruits, stimulating the secreting organs, keeping the system pure, and counteracting all tendency to scorbute, scrofula, eruptions, indigestion, constipation, etc.—*Manufacturer and Builder*.

DIABETIC BREAD.—M. Dannevy proposes the use of bread made from roasted flour for diabetic patients, instead of gluten biscuit. He asserts that roasted starch cannot be converted into glucose, and that bread made out of the various farinas so torrefied is greedily eaten by patients who have been restricted to the ordinary preparation of gluten until they have become thoroughly disgusted. Moreover, under its use the thirst lessens, and the digestive derangements are markedly ameliorated.

A WRITER in the London *Lancet* thinks that the climate of Southern California is unrivalled in the world for softness, dryness and equality of temperature.

An Ingenious Operation.

We find in the Richmond and Louisville *Medical Journal*, an account of a most ingenious surgical operation, designed to remedy the turning of eyelashes upon the eyeball, in a case of twenty years' standing. The irritation of lashes thus turned in was so great, that the patient had been accustomed to relieve himself by pulling out his lashes. The perpetual irritation had, however, produced opacity of the cornea of one eye, and it was evident that this sad result would have taken place with the other in a short time, had not the following operation been performed: "A very fine curved needle was threaded with a double strand of fine silk; the point of the needle was then entered upon the tarsal border of the lid, at the very spot where the respective hairs emerged from the lid-surface, and, being pushed outward, the front of the needle made its appearance through the skin just above the row of eyelashes. When the needle had traveled the lid, the double thread, with a noose at its free extremity, was drawn upon until the noose was ready to disappear in the lid-tissues. The wild hair was now pushed gently through this noose, and, as the thread was drawn upon until it escaped from the outaneous surface of the lid, it drew the vicious hair in the same direction, leaving it still attached to its hair-bulb (for this is all-important), but drawn completely through the free border of the lid in a passage made for it by the needle, the point of the hair sticking out in front through the needle puncture. The rationale of the operation is, that the hair drawn through the lid will, by constant traction in its growth, change the position of the hair-bulb, and in this way correct the wild direction which it formerly took, to the serious injury of the patient." The ingenious surgeon who performed this operation was Professor Julian C. Chisholm.

CLOTHING OF INFANTS.—In the first stage of infancy warmth depends on clothing alone, for there is no muscular movement.

Avoid a degree of warmth which produces sensible perspiration.

Flannel and calico are the best materials in all seasons.

Dress the child loosely, and fasten with strings, not with pins.

The umbilical cord, navel, and belly band, require much attention.

Avoid keeping the child's head too warm, or its feet cold.

Avoid chilling the child, or taking it abroad in cold weather.

Attend to the form and size of the child's shoes, so that the feet shall not be cramped.

The practice of plunging infants into cold water, to render them hardy, is exceedingly dangerous.

Let a child's washing be very completely and carefully performed. Keep the child always perfectly clean and neat.

Be very attentive to ventilate the apartment where a child lives, but never expose it to draughts of air.

Begin early to form habits of personal cleanliness and delicacy.—*Ez.*

WHAT IS IN THE BEDROOM.—The importance of ventilating bedrooms is a fact in which everybody is vitally interested, and which few properly appreciate. If two men are to occupy a bedroom during a night, let them step upon weighing-scales as they retire, and then again in the morning, and they will find that their actual weight is at least a pound less in the morning. Frequently there will be a loss of one or two pounds, and the average loss throughout the year will be more than 1 pound; that is, during the night there is a loss of a pound of matter, which has gone off from their bodies, partly from the lungs, and partly through the pores of the skin. The escaped material is carbonic acid and decayed animal matter, or poisonous exhalations.

RAW TURNIPS.—Some one writes the *Herald of Health*: "I have always let my children eat as many raw turnips as they like. I heard a city woman say the other day they were not healthy, and I believe they don't hurt anybody. Will you please settle the dispute for us?" The editor answers: "Generally children are fond of raw turnips, of the flat, white, strap-leaved variety, if taken fresh from the field before very old and tough. If they are scraped with a knife they will not harm healthy, active children. If simply chewed they are not easily digested. As a rule, country children have better appetites and stronger powers of digestion than city children. They get more fresh air and exercise. There is more waste and more want, hence the same rule will not apply to both classes."

CURE FOR CORNS.—The safest, the most accessible, and the most efficient cure of a corn on the toe, is to double a piece of thick, soft buckskin, cut a hole in it large enough to receive the corn, and bind it around the toe. If in addition to this the foot is soaked in warm water for five or more minutes every night and morning, and a few drops of sweet oil, or other oily substance, are patiently rubbed in on the end after the soaking, the corn will almost infallibly become loose enough in a few days to be easily picked out with a finger nail. This saves the necessity of paring the corn, which operation has sometimes been followed with painful and dangerous symptoms. If the corn becomes inconvenient again, repeat the process at once.—*Hall's Journal of Health*.

Partz's Cube Sugar Process.

We have watched, with considerable interest, the practical development in this city of a recent invention, which seems to be destined to impart a new feature to an important branch of manufacture. It consists in a process by which hard, white sugar is produced in a much shorter space of time, and at less cost than heretofore, and by which, moreover, the sugar is furnished in the shape of well-defined cubes. The process has been introduced by its inventor, A. F. W. Partz, of Oakland, at the Bay Sugar Refinery on Battery street, where it has been in use now for several months, and where we have repeatedly inspected its operation.

There have been many attempts to convert granular sugar into solid cubes, or pieces of other shapes; but the methods employed were too slow and otherwise inefficient, and the products, besides, of an inferior quality; so that the old mode of making "cube-sugar," by sawing loaves into slabs and bars and cutting the latter into square blocks, has thus far been the only one successfully practiced. Yet, it takes about two weeks from the time the sugar leaves the vacuum-pan until it is finished in the form of loaves; and the work of dividing them into small blocks is quite laborious and expensive.

By Mr. Partz's new process granular sugar, taken fresh from the centrifugal machines, is in a few hours transformed into cubes of three-fourths of an inch in size, which are equal in firmness to those made from loaves and superior to them in appearance, in as much as they are more regular in shape and the crystalline luster of the sugar is not despoiled by sawing. These cubes are turned out by the one machine now in operation, at the rate of about 36 pounds per minute, and they are dried in two hours. The total cost of making them scarcely exceeds one-tenth of a cent per pound. To meet the increasing demand for this sugar, which has become already quite a favorite in the San Francisco market, especially among restaur-

rants, the Bay Refinery has given orders for another one of Mr. Partz's machines, which is yet to be supplied with some minor improvements. These machines, and the apparatus used in connection with them, are as simple as they are original in their conception, and we intend giving a detailed description of them and their *modus operandi* on a future occasion.

What we mainly lay stress upon, regarding this invention, is not so much the fine and convenient form in which the sugar is obtained by its application, as that it enables the manufacturer to produce good, hard, white sugar with so much dispatch and at a reduced price. Indeed, sugar discharged from the vacuum-pan at noon may be packed in barrels and stored before night, so that the factory is no further to be encumbered with a large quantity of partly finished sugar, consuming interest on the capital therein invested. The room hitherto occupied by thousands of conical molds can be dispensed with, and men need no longer work all the year around in a temperature of over 100 degrees Fahrenheit.

We understand that Mr. Partz intends to go to the East, and expect in due time to be advised by our exchanges of the introduction of his valuable invention in the refineries of the Atlantic States and Europe.

Why Quicksilver is High.

We have several times of late referred to the subject of the high price of quicksilver, and the influence it has on the mining interests of the coast. We have endeavored also to explain to our readers that the popular idea that it is high because there is a "monopoly," is a fallacious one. We all know that there used to be a "monopoly," but it was broken up some time ago, or fell to pieces when there was no longer a necessity for one. The common laws of supply and demand regulated the matter in such a way that there was no necessity for the three mines forming the "monopoly," to keep up the combination. Moreover, there were so many new mines discovered last year, which produced all the way from fifty to six hundred flasks, that they could undersell the combination. These simple reasons added to those that the supply was already decreasing, and the demand increasing, were sufficient to make the combination of no earthly use. A high price was bound to ensue, and did ensue.

The protective tariff on quicksilver has for a long time operated against the mining interests. The government never made anything by it, as we imported no quicksilver; and it could be bought in Europe, China and Mexico, much cheaper than in this State, where so much of it was produced. In the days of the monopoly, when the price was kept up by that combination, the supply exceeded the demand, and they sold their metal cheaper abroad than they would sell it here, which they could not have done if the tariff had been abolished. We notice that the California Legislature has passed the bill asking Congress to abolish the tariff on this article—a move in the right direction, and one of benefit to the mining interests.

If our capitalists were not so apathetic, and had more confidence in cinnabar mines, a greater number of these mines would be opened. As the wants of the gold and silver mines are increasing from day to day, and from one to two pounds of quicksilver is lost to every ton of ore worked, there is no danger of want of a market for the metal. The only danger is that the supply will still decrease as the demands increase. New discoveries of this metal are made every few days, but very few of the mines are opened and worked systematically, for want of capital. Last week new mines of this character were discovered near Elk Horn station, on the New Idria road, San Benito county; and advices from Mexico say that new quicksilver mines have been discovered in Zacatecas. Still, with all these new discoveries the price does not come down. It is absurd to say that the "monopoly" controls all the capital in the State, or controls all these new mines. The price is high from natural causes, and not from the workings of any monopoly.

The New Almaden mine is one of the richest in the world. It has a world wide reputation, and is the representative mine of California. Its product has been greater than any other mine in America, and though much reduced, this mine still continues to yield more quicksilver than any other in the United States. It gives employment to about 400 men, and has been systematically worked and developed. Through kindness of Mr. J. B. Randol, Superintendent of the New Almaden, we are enabled to lay before our readers a statement of the quicksilver production of the mine for 21 years and three months. The mine was worked from 1845, up to 1850, in a limited way, but no record of the yield kept. From that date to the first of this year, the mine has produced 573,150 flasks of quicksilver, containing 76 1/2 pounds each.

The table appended to this article is a very complete one, and is the first detailed statement of the kind ever published. A simple statement of the product in flasks and pounds with percentage of ore for 17 1/2 years was completed and published in a book called the "Natural Wealth of California," in 1868, but it was incorrect; and, moreover, did not furnish any of the details we now give. In explanation of the table, it may be stated that the "grueso" or first class ore is composed of the largest and richest pieces; the next lower or ordinary grade of ore is called "granza," and the screening and finestuff is called "tierras." These "tierras" are made into "adobes" before being hurled. Under the heading of "flasks from the furnaces" is comprised all the mercury procured in the ordinary way by reduction. "Flasks from washings," indicates the amount of quicksilver obtained from under old furnaces, and about the works at different times, and from the leakage of imperfect furnaces. The amount obtained in this way is quite large. The other columns explain themselves. The mine has been run by the present company, since the first of November, 1863.

The solution of this whole question of high price of quicksilver is seen under the heads of total flasks produced, and percentage of ore. It will be seen that the product has steadily decreased of late years, as has the quality of the ore. In 1850, and 1851, the ore yielded 36.74 per cent. and in 1873 it yielded only 4.87 per cent. In 1867 the mine produced 47,194 flasks of quicksilver, and last year it produced 11,042 flasks. This mine, producing by far the greater proportion of quicksilver in the United States and falling off in its product, while the demand has increased, in even greater proportion than the supply has decreased, furnishes a solution of the whole question to any reasonable mind. Why quicksilver has varied in price is shown in those two columns of figures to which we refer.

The Mechanics' Institute.

The industrial exhibitions held in this city, under the auspices of the Mechanics' Institute, have always been the most successful affairs of the kind on the Pacific slope, and the announcement that another is to be had, is gratifying to every one. The Ninth Industrial Exhibition will open on the 18th of August next, and continue for thirty days. The Board of Managers invite all those interested in the material industries to prepare such productions, natural or otherwise, as may be desirable to exhibit at the fair. They intend constructing an exhibition building having an area of 15,000 superficial feet of floor-room, with a degree of convenience and magnificence never before attempted on this coast. The location of the building is immediately opposite the new City Hall. It will run the whole length of the east side of Eighth street, between Mission and Market.

The exhibition is open to all the world, and all exhibitors are placed on the same footing. Motive power will be furnished free of charge. Bands of music will be in attendance, and the building will be well lighted both day and night. The managers request that persons desiring to exhibit will present their applications at as early a day as possible, addressing their

applications to the "Secretary" of the Board of Managers, Mechanics' Institute, No. 27 Post street, in this city. The following gentlemen are prepared to give any information required concerning the coming exhibition: A. S. Halliday, 113 Pine street; James C. Patrick, 122 Battery street; Henry L. Davis, 421 California street; H. W. Jones, 612 Clay street; Asa R. Wells, Mechanics' Mills; B. P. Cornwall, Spear street, corner Harrison; Chas. E. Elliott, 516 California street; George Spaulding, 414 Clay street; Richard Savsge, 138 Fremont street; A. S. Iredale, 957 Mission street; J. H. McDonald, 217 Spear street; J. P. Curtis, 320 Jackson street; and R. B. Woodward, Woodward's Gardens.

For the benefit of those intending to exhibit, we append the rules and regulations adopted by the Board of Managers of the exhibition.

1. The Pavilion will be open for the reception of goods, on Monday, August 10th. The Exhibition will be open to the public on Tuesday, August 18th, at 11 o'clock, A. M.

2. Applications for space must be made on or before July 20th, stating character of exhibit, amount and kind of space required—wall, table or floor. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have been registered by the Reception Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the Exhibition.

4. The name of every article must be attached by the exhibitor to it, and filed with the Board of Managers.

5. In case of any misunderstanding, application may be made to the Manager of the day, who will at all times be in attendance.

6. Articles intended for sale will be labeled accordingly, but can not be removed until the close of the Exhibition, except by written permission of the Managers.

7. Steam-power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will be given to exhibit working machinery to the best advantage.

8. Perishable articles will be received, or may be removed at any time during the Exhibition, with the consent of the Managers.

9. The most effectual means will be made through the agency of the police and otherwise, to guard and protect the property on exhibition, and it will be the purpose of the Managers that all articles shall be returned to the owners without loss or injury. Still, all articles will be at the risk of the owners.

10. Articles intended for exhibition must be entered and placed on exhibition on or before Friday, August 21st.

11. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to the exhibitors must be marked: "Managers of Ninth Industrial Exhibition, San Francisco, Cal." Articles from foreign countries should be accompanied with a certificate by the American Consul, in order that, upon their arrival, the proper course may be taken to have the duties remitted. All articles thus received, arriving too early, will be stored, free of cost, to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the Manager; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of return of goods exhibited.

Information will be furnished on addressing "Managers of the Ninth Industrial Exhibition, San Francisco, Cal."

The New York Hill mine, owned by A. Delano, of Grass Valley, struck a splendid lead this week, after a great deal of time and money had been spent on the claim. The extent of the strike is more fully noticed in our "Mining Summary."

Bad weather retards mining operations in Alpine county as well as other localities.

Remarks Suggested by Dr. J. E. Gray's Paper on the Stick Fish, in "Nature," Nov. 6th, 1873.*

[By ROBERT E. C. STEARNS.]

At a meeting of this Academy on the 31 of February 1873, certain stick-like rods being the axes of some polyp-form, as well as the general characters of Alcyonoid Polyps were considered and discussed for the purpose of tracing by analogy and determining the relations and position of the specimens under consideration at that time, and it may be remembered that a paper was read, in which was given at considerable length a resumé of what had appeared in the columns of "Nature," in the way of notes and comments by several learned gentlemen.

These rods, switches, or wands, as the specimens had been variously called, were first brought to the notice of the Academy on the 5th of June, 1871, when specimens were presented to the Museum, and so far as an opinion was expressed at that time in a general way, the specimens were placed near the group to which it has been subsequently proved, that they belong.

On the 4th of August, 1873, Dr. James Blake submitted an entire specimen of the polyps of which the rods, etc., are the central stalks or axes, that is, one of these rods or switches was presented by him, with the investing soft or fleshy covering, which proved it to be either a *Pavonaria*, or closely related to that genus. Accordingly, I published a description placing it in the genus *Pavonaria*, and gave it the specific name of "Blakei" (*Pavonaria Blakei*) and the same was printed in the MINING AND SCIENTIFIC PRESS of this city, August 9th, 1873.

Before the succeeding regular meeting of the Academy, which took place August 18th, 1873, through access to more recent literature hearing on the subject, I perceived at once that not only was the species new, but that its separation generically was warranted, and the sub-genus *Verrillia* was made by me to receive it, and a description of the genus and species was read at that meeting and printed copies of my paper (dated Aug. 20th) were sent to various authors, societies and scientific journals in advance of the regular publication of the Academy's Proceedings.

Among the many scientific gentlemen who had discussed the character and relations of the so-called switches, Dr. P. L. Sclater of the Zoological Society kindly gave publicity to *Verrillia Blakei* in *Nature* for October 9th, 1873.

In the same journal of date Nov. 6th, 1873, Dr. J. E. Gray, of the British Museum, publishes a communication "On the stick-fish, (*Osteocella septentrionalis*), and on the habits of sea-pens," in which he refers to a specimen presented to the Museum by Mr. Cooté M. Chambers, and of which he says: "Unfortunately the specimen did not arrive in a good state for exhibition. The greater part of the animal portion had been washed off, probably by the motion of the solution during the transit; only about a foot of the flesh which was loose on the axis, and the thick, swollen, naked, club-shaped base, without polypa remained; but it was in a sufficiently good state to afford the means of determining its zoological situation and of examining its microscopical and other zoological characters."

In the next paragraph, of which I quote a portion, Dr. Gray says: "Mr. Chambers' specimen is the animal of the axis or stick, that I described as *Osteocella septentrionalis* (Ann. and Mag. Nat. Hist., 1872, ix. p. 406). * * * * and is evidently the same animal as *Pavonaria Blakei*, described by R. E. C. Stearns."

"Two days after I received this specimen, I received by post, Mr. Stearns' description of the stick fish (*Pavonaria Blakei*), from the San Francisco Mining and Scientific Press, August 9th, 1873."

Towards the close of his article, Dr. Gray writes: "Mr. Stearns' paper, in the Proceedings of the California Academy of Sciences, is a re-print of the paper in the San Francisco Mining and Scientific Press, with a few additions, and the addition of a new sub-genus, *Verrillia*, although he quotes *Osteocella*. "To this paper, Dr. Gray gives what he considers "the synonymy of those animals;" first, the genera, and next, the species; placing my first generic determination, *Pavonaria*, and my subsequent sub-genus, *Verrillia*, in the order as recited, as synonyms of his genus *Osteocella*.

While asking Dr. Gray by what warrant either of science or justice he places *Pavonaria* or *Verrillia*, definitely described genera, as synonyms of his indefinite and vague *Osteocella*, which latter he publishes as a genus, for it can not be said he describes it, in the "Catalogue of Sea-Pens—or Penatulidae—in the British Museum" 1870, page 40. Gray's genus *Osteocella* is based upon a "bone," (probably the axis of a polyp), which was sent to the British Museum "many years ago," from Australia, by a gentleman named Clifton. The investing fleshy substance, or soft portion of the animal, of which said bone formed a part, had not been seen by Dr. Gray at the time he invented the name *Osteocella*, and even to this date no additional light has been furnished by him regarding the Australian form. He was not even positive that the "bone" belonged to a zoöphyte, for he says: "or, it may be the long conical bone of a form of decapod cephalopod which has not

yet occurred to naturalists, as Mr. Clifton spoke of its being a free marine animal it has a cartilaginous apex like the cuttle fish."

In which of the great divisions of the animal kingdom does Dr. Gray place it, or did he place his Australian bone in 1870?

Courtesy and fairness suggest that as he

How the Eucalyptus Should be Planted.

In answer to many inquiries from all sides concerning the Eucalyptus, in which so much interest is shown at present, Dr. William H. Gibbons, of Alameda, has kindly furnished us

PROPER AND IMPROPER CULTURE OF THE EUCALYPTUS.

EXPLANATION OF ENGRAVINGS.—Figure 1 represents the tree which has been raised in a pot or box, with its halled roots thrust in the ground, just as they sometimes come from an inexperienced nurseryman. Figure 2 represents a tree resulting from such improper planting, top-sided and ill-shaped. Figure 3 shows one properly planted, with suitable excavation filled with mold at the bottom. Figure 4 exhibits the result of proper culture—a symmetrical, shapely tree.

printed it in the Catalogue of *Penatulidae*, it should be conceded, as I have written, in a previous paper, "that, in his mind, the balance of reasoning tends in that direction."

Admitting this latter, what then? The Australian bone upon which rests his genus *Osteocella* is described by Dr. Gray as being "thick, about eleven inches long, tapering at each end." Subsequently he has received one of the stalks, or axes, of what I have named *Verrillia Blakei*; of the latter he says, it is "long, slender, about sixty-four inches long, attenuated at the base, and very much attenuated and elongated at the other end." "Mr. Carter" examined both of the bones referred to, microscopically, and "finds them" to "present the same horny structure," etc. An examination with acid was made, but as it would be rather difficult to comprehend in what way generic or specific determinations within any related groups could be determined by acid, this test may be allowed to pass.

The reference of *Verrillia* to *Osteocella* as a synonym, or otherwise, must rest on this microscopic test, as the soft investing portion of the animal, the perfect or complete polyp or polypidom of the Australian form, to which the bone, if the axis of an alcyonoid belongs and upon which Dr. Gray made his genus *Osteocella*, has not, as yet, been seen by him, or brought under scientific observation. He can not aver, because he does not know but that it may be a species which belongs to some genus already described, or that it may properly fall in as a sub-genus of some of the genera of Alcyonoids previously known; he does not know but what its relationship may be nearer to any of the other groups than to *Pavonaria*. No description sufficiently accurate to be worthy of consideration, can be made from the axial rods or bones alone, of this class of animal forms, nor can species be satisfactorily determined without the fleshy portion; nor, in the present state of our knowledge, can the microscope determine these points.

In his genus *Osteocella*, which it must be borne in mind, rests solely on the naked Australian bone or axis, which he says is "thick," "eleven inches long," as published in the British Museum Catalogue of *Penatulidae*, no information is furnished as to the soft investing portion, for the very good reason that it had not been seen by him; yet in the number of *Nature* last quoted, he speaks of "the complete polyp-mass," thus clothing his west Australian *Osteocella* with the fleshy covering of the west North-American *Verrillia*. So much for his generic synonymy. As to the species, the North-American form, as referred to by him, could not be definitely placed, by anything written by Dr. Gray prior to the date of my description.

This is a matter, not of personal pride, but of scientific accuracy, and scientific naturalists should not lose sight of, or be diverted from this *sine qua non*, or palliate individual idiosyncrasies, which involve integrity, and which should not be allowed to pass without challenge or comment.

*Read before the California Academy of Sciences, March 16th, 1874: Figure 1 of the cuts, shown on this page, gives the general appearance of the zoöphyte, reduced to one-twelfth natural size. Fig. 2 shows a section across polypiferous portion, natural size.

The Hollister Enterprise of the 14th says that the Cerro Bonito Quicksilver Mining Company is taking out some very fine cinchabar. It is working from forty to fifty hands at the present time, and intends to increase the force to 150 during the coming summer.

with the following hints concerning its growth: The habits of the trees, like the habits of animals, differ. The full development of any

Fig. 1.

Fig. II.

ALCYONOID POLYPS.

organized structure depends on the being placed under conditions which best coincide with its natural habits. Our common oak (*Quercus Alrylops*), scarcely ever attains a height exceeding fifty feet. It has no central axis, its numerous branches are regularly uniform in size,

and singularly erratic in regard to direction. You cannot train one of these trees when a sapling, and make it assume the form of a chestnut, a poplar, or an Eucalyptus. Nor can you trim an Eucalyptus and make it assume the form of an oak. The roots of different trees also vary in direction, in depth and in bifurcation, according to the soil in which they grow. By nature, the relation between the form and mass of a tree and of its roots, as a general rule, is uniform. Should there be deficiency or poverty of soil, neither root nor top is developed. Should the trunk be deprived of its small branches and leaves, there follows a deficiency in the new wood of the tree, which is apt to be brittle and succulent. Again, a young tree has more rapid growth of root, than of top. But the root derives its pabulum from the leaves which prepare, or assimilate the sap. Whatever deprives the young tree of its natural proportions of leaves, interferes not only with the growth of the tree itself, but with the extension of the root. Whatever impairs the growth of the root, impairs the general health and vitality of the tree.

The Eucalyptus, in its natural localities, attains a height of from 300 to 400 feet, with a diameter of 40 feet. Its first two years' growth from the seed is largely occupied in making root. Cut off its side branches; and you cut off the organs which supply the roots with food. Dwarf the root, and you produce a tree, ill-shaped, ungraceful, which having no firm support in the ground is liable to be blown over by any high wind.

There is too much carelessness on the part of some, too much ignorance on the part of others, in transplanting and cultivating trees; our gardeners ball up the roots of our Eucalyptus like a mass of worms, and sell them thus, ready for planting. Many purchasers dig a small, shallow hole and set the trees in just as they bring them from the nurseries and cover them up. They grow, but having no extension of root, and no more depth of soil than the gardener has depth of brain, they grow until a heavy wind comes round and blows them over. They are re-set, their tops are cut off and they grow again, looking as much like an Eucalyptus as a jackass does like a philosopher. The hole for a tree should always be from 18 in. to 2 ft. square and of like depth; it should be filled to within 8 inches of the top with good vegetable mold or compost. The root should be trimmed so as to leave no accumulation of twisted roots, and the tree then planted so as to be about one inch below its earth line. So planted, it cannot fail to grow, and with ordinary care it will never blow over. By reference to the accompanying engraving the reader will be able to see the difference between the growth of a young tree planted properly and left to nature, and one planted according to prevailing custom.

[We think the Doctor is a little too severe on a majority of our nurserymen and gardeners. Many of them are wiser now-a-days—Ens. Press.]

RAITISH COLUMBIA MINES.—The "Clean-up," for the week ending March 16th, at the Lightning creek mines, B. C., were as follows: Spruce mine, 96 ounces; Perint, 72 ounces; Van Winkle, 130 ounces; Victoria, 90 ounces; Vancouver, 332 ounces. The Vulcan company struck slum in their shaft last week, and there were fears that they would lose the shaft, but by great exertions they managed to save it.

THE PAUL PROCESS.—The Miners' Foundry are now getting up a large mill for the Silver Sprout Mining company, of Inyo county, California. The machinery is adapted for working the wet silver ore of the mine by Paul's Dry Process. This company have tried pan and furnace working, and have concluded that the Paul system will prove the most profitable to them.

An immense cave occurred in the hydraulic claim of Veith & Co., in Tunnel Ridge Calaveras county, last week. About thirty feet in thickness of the bank, which is from eighty to one hundred feet high, came down like an Alpine avalanche, completely burying the "Little Giant" nozzle and a portion of the pipe.

The \$20,000 suit of Knox & Osborne against the Phoenix Mining Company, for furnaces supplied, was last week compromised by the defendant paying \$8,000. The company claimed damages over the amount plaintiffs sued for, alleging that the furnaces were improperly constructed and leaked quicksilver.

MINING ACCIDENT.—A man named George Williams was killed in the Oregon shaft, Austin, Nevada, on Monday, by falling from the 500-foot station.

The Owyhee Avalanche states that the mining prospects in Idaho were never better, and predicts a splendid turn-out of the precious metals the coming season.

One hundred men are employed at the California Powder Works at Santa Cruz. The company are making and selling large quantities of powder of different kinds.

The snow slides in the mining cañons in Utah, are of almost daily occurrence, rendering travel exceedingly dangerous.

A MINERS' Union was organized in Lynn county, Nevada, last week.

The Esmeralda.

The *Alpine Miner* gives the following description of the Esmeralda mine, upon which work has recently been started up:—It is always our intention and desire to keep the public advised in respect to what may from time to time be transpiring in the mining business in our country—an industry in which many of our people are bending their energies and staking their hopes of ultimate reimbursement for large outlays in the prosecution of this alluring and intoxicating pursuit. But we have been remiss in the particular of the recent commencement of work on the Esmeralda claim—a mine which has long been considered one of the most valuable in Monitor district, and which years ago gave evidences of extreme richness of ore. The Esmeralda adjoins the Silver Glance mine. It was located in 1862, as Esmeralda No. 2, the Silver Glance property being recorded as Esmeralda No. 1. The original locators were John D. Marks, Jacob Braudeberry, Warren Burright, Frank Lang and David Warwick. The mine is now in the control of David N. McBeth and Thomas Leggett. Several weeks ago men were put on and did considerable preparatory work, but the severity of the winter was such as to induce suspension of operations, but since the weather has permitted, active prosecution of the work has been going on at the Esmeralda. Already some thirty feet of shaft has been sunk in hard rock, and indications of a flattering character brought to light. A first-class gang of miners are employed, and "go ahead" is their watchword as well as instructions. McBeth has the superintendency. "Old Bob Turner," as his friends like to call him, an experienced miner, is his foreman, while the heavy men on duty are Joe Soper, Billy Ward and Harry Hilton, —all bang-up miners. We understand that this start-up means business, and we must wish the enterprising owners a full measure of success. We just now learn that another shaft will be put on at an early day.

Since the above was written a gentleman has handed us these additional particulars: At the bottom of the shaft, as abandoned in '63, Mr. McBeth took out samples of ore that assayed \$86 73 per ton. Since then some ten feet have been sunk, and assays this week show \$149 31. The ledge is large, well defined, and can be traced the whole length of the Esmeralda location. It is intended to sink 100 feet, and then drift east to the wall-rock, which is a well defined porphyry. It is the opinion of experts that the great ore body will be found adjacent to this wall, as is the case in the Tarshish.

Capitalists from Virginia City have their eyes upon this mine, and if the showing at 100 feet is proportionately as favorable as since work started up, all the capital wanted for the extensive and complete development of the mine will be forthcoming.

PUREIT OF KNOWLEDGE UNDER DIFFICULTIES.—The Nevada Transcript, having had some difficulty in obtaining mining intelligence, expresses a determination to get at the facts in some way. It says: Our people want to know what is going on in that branch of business, and capitalists want to know, in order to find a place to invest their money. * * * One of the highest Courts in this State has decided that a local reporter can visit any place in search of items, without having the least suspicion cast upon him, if any wrong has been done. So, readers, we shall act upon the presumption that we have a right to go into diggings and try and find out how they pay. Miners have the strangest ideas of a reporter in search of items, of any class of persons we come in contact with. Some say, "I don't want you to say anything about my claims, if you do, people will think I want to sell, and I don't want to do any such thing." Others—"Well, now, look here, reporter, I don't want my diggin's puffed up; it's my private property, and its none of anybody's business whether I am making one dollar or one thousand dollars per day." Others—"I don't want anything said about my diggin's, if you do, all my creditors will be after me for their pay, when I am trying to pay them as fast as I can; but they will expect more from me, and if they don't get it, they will say I am squandering or sinking it for future use." Others—"It won't do, for you only advertise my claims for the benefit of robbers." Others—"Well, don't say anything just now," and giving a sly wink, as much as to say, "the Assessor will be around shortly, and he will assess our claims like thunder, if he sees the account of how much they are paying." Others—"I don't want to see my name in print." These, and a thousand other reasons are given why we should not publish mining items. We will take none of these excuses hereafter, and shall endeavor to get every mining item we can.

ONE of the infinite variety of swindling dodges is now being tried on many a Yankee inventor in the shape of a circular from a fictitious "Mississippi Valley Manufacturing Company," of Vicksburg, desiring to buy the right to manufacture his invention for the trade of the South; offering him very advantageous terms, and requesting five dollars to help pay for examining the patent. The fraud is transparent.

A WIRE rope is being manufactured at Wilkesbarre, composed of six strands of nineteen wires each, and which, when completed, will weigh twenty-two and a half tons. It is two and a half inches thick, and will be over a mile long.

Quicksilver Mines.

The Vallejo Chronicle has the following: Calistoga is highly excited over cinnabar. From one end of her limits to the other, one hears nothing but cinnabar, cinnabar, cinnabar. The men talk of nothing else, neither do the women; and the children discuss the subject with the same voluble earnestness as the old folks. All are, of course, deeply versed in the geological phase of the subject, and rattle off ponderous technical phrases with an ease which to the stranger is something more than astonishing. It is needless to state after this, especially to those who are acquainted with the operations of mining excitements in California, that Calistoga is rich. All of her citizens of high and low degree are rolling in (prospective) wealth. Mr. Fisher remarks with reference to the new born millionaires who make up the population, that "you can't now judge of a man (financially) by the clothes he wears." Perhaps one of the worst dressed you meet has a claim, which, in a short time, will make him one of the blindest of capitalists. The stranger will not proceed out of Calistoga but a few miles before he will see the landscape dotted with prospectors, each with his little hammer pegging away industriously and enthusiastically at some geological formation imagined to contain cinnabar. One of the hotel proprietors of the town who has caught the fever, is negotiating a "dicker" by which he is to part with his establishment for a cinnabar mine. Calistoga is the great center of operations for the whole surrounding district, and is the great rendezvous of prospecting expeditions. Naturally, therefore, the aggregated excitement of the whole section is all focused in this spot; so that it is no wonder the little village is red hot on the subject. The mineral region of which we are speaking is, as far as is shown from present prospecting, from three or four miles wide, to fifty miles long. That it is an extremely rich section, abounding in mineral wealth, with many good mines, there is no question.

Pine Flat.

Pine Flat is the name of the mining settlement which has grown up since last November, and now lays claim to the dignity of a town. Pine Flat is situated on the Geyser road a few miles from Calistoga; there are some ten buildings in the place, of which there are one store, two saloons, two blacksmith shops and one restaurant. Some of the best mines of the district are located within a few yards of the town.

Missouri Mine.

This is one of the most promising mines of the district, and is owned by Mr. Wm. A. Stuart of San Francisco; a tunnel has been run in over seventy feet at which distance the ledge containing the cinnabar is struck. The correspondent of the *Napa Register* says the view of ore where it is exposed by the tunnel widens out "to one solid body of ore, and ore that exceeds any I have ever seen." This mine can safely be put down as the banner mine of Cinnabar District. Under its present able management it has been a success. Less than \$5,000 has been expended to date, and over \$3,500 worth of quicksilver has been taken out in less than three weeks." The monthly product of the mine is fifty flasks of quicksilver. They have only two small retorts but will soon put up three more; some fifteen persons are employed at the mine. One day last week 800 pounds of fine looking ore were placed in the retort as it came from the mine and produced 128 pounds of metal.

Miscellaneous.

The entire product of quicksilver of all the mines of Napa and Lake, including the Redington, is estimated to be about 1,200 flasks per month. The product of the Redington alone is 500 flasks per month.

On Friday last one shipment of quicksilver from the Redington passed through Vallejo to San Francisco, which was valued at \$10,000.

The famous Rattlesnake mine at Pine Flat has been bonded for a short time for \$52,000.

Mr. Clark the superintendent of the Sonoma, was one of the original locators of the Redington mine.

Mr. John Neat of the St. John Mine of Vallejo, returned Saturday evening from a week's tour among all the mines of Lake and Napa county. Mr. N. is satisfied from what he saw that the Vallejo mine is second to none worth of San Francisco.

AUBURN MILL COMPANY.—We understand that the Auburn Mill Company have made arrangements to secure a regular supply of high grade ores from the Dayton Gold & Silver Mining Company, Silver City, and from a series of mines at Terrace, Utah, owned by Thos. H. M. Winn & Co. Being so far removed from its source of supply this mill has heretofore labored under many disadvantages, but from present indications their liberal terms offered to mine owners have secured for them the prospects of a most successful business during the season. This will add greatly to the general prosperity of Reno, and prove that, with good management and fair dealing, this property may be made profitable to its managers.—*Nevada State Journal*.

A CONTEMPORARY states that balky horse may be overcome in the most perverse fit of obstinacy, if a rope is passed under the belly and sawed gently across the inside of the fore-legs. Upon feeling the rope, the horse takes a step or two forward, and a little more sawing sends him ahead all right.

Sponges.

Sponges are the active eliminators of the salts of the ocean. In a large laboratory certain substances are kept in solution so as to be ready to the chemist's hands. Nature's grand laboratory is the sea. There her little economic chemists are ceaselessly busy extracting and putting into solid forms, the various mineral substances held in solution. Thus the coral polyps eliminate the carbonate of lime with which to build their beautiful structures. And the Alcyonarian polyp in this way builds up the delicate sea-fan, with its skeleton of keratose, or horn-like substance. And so it is with the sponges. They, too, are elaborators of the mineral treasures of the sea. Hence it has been attempted to group them upon considerations of their special building propensities. In this way the toilet sponges, and in general, those of commerce, which all affect horn or keratose, in the structure of their skeletons, would be grouped together as the Keratosa, while those which choose lime would be called Calcareia; and those which build up with silicea would be known as Silicea. We have mentioned these groups in their order of rank. The highest is the vitreous, or glass sponge.

It is amazing that a creature so simple that it has been called structureless, should surpass all other organisms in its capacity of rearing exquisite fabrics. And, now that we have had time to sober down a little in our raptures over its structural beauty, and, so to speak—like one that has passed from the pleasant contemplations of art to the graver meditations of philosophy—to listen with composure to its deeper teaching, we find it casting new light upon the inquiries of science—even lifting a corner of the veil of the covered past. So little, until lately did we know about the glass sponge, that were like the purblind pre-historic man, working patiently at his flint nodule, to fashion it into an implement for use, little dreaming that some glass sponge had been the ancient eliminator and conservator of the solvent silicea of the sea, and had, through subsequent geological action, preserved its skeleton for the service of that ruder artisan. What a freight of precious knowledge will that be when the good ship Challenger shall have returned from her four years' dredging around the world, among that newly-opened "Abyssal Fauna," whose province covers 140,000,000 square miles beneath the blue mantle of "the myriad smiling sea!"

MINING SUIT.—Peter Winants has instituted suit in the United States Circuit Court against John Whalen, D. W. Taylor, T. W. Tripp, Robert Hanuegan, M. Gately and the Bandarita Gold and Silver Mining Company. He alleges that on the 12th of July last he was the owner and in possession of the Eclipse mine and mill, on the Merced river, in Mariposa county; that a few days afterwards he made an agreement in writing with the personal defendants, constituting them his agents, and authorizing them to organize and incorporate a company to be known as the Bandarita Mill and Mining Company. The capital stock was to consist of 20,000 shares of the par value of \$50 per share, and according to the averments in the complaint of the plaintiff, were authorized by the terms of the agreement to subdivide and use as many shares of the stock as might be found necessary to raise funds to develop the mine and make it self-sustaining, and the remainder of the stock was to revert to the plaintiff. Winants further alleges that in pursuance of this agreement the company was incorporated, the stock was issued in his name, and he donated 4,000 shares of it to the company to be sold at not less than one dollar per share, the proceeds to be used in developing the mine. The defendants were made Trustees of the company, Gately being President and Tripp Secretary, whereupon the plaintiff confided to the care and custody of the defendants, the remaining 16,000 shares of stock to be held and retained for him until the mine was developed and made self-sustaining. Plaintiff alleges further that the sale of the 4,000 shares realized a sum sufficient to develop the mine, and ever since September it has been self-sustaining. He alleges that the defendants confederated to convert his 16,000 shares of stock to their own use, and being a majority of the Board of Trustees, caused new certificates of the stock to be issued to themselves and to be entered on the books in their own names and those of their associates, for their own use and benefit; wherefore the plaintiff prays for a decree declaring him the owner of the stock and commanding the defendants to surrender it to him, and that, pending the suit, they be enjoined from making any entry or transfer of the certificate on the books. He also hints at further general relief from the Court.

It appears from experiments made in St. Petersburg that, contrary to the opinion generally entertained, gold coin wears away faster than that of silver. Twenty pieces of gold half imperials and as much of silver coopeks—coins of about the same size—were put into new barrels, mounted like churns, which were kept turning for four hours continuously. It was then found on weighing the coins that the gold ones had lost sixty-four grammes—the silver ones only thirty-four; but as the number of gold pieces was 28 per cent. less than those of silver, the proportion is of course greater to that amount in favor of the latter. The silver also contains more alloy than the gold.

The Stickeen fever has reached Idaho, and a number of miners are preparing to take their departure for the newly-discovered gold fields.

Hydraulic Diggings.

The Sierra Nevada company are now engaged in running a tunnel into Cedar Hill under the large gravel deposit near their old works. The tunnel starts in below the Geiger grade, and will pass about ten feet underneath the basin of the gravel deposit. It is being made large enough to admit of a string of large sluices being placed in it, and these sluices will be provided with undercurrent and all the latest California improvements in hydraulic mining, with arrangements for saving all the quartz there may be in the dirt washed. Although called a gravel deposit, the rock shows but little indication of a "wash," all being in angular fragments and more resembling the debris of a big slide from the hill; though Cedar rapids may at one time have passed along where the deposit is now found. About 150 inches of water will be used in washing the bill, and this will be sufficient to bring down everything and do great execution. The ground is known to be very rich, and in early days paid immensely with but twenty or thirty inches of water. When the present owners get to work with 150 inches of water, they expect to lay bare the bedrock the whole side of the hill. Thus will doubtless be discovered some rich pockets of quartz. They expect to be ready to commence operations about the middle of April. When they start 150 inches of water down the cañon there will be a chance for others to work gravel deposits below, in the banks of the ravine, wherever it will not interfere with the rights of the mill-owners. If there should not be sufficient gold to pay for working, there must be, in places beyond Six-mile cañon, some big deposits of quicksilver and amalgam. As Six-mile cañon was the favorite stamping ground of Jack Davis and his band of stage robbers in the early days, a silver brick might be turned up occasionally.—*Virginia Enterprise*.

Corundum.

This rare and valuable mineral is found in but few localities. As it is the hardest known substance, with the exception of the diamond, it has always been in demand for the purpose of cutting and polishing precious stones.

Corundum is an almost pure, crystallized oxide of aluminium. It gradually passes on the one hand into the sapphirine and ruby, which are pure and translucent, and on the other into emery, which is massive and generally contains magnetite and other impurities.

The principal mine of this substance is in Newlin, Chester county, Pennsylvania. This locality was discovered by L. W. Williams about forty years ago, and was afterwards worked by him to a considerable extent, until the vein gave out. Many stray holders of the mineral were also gathered up and shipped to England, where Corundum is used for cutting plate-glass. Among those boulders was one specimen that weighed between four and five thousand pounds. At various times since that date, different parties have prospected in that neighborhood for another vein that would pay for working, but with small success until last September, when a large vein was struck.

The vein is extremely difficult to work, from the great hardness of the mineral. Drills will not touch it, and sledge-hammers last but a short time; it is therefore worked by taking advantage of the natural seams and crevices in the rock. It is worth from three to five hundred dollars per ton, delivered at the railroad station within half a mile of the mine.

DESILVERIZATION OF LEAD.—A process for the desilverization of lead by zinc has been described by E. Kocb in the *Berg-und Huettenmaennische Zeitung*. In order to make the process a continuous one, the author liquates his lead from copper in a reverberatory furnace with an inclined hearth. The liquated lead is received in a Pattinson kettle, which when it contains a charge is emptied by a syphon tap into a lower kettle. In the second kettle the antimony is oxidized by steam, and the lead then syphoned into the lower kettle, where it is desilverized by zinc, the latter being fastened in front of the lower mouth of the syphons, so as to bring it into intimate contact with the lead. The desilverized lead is then syphoned into a still-lower kettle, where the zinc is removed by steam and then syphoned into a still lower kettle, whence it is syphoned into iron moulds. The advantages claimed for this method of plant are, a more perfect utilization of heat, greater production of metals before the addition of zinc (i. e., copper and antimony), saving in the amount of zinc, less wear of kettles and a more suitable shape of these last.

THE PORTLAND STRIKE.—There can be no better proof of the reality of an alleged strike than to see the ore. Seeing is believing and if there are any who are incredulous in regard to the late strike in the Portland mine, they can satisfy themselves and receive an ocular demonstration of the reality, by visiting the dump, upon which there are now 20 tons of ore of the new strike. The stock of this company is still on the rise. Pioche owners of Portland stock are holding it firm.—*Pioche Record*.

FLOWERY DISTRICT.—Preparations are being made to resume operations on several mines in this mining district this spring. Such mines as work shall be resumed upon, will be opened in accordance with the light of the present times, not in the bungling style in vogue in the early days.

Inland Navigation in Japan.

Quite a considerable number of the rivers of Japan are navigable for short distances by vessels of light draught and small dimensions, and the Japs are not slow in introducing steamboats wherever practicable. Of course these Lilliputian leviathans are of the cheapest and flimsiest style of naval architecture, and quite in accordance with the usual baby-play style of things in use by the natives. On Lake Biwa, at the present time, no less than seven steamboats ply between various points. One of them is so small that the "saloon" cabin is but ten feet long, six feet wide and three feet high. A platform occupying half the saloon and covered by a rug, is "first class," the matted floor is "second class," while a sort of black hole in the "forecastle" is assigned to "third class" passengers. The cabin is furnished, beside the rug and matting, with a once handsome mirror, two feet square, with the gilt rubbed off. The host, in spite of its gorgeous mirror, is not calculated to soothe nervous people, as it has the heart disease badly, i. e., the boiler leaks in several places, and the machinery jars and wobbles, in a manner more lively than secure. In fair weather, the length of the lake, about 54 miles, is made in eight or nine hours. When contrary winds blow, two days are required. It is not wonderful that such steamers come to grief occasionally. Though the way is smoothed for explosions, yet a genuine blow-up is shy of intruding itself upon the owners of such craft; or, if victims lose their lives, we do not hear of them.

The oft-repeated assertion (by themselves as well as others) that the natives of Dai Nippon are a brave people, seems to have some truth in it, when we consider with what nonchalance they go on board of these floating traps; and the perfectly native manner in which the Japanese play with steam, and machinery forces the suspicion that they do not consider themselves highly civilized unless they have a few first-class explosions. If there is an inspector of steam-engines and boilers in Japan, we have not yet heard of him.—*Japan Gazette*.

ROBINSON DISTRICT.—J. R. McCreary, a miner of long experience, just in from Mineral City, talks very hopefully to the *White Pine News* of the future of Robinson District. He has been employed for a long time in the Antman mine, of the Canton company, and says the property never looked better than at the present time. Experimental assays have been made during the winter from every portion of the mine showing mineral, as also of other locations, belonging to the company with splendid results. The average of all the samples is said to be \$64 in silver, and from \$60 to \$100 in gold. The latter result is not over estimated, of our own knowledge, as we have witnessed the "panning out" of a small lot of dirt taken from the dump, which averaged 30 cents gold to the pan. It is expected when the season is further advanced, work will be resumed on this property, under different management from that of last year, when splendid results may be anticipated. A company, owning such valuable mine as does the Canton, should not allow the same to remain idle when success is to be obtained by working. Mr. Underhill is now in charge of the company's works, but nothing is being done at present. It will be a matter of impossibility to do much in the mining way at Robinson until May, as weeks of fine weather will be necessary to get the roads in good order and condition; meanwhile ore will constantly be taken out by the various companies engaged there.

FLY BLOW.—It is a common idea that the appearance of maggots in meat, cheese, etc., is the cause of the taint which is always found when they present themselves; but it is just the contrary, for the odor caused by the commencing decay is that which guides the parent insect to the depositing of its eggs in situations where its offspring will find congenial nourishment, and where they will exert a beneficial influence by reconvertng into a living structure much that would otherwise pass into utter decay, and by thus diminishing, if not entirely checking, the obnoxious effluvia that would be given off during the process. The voracity of these larvae is enormous, and the rapidity of their growth and complete development is most wonderful. They have been found to increase in weight as much as two hundred times in the course of a single day, and a few days are sufficient for them to go through all the stages of their growth and transformation, and to produce another generation. Three flesh-flies and their immediate progeny (each female giving birth to at least 20,000 young) would devour the carcass of a dead horse with greater celerity than a lion would accomplish the same feat.

WATERPROOFING BOOTS.—Paraffine is recommended for this purpose in an English journal. The writer says: "Melt thoroughly the paraffine, and, having well warmed the boot, apply the paraffine with a brush or piece of flannel before a fire, to allow of the leather absorbing the liquid. I have tried the above, and it answers admirably, resisting snow-water during a week's shooting."

AUSTRALIAN METHOD OF COOLING WATER.—The water is placed in large cloth buckets 1.2 metre deep, and 0.4 metre diameter, covered with a flannel strainer, and furnished with a siphon and cock for drawing off. The bucket is hung up in a tree in a shady place, and the evaporation from the moist surface cools the water several degrees below the air.

SCREW PROPELLERS.—The report of Mr. W. C. Seldea, Chief Engineer of the Navy, considers, among other things, the question of screw propellers, and embodies the results obtained in certain changes made in the screws of vessels—from four to two blades—with a view of rendering such vessels more efficient when under sail alone. With equal propelling surfaces it has been determined that no advantage whatever can be derived from using a screw of two blades, instead of four, when sailing; because when screws are uncoiled and revolving freely, those of four blades oppose no greater resistance to the vessel than those of two. When fixed and held stationary in a vertical position behind the stern post, the loss of speed, due to the resistance of the screw, expressed in percentage of speed, has been shown by careful experiment to be 18-20 per cent.; while the four or two bladed screw, revolving freely by the pressure of the water, gives a resistance of only 9-96 per cent., being nearly two to one in favor of the revolving screw. The four-bladed screw also produces less vibration in a ship than one of three, and the latter less than one of two blades. The propelling efficiency of a screw is entirely independent of the number of its blades, but is wholly dependent upon the area, the pitch, the fraction of the pitch used, and the area of the circle described by the blades.

RECENT experiments in England in the preservation of iron surfaces show, it is said, the advantage of coating such surfaces with heavy mineral oil. The action of such oil is said to be two-fold. It is detergent when freely and vigorously brushed over an already rusted surface, seemingly loosening the bulk of the rust, while it also darkens that which remains; and it likewise acts as a varnish if applied after the cleansing has been effected, or to new and bright work. Its superiority to vegetable or animal oils depends upon the fact that the bulk of the oil evaporates, and it leaves only a very fine film behind. If the oil is light, and fully refined, it evaporates so completely as to do but little good in this way; but, if tinged or "once run" oil of sufficiently high gravity be used, the resins or carbonaceous matter which gives the tinge to the oil remains behind and forms the thin protecting film of varnish. Ordinary varnish leaves far too thick and obvious a film, while the film of the once-run oil does its work of protection without displaying itself. As regards the density of the oil required for this purpose, that which stands between the burning oil and good lubricating oil is found to be the best.—*Iron Age*.

A CURIOUS circumstance was noted by an observer, Mr. N. M. Lowe, during the great fire at Boston, last year. He found that at places where a small street entered, but did not cross a larger one, it frequently happened that a current of air was generated, which carried the flames across the wide street at the point of junction, and fired the opposite buildings, even though that whole side of the street except at that point was not effected by the fire. Owing to this, a wide street did not always offer as certain a check to the progress of the conflagration as might have been expected.

THE influence exercised by the moon on meteorological phenomena has been the subject of a communication to the Academie des Sciences of Paris, by M. Maclaud. From examining the distribution of storms between the years 1785 and 1872 he supposes that he detects some relations between the appearance of storms and the age of the moon, and he attempts to show by tables that the moon has an appreciable influence on the temperature and pressure of the air, on the state of the sky and the distribution of rain.

MOTH PREVENTIVE.—The following recipe for keeping moths out of clothing is a favorite in some families: Mix half a pint of alcohol, the same quantity of spirits of turpentine, and two ounces of camphor. Keep in a stone bottle, and shake before using. The clothes or furs are to be wrapped in linen, and crumpled-up pieces of blotting paper dipped in the liquid are to be placed in the box with them, so that it smells strong. This requires renewing about once a year.—*Jour. of Chemistry*.

TO PREVENT WOOD FROM CRACKING.—A correspondent of the *English Mechanic* writes: "Having a great deal to do with the seasoning of the harder and better kinds of wood, I find that they are all liable to crack badly at the ends. I generally give them three or four coats of glue on the ends only, which I find is a sure preventive, till the wood is well dry, and then cut on the quarter."

TO correct the weight of a platinum crucible, Dr. F. Mohr recommends that a brass or leaden weight be prepared a little heavier than the crucible. This is placed on the right hand pan of the balance, and the crucible exactly counterpoised by a rider on the left hand side of the beam. Some advice is also given as regards the correction of the weight of the crucible after the weighing.

IMPROVED UMBRELLA.—A new invention consists of an arrangement of an umbrella top, so as to revolve upon the handle to relieve it when strong gusts of wind blow against it quartering, or when the top strikes against other umbrellas, or other objects in crowded places. The said arrangement consists of a notched revolving ring for the ribs, between two collars on the handle, and a revolving notched ring on the runner, also between two collars.

JUST PUBLISHED.

Froiseth's New Sectional, Topographical and Mineral

MAP OF UTAH.

SIZE, 40 BY 55 INCHES; SCALE, 8 MILES TO AN INCH.

Handsomely engraved on stone, colored in counties, and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SURVEYS made to date. Price, mounted, \$8; Pocket form, \$5.

PAIN-KILLER, THE GREAT **FAMILY MEDICINE OF THE AGE.**

TAKEN INTERNALLY, IT CURES
Dysentery, Cholera, Diarrhea,
Cramp and Pain in the Stomach,
Bowel Complaints, Painters' Colic,
Liver Complaint, Dyspepsia, Indigestion,
Sore Throat, Sudden Colds,
Coughs, &c., &c.

Used Externally, it Cures
Boils, Felons, Cuts, Bruises, Burns, Scalds,
Old Sores, Sprains, Toothache, Pain
in the Face, Neuralgia, Rheumatism, Frosted Feet,
&c., &c., &c.

PAIN-KILLER,
After a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is that its sales have constantly increased and wholly upon its own merits. The effect of the

Pain-Killer
Upon the patient when taken internally. In case of Cold, Cough, Bowel Complaint, Cholera, Dysentery and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, &c., Stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

The Pain-Killer

Derives much of its popularity from the simplicity attending its use, which gives it a peculiar value in a family. The various diseases which may be reached by it, and in their incipient stages, eradicated, are among those which are peculiarly fatal if suffered to run, but the curative magic of this preparation at once disarms them of their terrors. In all respects it fulfills the conditions of a popular medicine.

Be sure you call for and get the genuine Pain-Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine.

Price 25 cts., 50 cts., and \$1 per Bottle.

Sold by all Medicine Dealers.

A NEW BOOK ON MINING.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgist's Companion; comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Compiled by J. S. PHILLIPS, M. E. Price, bound in cloth, \$1.50; in leather, \$12 (currency). Forwarded by mail for 50c. extra. For sale by Dewey & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) need continuously for subsequent volumes. Post paid, 26 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press.

SHAREHOLDERS, TRUSTEES, AND SECRETARIES OF ALL MINING COMPANIES.

Should see to it that their Notices are advertised legally in the **MINING AND SCIENTIFIC PRESS**, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

Due to the time necessary to mail the present large edition of the **M. & S. Press**, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale.
F. N. WELLS, Secretary.
Office, No. 402 Montgomery street, Room No. 23, San Francisco, Cal. m14-4w

Commercial Coal Mining Company of San Francisco.—Principal place of business, City and County of San Francisco, California. Location of works, Santa Cruz County, Cal.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of 3 1/4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale.
S. B. HANSON, Secretary.
Office, No. 402 Montgomery street, Room No. 23, San Francisco, California. m14-4w

Machinery and Castings of all kinds.

OVER \$3,500 PER MONTH SAVED BY THE USE OF HENDY'S IMPROVED CONCENTRATOR.

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

JOSHUA HENDY, Esq.—Dear Sir:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feather) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years. I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—Dear Sir:—In answer to your inquiries as to your concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over \$3,500 per month more than with the blankets and huddles formerly in use.

O. C. HEWITT, Supt.

References:

References are made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Owhee District, Idaho.
LUCKY MINING CO. (3 Concentrators).....	Sonora, Mexico.
EL TASTE CO. (3 Concentrators).....	Georgetown, El Dorado Co.
ST. LAWRENCE MILL.....	Newcastle, Placer Co.
ST. PATRICK MILL.....	Newcastle, Placer Co.
JULIAN MILL.....	Amador Co.
VIRTUE MILL.....	Amador Co.
KEYSTONE MILL. (22 Concentrators).....	Amador Co.

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 19th, 1868."

CAST STEEL SHOE AND DIE COMPANY,

OFFICE—Room 28, Hayward's Building, 419 California St., S. F.

Patented CAST STEEL SHOES & DIES for Quartz Mills.

Price, 20 cents per Pound.

An improvement greatly needed—being Stronger, more Durable and Economical than Cast Iron; as the Dies, when worn down, can be welded to the Shoes as easily as bar steel; never break, keep their full striking surface. Battery of five shoes crushes one-ton more ore in 24 hours than Cast Iron Shoes, will wear as long as four set of Cast Iron Shoes, and can be worn down to 1/2 inch in thickness. The studs can be welded into Picks, Hammers, etc.

—ALSO—
Cast-Steel Tappets, Cams, Hammers,
Gearing and Castings

OF ALL KINDS, A SPECIALTY.

It takes forty days to fill orders.

CAST STEEL DIE.

CAST STEEL SHOE.

ALL KINDS OF Brass, Composition, Zinc, and Babbit Meta Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Belles and Gongs of superlotion. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIAN.

For further particular supply to

IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for completion of assays in Grains Grammes, will be sent free upon application.
7v25-1f JOHN TAYLOR & CO.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.
Silver-Plated Copper Amalgamating Plates,
for Saving Gold.
Of all sizes and in any quantity, furnished to order. Full instructions sent for operating.
Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.

Quartz Crushing & Ore Sampling
MILLS.
Nos. 413 & 415 Mission st., bet. First & Fremont, S. F.

Ours is the OLDEST, LARGEST and MOST EXTENSIVELY KNOWN establishment of this kind on the Coast.
Our mills are under the direct supervision of one of the most experienced Samplers and Millmen in the country, and we purpose carrying on the business upon a scale commensurate with the wants of the mining public.
We have the best facilities for Crushing, Sampling and Pulverizing all classes of Gold, Silver, Copper and Lead Ores and other minerals.
We also crush and pulverize all kinds of Marble, Fire-Clay, Bricks, Coke, Cement, etc., upon the shortest notice, for which we have special mills.
Reliable information furnished to miners and ore dealers concerning shipments, freights, prices, etc.
Prompt execution of all orders. Faithful attention to business entrusted to us.
Abundant storage room without extra charge.
ja31-1f "JIM" WHITLATCH, Sup't.

AUBURN MILL COMPANY,
Reno, Nevada.
Purchase Silver Ore in quantities of ten tons and upward, delivered on board the cars at San Francisco or Oakland at the annexed Net Rates, WITH NO CHARGE FOR SAMPLING OR REDUCTION. On lots of less than 10 tons, freight to Reno will be deducted.
Special Rates for Gold Ores.
On Gold contained in Silver Ore to the amount of \$30 and upward, 63 per cent. will be paid. When less than \$30, and above \$10, the amount will be added to the Silver value. Sacks promptly returned free of charge. Ores sampled by Battery or Sampling Mill as shipped may elect, and returns made promptly by cheque on San Francisco.
Rates:

Silver		Gold		Silver		Gold		Silver		Gold

VOLUME XXVIII
Number 13.

An Iron Fastened Wood Pavement.

The people of San Francisco have probably been as much exercised on the subject of street pavements as have the people of older and larger cities; and, moreover, they have come no nearer a solution of the question as to which style of pavement is best. It is claimed for one kind, that it is the most durable; another, that it is the cheapest; another, that it is easier on the horses; and, in fact, all kinds have something to recommend them. We have not space to spare to describe the different varieties of pavement now in use in this city; and, if we did, we should have a score of contractors on our heels, each denying the claims of the others, and extolling his own special pavement. There is no subject, perhaps, which excites taxpayers more than this question of pavements; unless, perhaps, it is what the legislature is going to do next. Our intention was, on commencing this article, to describe a new style of wooden pavement just being introduced before the public.

The pavement in question, is the invention of Edwin W. Perrin, formerly of Portland, Oregon, who claims to be able to do away with the main objections to the wooden pavements already in use. These objections are that in a short space of time, under the influence of our long wet winters and long dry summers, the ordinary wooden pavements "bulge up" in spots and ruin the roadway. This peculiarity may be fortunate for the poor families who carry off the blocks, but is unfortunate for the tax-payers who foot the bills. Mr. Perrin thinks he has overcome this difficulty in a very simple manner, and will shortly have some of his pavement down, and give it a practical trial. This general plan is to set a series of wooden blocks on the road-bed and connect them by a system of rows which will prevent them settling, thus keeping the surface in its original shape.

The engraving on this page will give a good idea of the general plan of Mr. Perrin's pavement, and will also explain its construction. The blocks are made about 16 inches square, and of a depth suitable for strength. The upper surfaces of the blocks are channeled, or grooved, when the block is made, and these grooves serve to hold sand, gravel, asphaltum, or other suitable substance, to give a foothold for animals. Below the bottom of the channels, the blocks are pierced with holes horizontally, and at right angles with each other, and through these holes rods are passed, so as to unite the blocks in every direction. These rods are merely stout iron pins, joining each block to another on all four sides. There being no small pieces of board between the blocks to sink down, this pavement is not liable to bulge up. The asphaltum, or other substance, is so thoroughly boxed in, there is no chance for it to be driven down in summer, when the blocks contract, as in some of the wooden pavements in use. When this is the case, and the blocks swell in winter, the pavement bulges up. In the construction of this pavement, the inventor claims to obviate this difficulty, as the asphaltum can go no further than the bottom of the grooves in the blocks.

By this construction the inventor is able to form his pavement with any ordinary solid foundation of earth or sand, and, from the size of the blocks and method of uniting them, he claims that they are prevented from turning up or becoming irregular upon the surface from the unequal settling of the bottom. When it becomes necessary to take up any part of the pavement to put in a sewer or gaspipe, it can be done by pushing back the short rods and relieving each separate block, when it can easily be raised. A peculiar instrument is used for this purpose. This is done by removing a portion of the asphaltum or gravel down through the side groove, and inserting a chisel, by which means the rod may be pushed back sufficiently to relieve the block. These rods are only six inches long and may be pushed back easily into the hole when it is necessary to replace the blocks. The principal point claimed, by the invention is, that by means of the iron rods the blocks are all joined together in such a manner that they will not bulge or

become depressed, but will remain solid and secure. The channels in the blocks are cut by machinery, and the holes are bored by the same agency. Sidewalks may be made in the same manner, the blocks being smaller and no nails being used. The feature of the block is, that no solid bed has to be made, as in one block there are four, or a number of ordinary blocks, turned on edge, and the lower part being in one piece, makes a bed for itself. The rods join the different blocks together in such a manner as to keep them in their places. Parties desirous of further information can address the inventor at No. 729 California street, in this city.

Mine Ventilating Machine.

A correspondent, speaking of our illustration of Williams' mine ventilating machine, which

PERRIN'S IRON-FASTENED WOOD PAVEMENT.

appeared in the Press of March 14th, says that a single acting machine of the same character has been in use in the vicinity of West Point, Calaveras county, for some years. He says:

In an upright box, say four feet square, an inner watertight compartment is made, about three feet in height, leaving a space of six inches between it and the outer box, which is filled with water to the depth of about two feet. A hole, say four inches square, is cut in the center of the bottom of the innermost compartment from whence the air is taken to the mine. An inverted box, having one or more valves in its top, is placed over the inner box and constitutes the piston. The valves are open when the piston is at rest or going up, but shut on the down stroke, when the air is forced into the mine.

This is the most simple form, although its construction admits of variety. The power required to work this cheapest and withal very powerful machine is nearly nominal. We mentioned in the article in question that Mr. Williams was also the original inventor of the single acting machine and had used it for years in mining in England. The double acting arrangement, however, doubles the capacity of the machine, while the power required to run it is very little more than when single acting. The apparatus is, as our correspondent says, very easily run, and is so simple in construction that any carpenter can make it.

PROTECTION TO MINERS.—The Assembly Bill for the protection of coal miners has passed the Senate. It requires all miners to keep in good order and operation two shafts of ingress and egress; means of ventilation sufficient to give each miner 230 feet of pure air each minute; keeping hoisting machinery in good order; and overseers of mines to be deemed guilty of manslaughter if death occur from want of attention to its provisions.

The Approaching International Exposition of Chile.

Some of our local contemporaries have given this proposed exposition a passing notice, but it is evident that the importance of the matter has not been duly considered. Fairs or exhibitions, general and local, are among the most powerful means employed by modern civilization, for the purpose of bringing the people of various countries together, and of promoting their advancement by the means of the interchange of ideas and of products, thus secured. The republic, (Chile) which does not omit any measure to strengthen its ties with the States of this continent, is now preparing one of those grand, civilizing fairs, and calls the attention

neighbors to go beyond their absolute wants in making their purchases. Especially is this a mistake when applied to Chile. Her imports of articles of luxury, compared with those of necessity, are remarkably large. Jewelry, costly furniture, gold and silver-ware, wines and tobacco, are among the articles which the people buy largely, and pay for liberally.

The American exports to Chile of the more substantial articles of trade, during the fiscal year ending June 30, 1873, range as follows: agricultural implements, \$75,713; barley, \$12,178; coal, \$5,100; railroad cars, \$31,106; cotton, raw and manufactured, \$249,053; iron, and manufactures of, \$401,763; refined illuminating oils, \$126,933; lubricating oils, \$6,970; lar-l, \$43,608; sewing machines, \$43,321; spirits of turpentine, \$10,295; sugar and molasses, \$290,575; tobacco and manufactures of, \$36,000; wood, and manufactures of, \$212,262; household furniture, \$150,638. The exports of Chile are also worthy our commercial consideration. Her production of copper alone is equal to two-thirds of all the rest of the world.

This is the second International Exposition of Chile, the first occurring in 1869. It is by the decree, and under the protection of the government. The approaching exposition is to be opened at Santiago, September 16, 1875. The rules that have governed International Expositions throughout the world have been adopted, and have been published in a neat pamphlet, which contains a full programme, list of officers, and explanations of the objects and general management of the exposition.

Those of our readers who are more particularly interested in this matter will receive the requisite information by calling on Francisco Casanueva, Consul-General of Chile, at his office, 506 Battery street, Room 27, San Francisco. This officer deserves the highest commendation, both from the government which he represents, and from our own citizens, for the zeal which he has manifested in this matter, as well as for the thorough and agreeable manner in which he has fulfilled the duties of his office during the two years of his official residence here. And we can insure the prospective exhibitors of American products at the coming exposition, that they will meet with a pleasant reception, and receive the hearty co-operation of this efficient and gentlemanly official.

Copper.

James Lewis & Sons' monthly report on ores and metals in Liverpool, states that the value of copper declined during the month of February to the extent of £4 10s. per ton, and this in the face of moderate charters, considerable exports and no material increase in the stocks of Chile, money being cheap and plentiful. The principal cause assigned for this depreciation was the forced sale of several large parcels of bars held by some of the sufferers from the late London failures; but it would appear more likely that copper is affected by the usual depression that pervades trade there generally, and the fall in value of almost all articles of produce, and of metals more especially. The sales of bars amount to about 3,500 tons, at £83 down to £76 10s., according to brand. The market closed 10s. to 20s. per ton better than the lowest point. The sales of furnace material in February composed 554 tons of ore at Swansea on the fourth, at 15s. 6d.; 200 tons regulus to arrive at Swansea, at 16s., on the eleventh; 450 tons regulus in Liverpool at 15s. 9d., on the seventeenth; 300 tons regulus at Liverpool and 800 tons in Swansea at 15s. 6d., on the nineteenth. The average of the Swansea tick-ling of the tenth, was 14s. 9½d. for 17½ per cent. produce. The Cape ore realizing 15s. 7½d. per unit.

Latest quotations in Liverpool were:—ore, 14s. 9d. to 15s.; regulus, 15s. to 15s. 3d. per unit; bars, good ordinary brand, £77 to £77 10s.; special brands, £80 to £81 per ton. Chile exports to the first of February amounted to 4,444 tons, loading on the first of January, and 1,689 tons, chartered to the first of February. Stocks of west coast produce are estimated, by Messrs. Lewis & Son, at 20,370 tons fine, against 20,063 tons on the first of February.

A chromic iron mine near Cloverdale is turning out 20 tons of ore per day.

of the world, and especially America, to the fact.

The coming exposition affords an opportunity by which America's business enterprise can secure both honor and profit. The efforts of those who have looked after the interests of our foreign trade, have hitherto been too exclusively devoted to securing a few "big customers," for a limited number of our products, to the neglect of numerous moderate buyers, by whom we could secure a more diversified trade.

Probably no country in the world is in closer sympathy with ours, by the form and character of its government, than the Republic of Chile. Added to this, which is a decided advantage to start with, the people of Chile are particularly well disposed toward Americans; and we speak advisedly when we declare that if the trade representatives of all the nations of the earth were to offer their respective products in the markets of Chile, the merits and prices of the articles being equal, those of the Americans would meet with a decided preference. Yet our government, by being too much absorbed in its dealings with the "great powers," and our commercial representatives, by failing to realize even the present importance of the trade with Chile, have derived but little profit from these advantages.

Californians especially are too much inclined to slight all commerce which is not in direct communication with the port of San Francisco; but, if they will take, for instance, Chile's import of American wines, which is already considerable, and is steadily increasing, they will be able to realize that the wine-producers of California may receive substantial benefits from its trade with Chile, even though the wine be sent thither from Eastern ports. We are assured that there is here an opening market for California wines which we should be careful about slighting.

There is evidently a popular mistake in regard to the ability of our South American

CORRESPONDENCE.

Knox & Osborne vs. Phoenix Mining Company.

EDITORS PRESS:—I notice a paragraph in your last issue (March 21) referring to a suit recently decided in Napa, entitled "Knox & Osborne vs. Phoenix Mining Company," in which the published statement (not original with you) does not in any particular represent the facts. The suit was commenced for an amount less than \$3,000, and afterwards, by agreement, submitted to arbitration. The result was an award to plaintiffs of \$5,000.

It was attempted to be proved by the P. M. Co., that the furnace (the pay for building which was in controversy) was badly constructed, and that the company lost large amounts of quicksilver, and hence resisted payment for balance due. In trying the case, the following evidence was put in, showing the quantity of the ore, and results of the furnace working.

An assay was offered by plaintiffs, made by Rietoe & Luckhardt, in May, from a sample taken from about 60 car loads, about May 4th to 7th; of what is called coarse ore; also from a portion of about 20 skodes, taken from different parts of the pile by myself, and as fairly selected as a sample could be. R. and L. testified to the correctness of the assay, and certified the result viz:

Coarse ore, 46-100 of 1 per cent.; fine ore, 1.53 of 1 per cent.; fine ore, 1.55 of 1 per cent.; average 1.54. The superintendent for defence testified the following yield from the furnace in January and February: 600 tons coarse ore; 58 flasks cleaned up. Percentage, 3697 $\frac{1}{2}$ -10,000, or, in round numbers, 37-100 of 1 per cent. April, 297 tons run, 32 flasks put up; 412-1,000 of 1 per cent. May, 281 tons run, 70 flasks put up; 953-1,000 of 1 per cent. The 281 tons in May, was one-half from the coarse ore and one-half from the adobes, making an average by assay of 1 per cent.

The foreman in the mine, and others testified that the ore on the dump, and that taken from the mine from the first of January to the first of July, was of the same grade, or richness. The assay in May shows what the ore contained. The result shows that in January and February, while the new condenser of sixteen chambers was being tested, the yield was 37-100 of one per cent. assay, 46-100, or a loss of 9-100 of one per cent. In April, it shows 412-1,000 of one per cent., or less than 5-100 loss from assay. In May the result is 953-1,000 of one per cent., assay one per cent.—loss less than 5-100 of one per cent. Now, Mr. Editor, if this result is had in a badly constructed furnace, what may those expect, who have good structures of our patent? For a badly constructed furnace, (as this one is claimed to be), I am satisfied with the result, till something better is found. It is true that there will be a little more waste, and loss in drying out a new furnace and getting it up to the standard working heat, which will occupy from forty to fifty days, than ever afterward, but the 9-100 loss in January and February, over and above 5-100 of one per cent., was in costing the condensers. What one other furnace has done, is shown by a communication in your valuable sheet, of October 4th, 1873, from Hubert Bankert, Mining Engineer, and Superintendent of the Napa Quicksilver Mining Company. He says: "In our works, out of sixteen hundred tons, worked in this way," (through their furnace), "only an average of eight and one-half pounds per ton was obtained, where the ore treated contained by repeated assays from twenty to eighty pounds per ton." Now, I will take the twenty pounds per ton, or one per cent. as the fair assay of the ore treated, the yield was eight and one-half pounds, or 42-100 of one per cent., while the loss from assay is 58-100 of one per cent., or nearly three-fifths of the whole. I might refer any who are curious to know what other processes lose in the reduction of cinnabar, to an article on "quicksilver extraction," in your paper, August 23d, 1873, without copying it here. Wishing all parties erecting reduction works, may have the good luck to get a furnace that will make returns only 5-100 of one per cent., short of the assay, and they will prosper. R. T. Knox.

COLORADO MINING INTEREST.—It is a matter of congratulation that our mines, throughout the winter season have been steadily and profitably worked, showing far better results than in any like season before. The shipments from the Stewart reduction works, at Georgetown, for February, were forty-seven bars, containing 49,396 ounces—\$52,154.57 coin value. The currency value of the shipments of gold and silver bullion from Gilpin county was \$180,652. The currency value of the stamp-mill gold was \$93,852. The total amount is in advance over the shipments of January of \$13,876. The advance in the amount of mill gold over January is \$28,837. The receipts of the Denver mint for January were \$25,923.99 in excess of the same month last year; and February shows about fifty per cent. increase.—*Denver Tribune.*

The Kelsey mill, Silver City, has started up on ore from the Consolidated Virginia mine. As soon as the roads will permit of hauling in that direction, the Occidental mill will be started up on ore from the same mine.

Smelting in North Star District.

A correspondent of the Salt Lake Tribune writing from North Star, Beaver county, Utah, says: In relation to the present outlook in Star, doctors are somewhat disagreed, but the writer, with many others, think it the brightest day the district has ever seen. The spring will open with two smelters, and a ten-stamp mill in successful operation. True, money just now is scarce, but we are not alone in this difficulty. Our neighbors are as bad off as ourselves, and throughout the country there appears to be a lack of currency. The financial panic has affected the mining portions of this country as much perhaps as any other. This is owing to the fact that a large amount of ready money is always necessary to carry on mining successfully, and in new districts it has to come from abroad. Such is the case in Star. It is only within the last few months that money could be realized from the sale of ores. A considerable amount has been sold to companies operating here on a credit, which has not only introduced all the inconveniences arising from doing business on "tick," but payments having been delayed in some cases, has given rise to distrust, and furnished employment for that chronic member of society, the grumbler. It is to be hoped that this very objectionable method of doing business is drawing to an end. The interest of companies, as well as individuals, is promoted by making immediate payment for whatever they purchase. Every article can be purchased from five to ten per cent. cheaper, to say nothing of the life and activity which the pay-down principle infuses.

Labor and Character of Ore.

More work has been done on the mines during the winter, now drawing to a close, than at any previous period of time, and with a few exceptions, the developments are encouraging. One thing is being demonstrated daily, if indeed it is not already an established fact, that Star is a base metal region, requiring furnaces to work its ore. Lead predominates everywhere, and its value is quite equal to that of silver. To throw away the lead, would, in a majority of cases, prove a prodigal waste, and leave a slight margin for profit above costs of mining and milling. This view of the case, no experienced miner will gainsay. There are considerable milling ores in the district, though as far as yet ascertained, they are of rather low grade.

How the Mill may Succeed.

The facilities for reducing by the mill process are so good, that with careful management, such ores can be worked with a profit. And I am confident that the mill at this place, though it has not met with the success that was anticipated, will yet pay a handsome dividend to its owners. Let the company pay down for their ores, and meet the running expenses of the mill as they mature, and they can not fail to reap a profit. Miners will sell their ores ten per cent. cheaper for cash in hand, than on even a month's credit. Laborers will work ten per cent. cheaper when they get their pay as they go along. The company being a wealthy one, there is nothing to hinder them from adopting the pay-down system, and it will certainly put wind in their sails if it does not prove the means of saving the ship.

To Attach a Smelter.

I understand that it is the purpose of the company to erect a smelter in connection with their mill. This is a wise policy, as their ample steam power will furnish any required blast, and the site is convenient to a large number of mines that produce lead ores. So far, the mill has been kept in constant operation, and the prospect is that there are sufficient ores in reach to keep it pounding away through the year '74, at least.

Thus, with the bow doubly strung, our Canadian friends ought to make money, and find their Utah property a paying investment. Such, I am warranted in saying, is the general hope of the miners at Star; for the company is a most honorable one, and withal, the pioneer of quartz milling in Southern Utah.

More Money for the Enterprise.

Dr. McHattie, one of the principal owners, heretofore the company's agent, is expected within the next week from Canada. He comes with money; and lively operations are anticipated. The doctor has many friends in Star who are looking forward to his return with considerable pleasure.

The Furnaces.

The furnace at Shaunty springs has been running the greater portion of the time during the winter, turning out several hundred tons of bullion, the precise amount I do not know. The ores used have been from a great number of mines, so that the value and character of the mineral of the district has been pretty extensively tested. These ores readily flux by mixing, though it has been found necessary to roast some of them to destroy the sulphur and arsenic which existed in sufficient quantity to choke the furnaces. I am informed that the bullion carries 90 ounces of silver to the ton. This is worth \$1.25 per ounce in New York. The lead is worth \$4.5 cts. per lb., which brings the value of the bullion up to \$228 per ton in New York, in gold. The outlay I cannot definitely state. The charcoal costs, at the furnace, 25 cts. per bushel. The hauling of the ore from the mines is done by the Mormon citizens at a very low figure. The freight on the bullion to the terminus of the Utah Southern has been about \$23 per ton.

The Wah-wah Furnace.

This furnace, which is situated at Wah-wah Springs, has been running the most of the time for about six weeks, and has turned out 200 tons of bullion, all of which has been shipped to the railroad at a cost of \$25 per ton. This bullion is the product, exclusively of ore, from the Mountain Queen mine, situated in Piute District. The value of the bullion in silver is not known here, but I think that it is not greater than that produced by the Shaunty Smelter, if indeed it be equal to it.

What has Been Accomplished.

In relation to this works at Wah-wah, it is but just to the company to state, that they have been constructed, and so far, operated under the most unfavorable circumstances. The first blow was struck in the middle of the winter, (the most severe for a dozen past), since which time has been erected and operated the most successful furnace ever built in Utah. Its capacity is four tons of bullion in five hours, or fourteen tons in 24 hours. The character of the ore has had much to do, no doubt, with the quantity of bullion produced. The former, from the Mountain Queen mine, and charcoal from piñon pine were thrown into the furnace together, and lo! the bullion by the hundred tone. The company has now commenced to mine ores from the San Francisco district, which will, no doubt, increase the value of their bullion, so this district produces some very fine mineral.

The Mountain Queen Mine.

This mine has generally been considered one of the big things of the country, though it has not yet been thoroughly prospected, a depth of seventy feet only having been reached. The yield has been immense, and the ore is said to still show in great quantity. It is mostly a carbonate and decomposed-like soil.

A Field for Operations.

There is abundant room for other furnaces in Beaver county. Beaver lake, San Francisco and Lincoln districts need one or more furnaces each. I am convinced that smelting can be made to pay with present facilities, by shipping the bullion, as Shumer & Co. are doing, direct to New York. A better way, where the company is able to meet running expenses, would be to pile up the bullion at the furnaces and await the approach of the railroad, which can not long be delayed. It is destined to make another stride at least, the coming summer.

The cost of freight from Star to Provo, the railroad terminus, would, were railway transportation complete, pay the tariff to Omaha. The amount which would thus be saved, being \$14 to the ton, would of itself afford a handsome profit. But, as there is already a gain, it would amount to more, perhaps \$20 per ton. This, so any one can see, would be a paying business.

Idaho Mining Notes.

The Owyhee *Avalanche* contains the following mining notes:

Superintendent Boyle is rapidly getting the Silver Cord in shape for extensive working. The main shaft is now down 74 feet below the second level. The first level is in 75 feet north, and the second in 100 feet north. The ledge in some places shows a width of four feet, and is very rich in gold. Mr. Boyle says that by the first of June he can give 75 men employment in taking out ore. The Silver Cord is a very easy mine to work; and, judging from present appearances, will turn out plenty of bullion next summer.

They cleaned up the last run of Belle Peck ore this week, and it panned out handsomely. The crushing of 28 $\frac{3}{4}$ tons at Trask's arrastra yielded \$5,948.44, or at the rate of \$206.55 per ton. The bullion assayed about \$11.50 in gold per ounce. The Belle Peck will make things lively in Webster Gulch next summer.

The South Chariot Company have purchased from H. S. Cheasbro the engine and boiler which belonged in the Morning Star mill, and will put it on their mine as soon as some additional machinery can be had from San Francisco. The mine is proving richer and richer all the time, and we should not be surprised to see the stock go up to \$100 per share next summer.

Mr. Cheasbro has purchased the hoisting works at present used on the South Chariot, and will put them on the Illinois Central as soon as the new hoisting works of the former are ready to run. The Illinois Central is yielding richer ore and more of it than ever.

They have finished crushing the Rising Star ore at Flint district, and will have about two tons of crude bullion over here in a few days. The mill handle all came over to Silver on snowshoes day before yesterday.

Judging from the amount of rich ore now in sight in the various mines of this camp, it is estimated that at least twice as much bullion will be shipped next summer than during any previous season.

Two miners at Hit or Miss Gully, Vaughan, Australia, a gully noted for nuggets, by the cradle obtained over fifty ounces from the bank of the gully, in four feet sinking. The gold was of a very nuggety description, there being pieces of 12 oz., 11 oz., 3 $\frac{1}{2}$ oz., 3 $\frac{1}{2}$ oz., and 3 $\frac{1}{2}$ oz., whilst scarcely any gold was less in weight than 2 dwts. It is somewhat remarkable that the party have been washing day after day since without obtaining the color of gold.

Reduction Works of Pelican Mine.

The Colorado Miner gives the following account of the reduction works of the Pelican Silver Milling Company: Some time since, brief mention was made of the fact that the Huepeden mill, which had been lying idle so long, had been secured for a new career of usefulness, and that Dr. Munson was engaged in putting it in good repair for active work.

We are glad to say that now the old property at the head of Alpine street, no longer represents inactive capital, for it has been put in thorough order and is doing good and faithful work under the control of parties who will not be likely to suffer its machinery to rust for want of use. As its new name imports, it is employed in producing silver from the ores of the Pelican mine.

In company with the Manager, Dr. G. C. Munson, we have made a thorough inspection of the mill and its workings, and take pleasure in announcing that Georgetown has another silver reducing establishment in successful operation. At present the machinery is driven by steam, but there is a large water wheel connected with the works which will furnish all the power required during the summer and fall.

The ore is delivered at the south end of the mill, and is transferred to ovens where it is heated until all the moisture is driven off. It is then pulverized in a Dodge crusher, and conveyed by an elevator into a ball pulverizer—a revolving cylinder in which loose balls of cast iron complete the work of powdering it—thence another elevator carries it up to the screens, where it is brought to a uniform size, the particles that are not fine enough to pass through being returned to the pulverizer for further treatment, while the remainder is conveyed into two large iron roasting cylinders, of the Brunswick patent, which are caused by the proper gearing to revolve on friction rollers. In front of each cylinder is a furnace, the heat from which pours continuously through the cylinder, and a peculiar arrangement on the inside causes the powdered ore to be gradually worked from end to end, while the revolving motion by subjecting every atom to the uniform action of intense heat, secures the thorough desulphurizing of the mass. Salt is added in proper proportion to secure the thorough chloridizing of the powdered ore. A "charge" for each cylinder varies, according to the quality of the ore, from three and one-half to eight tons. When the proper tests show the "charge" to be "cooked," it is discharged into a car, which runs upon a railway below the cylinders, and is conveyed to a brick cooling floor. When it is cool it is passed through another screen, and the lumps that will not pass through are mixed with the ore and again go through the fiery ordeal. The fine stuff is transferred to a couple of revolving barrels, mixed with water and escape of iron which facilitate the precipitation of the base metals; and after revolving for several hours, the mass becomes of a pulpy consistence, when quicksilver is added and again the barrels are permitted to revolve until the quicksilver has taken up every particle of metallic silver precipitated by the action of the iron from the state of chlorides in the mass of three thousand pounds—this being the capacity of each amalgamator. When the amalgamation is complete, the quicksilver is drawn off, and the "tailings" are discharged into a tank. Careful assays of these tailings are made, and if it be found that enough silver remains to justify further treatment, they are saved, but if otherwise, they are disposed of by being shoveled into the stream which dashes along outside the works. The quicksilver drawn from the barrels is then strained, and that portion with which silver is combined—the amalgam—is conveyed to the assay office to be re-treated.

The department through which the reader has followed us is under the immediate supervision of Mr. Charles E. Sherman, a gentleman who has had extensive experience in the business, and is thoroughly competent to discharge the responsible duties of his position.

The tubular boiler which furnishes the power generates steam sufficient for a 45-horse power engine, which is in fine order, and works so smoothly that neither noise nor vibration is perceptible. Mr. C. P. Storm, the master mechanic of this establishment has charge of this department. So carefully has everything been arranged for the economy of heat and fuel, that one and a half cords of wood only are consumed in twenty-four hours in the boiler furnace and for warming the building. About the same amount is required to dry the ore and run the cylinder furnaces.

The assay department, which is in the rear of the office, is in charge of Mr. Ben. F. Napeyes, a good metallurgist, who thoroughly understands his business. His position is no sinecure, for assays are to be made at every step in the progress of the work, from the raw ore to the tailings.

Mr. E. Y. Naylor, one of the owners of the Pelican mine, has his headquarters in the office. He showed us the result of several "retorts," masses of beautiful metal which retained its whiteness and lustre, showing the fineness of the mass.

We hope soon to add to our reports of "bullion shipments," a weekly statement of bars from the Pelican Silver Milling Company.

CARSON RIVER is yielding a bountiful supply of water for milling purposes.

A COMPANY has been organized in Marysville for the purpose of engaging in hydraulic mining, in Baker county Oregon.

SCIENTIFIC PROGRESS.

Molecules.

Professor Clark Maxwell lately delivered an interesting lecture before the British Association, upon molecules, by which is meant the subdivision of matter into the greatest possible number of portions, similar to each other. Thus, if a number of molecules of water are combined, they form a mass of water. Molecules of some compound substances may be subdivided into their component substances. Thus, the molecule of water separates into two molecules of hydrogen and one of oxygen.

The ancient atomic theory, described more than two thousand years ago by Lucretius, was that the molecules of all bodies are in motion even when the body appears to be at rest, and this is the accepted theory of to-day. In the case of solids, these motions are combined within such narrow limits that we cannot, even with the microscope, detect any alteration in their positions. But liquids and gases may be subjected to experiments which afford convincing proofs of molecular motion. If the gases of ammonia and hydrochloric acid, for example, be placed in a glass tube, with a stratum of air between, the lighter gas, ammonia, above, the gases diffuse through the air and produce a white cloud when they meet. Air confined in a vessel presses, as we say, against the wall thereof. What we term pressure is simply the impact of the moving molecules against the interior surfaces of the vessel. The amount of the pressure depends upon the number of molecules of air or gas within the vessel. By the application of heat, the movement of the molecules is increased in velocity, and such increase, of course, causes each molecule to strike harder against the walls of the vessel; in other words, the pressure is increased; the law of such increase of pressure being as the square of the velocity of the molecules.

Dr. Joule has calculated the velocity of hydrogen molecules, at the temperature of melting ice, at a little over 6,000 feet per second. The molecules of ammonia move about 2,000 feet per second. The molecules of common air move with a velocity of seventeen miles per minute; and, if they all moved in the same direction, nothing could stand such a wind. But molecules constantly impinge against each other; and, by this contact, their directions of motion are incessantly changed.

Professor Maxwell has calculated the size, and weight of hydrogen molecules, and finds that about two millions of them, placed side by side in a row, would occupy a length of about one twenty-fifth of an inch; and that a package of them, containing a million, million, million, million of them, would weigh 62 grains, or not quite one-eighth of an ounce.

Each molecule throughout the universe, says our author, bears impressed on it the stamp of a metric system as distinctly as does the meter of the archives at Paris, or the double royal cubit of the Temple of Karnac.

No theory of evolution can be formed to account for the similarity of molecules, for evolution necessarily implies continuous change, and the molecule is incapable of growth or decay of generation or destruction. None of the processes of nature, since the time when nature began, have produced the slightest difference in the properties of any molecule. We are therefore unable to ascribe either the existence of the molecules or the identity of their properties to the operation of any of the causes which we call natural. On the other hand, the exact equality of each molecule to all others of the same kind, gives it, as Sir John Herschel has well said, the essential character of a manufactured article, and precludes the idea of its being eternal and self-existent.

Thus, we have been led along a strictly scientific path, very near to the point at which science must stop. Not that science is debarred from studying the internal mechanism of a molecule which she cannot take to pieces any more than from investigating an organism which she cannot put together. But in tracing back the history of matter, science is arrested when she assures herself, on the one hand, that the molecule has been made, and on the other, that it has not been made by any of the processes we call natural.

Science is incompetent to reason upon the creation of matter itself out of nothing. We have reached the utmost limit of our thinking faculties when we have admitted that; because matter cannot be eternal and self-existent, it must have been created. It is only when we contemplate, not matter in itself, but the form in which it actually exists, that our mind finds something on which it can lay hold. That matter, as such, should have certain fundamental properties, that it should exist in space and be capable of motion, that its motion should be persistent, and so on, are truths which may, for anything we know, be of the kind which metaphysicians call necessary. We may use our knowledge of such truths for purposes of deduction, but we have no data for speculating as to their origin. But that there should be exactly so much matter and no more in every molecule of hydrogen is a fact of a very different order. We have here a particular distribution of matter, a collocation, to use the expression of Dr. Chalmers, of things which we have no difficulty in imagining to have been arranged otherwise. The form and dimensions of the orbits of the planets, for instance, are not determined by any law of na-

ture, but depend upon a particular collocation of matter. The same is the case with respect to the size of the earth, from which the standard of what is called the metrical system has been derived. But these astronomical and terrestrial magnitudes are far inferior in scientific importance to that most fundamental of all standards which forms the base of the molecular system. Natural causes, as we know, are at work which tend to modify, if they do not at length destroy, all the arrangements and dimensions of the earth and the whole solar system. But though, in the course of ages, catastrophes have occurred, and may yet occur in the heavens, though ancient systems may be dissolved and new systems evolved out of their ruins, the molecules out of which these systems are built—the foundation stones of the material universe—remain unbroken and un worn. They continue this day as they were created, perfect in number, and measure and weight.—*Scientific American*

Application of Solar Heat as a Motor.

G. A. Bergh argues in a German scientific paper, the practicability of applying the sun's heat to drive engines; a plan which has been long advocated, but which seems as far from being put into practice as ever. He says: That the heat of the sun may be transformed into mechanical force no one can doubt; for we see daily what masses of water, solar heat raises into the air, to be precipitated to the earth; and we know what an enormous mechanical force is here represented.

But while solar heat is the cause of nearly all mechanical force developed on the earth, we have yet hitherto known of no means whereby it may be directly utilized for mechanical work. It has been proposed, indeed, to employ solar heat, concentrated by lenses or mirrors, for driving a steam or caloric machine. These machines, however, are not suited for this, as they involve too great a waste of heat. Moreover, in concentration, a large quantity of heat must be lost.

Machines which serve for the transformation of heat into mechanical work, rest on the principle that a liquid or gaseous substance, acted on by the heat, undergoes a molecular change, through which a certain mechanical force is developed. The changes of solid bodies, under influence of heat, are too small for transformation of the heat into mechanical work, or to render them means of movement; although, through such molecular change, a certain mechanical force is developed. Gaseous bodies have been applied as a means of movement in the caloric and gas machines; but, with the small differences of temperature which occur in some machines, they cannot be employed as such, with advantage. Thus nothing remains but to employ a liquid; and it must be one whose boiling point is very low. There are several such liquids, sulphurous acid, methylic chloride, methylic ether, etc. Of all these, sulphurous acid best deserves attention, as it has several useful properties for the end in view. It is not difficult to condense. The keeping of it presents no difficulties, and it may quite well be put in ordinary steam boilers.

Take a vessel, A, filled with sulphurous acid, exposed to the sun's rays: the tension of the sulphurous acid vapor, if the temperature of this vessel exceeds that of the surrounding air by 10 or 20 degrees, must be from one to three atmospheres higher than that of the sulphurous acid vapor in another vessel B, similarly filled with sulphurous acid, but which has only the temperature of the surrounding air. We can thus arrange an engine, which agrees in principle with the steam engine, with merely this difference: that the water is replaced by sulphurous acid, the fuel by the solar heat; while the vessel exposed to the sun's rays represents the steam boiler, the vessel kept at ordinary temperature may represent the condenser. The sulphurous acid, condensed after doing work in vessel B, could easily be driven back by a force-pump into the boiler representing vessel A. The capability of work of such a machine must naturally increase with the amount of the heat communicated to vessel A, or be proportional to the surface exposed to the solar rays.

If now, we conceive a factory or shop, the roof of which is covered with vessels containing sulphurous acid, and which is furnished with a sun machine, made on the above principle, such a machine might indeed work while there was sunshine; but, in default of this, the establishment would be brought to a standstill. True, the solar heat might be replaced by the heat of the air, if the temperature of the air were pretty high, and one had at hand a cooling substance like ice. But as this is not always the case, the establishment should have, besides the sun machine, an apparatus which might "store up" some of the work done by this. As such, Natterer's apparatus for condensing carbonic acid might with great advantage be used. If a supply of carbonic acid were kept in a large gasometer, like those in ordinary gasworks, the Natterer apparatus might be fed from this. In a wrought-iron vessel thus filled with liquid carbonic acid, we should have an enormous store of mechanical force, which might be made to replace the action of solar heat in the sun machine, partially or wholly. After work done, the carbonic acid, becoming gaseous again, might be collected in the gasometer. Or, again, the sun machine, while in action, might drive an ice machine, and might, in default of sunshine, profit by the ice it had produced, for maintenance of its working.

We thus see that, from the present standpoint of science, it is possible to construct a constantly working sun machine.

MECHANICAL PROGRESS.

Hollow Walls.

It is well known that walls of extra thickness, made of brick, are very apt to be weak and fall to decay in a comparatively short space of time. This fact may be accounted for at once, when one remembers that mortar requires the free action of the atmosphere, without which it will not harden. It is true that the brick will absorb the moisture, but the lime and sand will become disintegrated, and crumble away without effecting the purpose required, namely, that of forming a binding joint. Walls three feet thick have been taken down after twenty years' standing, and found to be little more than rubbish at the core. Such brickwork is sure to be weak; for the damp increased in it will work ruin most effectually, both inwardly and outwardly.

In the construction of fortifications, this existence of damp at the core of the wall is avoided by using water-lime cement, instead of quicklime, as the former will indurate under the very influence that proves an insuperable obstacle to the hardening of the latter. Besides, the courses of brick masonry in fortifications are raised so slowly that it gives ample time for the setting of each course before the enceding one excludes it from the action of the atmosphere.

To give an opportunity to ordinary walls of dwellings, etc., to receive the full benefit of the air on the interior, a method of hollow-wall has been introduced in building, and this is accomplished either by a novel article of brick or block, cast with an elongated aperture within itself, or it is brought about by so using ordinary bricks as to leave a hollow space varying from two to four inches in the rear of the wall.

The great difficulty to be encountered in the formation of hollow walls is found in the fact that there must be binders, or bricks laid crosswise, at every fourth or fifth course. Such bricks serve as ducts to convey moisture from outside to inside. And, as there must necessarily be a great number of these, it is very evident that the transit of damp is not wholly prevented by the system of hollow walling. It is to avoid this mischievous intervention of the binders that a patent mode of hollow-wall has been introduced in the West, by a builder of much experience, at San José, California. His plan is to substitute for brick binders, laid diagonally, reversing the slope every second course, or alternately.

These ties are simply laths such as are used in plastering. They are four feet long, and are cut three times, so as to give four ties of a foot in length to each lath. But for twelve-inch walls it is proposed to make the lath ties sixteen inches. They are scattered along every fourth or fifth course, throughout the wall; and spaced about ten inches apart on the wall.

This is certainly a very economic way of treating this matter, and the binding principle must surely be preserved by it. But in the event of fire, how inevitably would the devouring element seize upon the very vitals of its prey, and, in the destruction of these laths, most effectually disintegrate the wall.

However, the plan is nevertheless a good one, and the substitution of hoop-iron would guard against the fearful eventuality alluded to in the use of laths.

As to any sanitary benefit being derived from the use of hollow walls, their efficiency is doubtful; indeed, one may incline to the opinion that these same intervals or spaces in walls are dark chambers for the generation of poisonous gases, which are apt to find an entrance through the porous brick into the dwelling apartments and bed-chambers of houses, superinduced by the attractive atmosphere there. To be sure, this objection might be obviated by ventilating apertures. But these, again, admit the external cold, and permit the escape of the internal heat.—*American Homestead*.

PNEUMATIC CALL BELLS.—A French inventor has lately brought out a novelty in bells for houses. A series of small leaden tubes proceed from the kitchen to each room, one to the sitting-room, one to the drawing-room, and one to each bed-room. Attached to these tubes in each room are a few feet of India-rubber tubing, suited in color to the paper of the room. To the end of the tube a syringe is fixed airtight, and this hangs similar to an ordinary bell-rope. In the kitchen is a case containing the bell, which serves for all the rooms, the distinction being effected by tickets with the names of their respective rooms printed on them, held down by springs. They work in this manner: the India-rubber syringe is pressed, and the air by this means is forced through the tube into a corresponding India-rubber syringe or ball in the case in the kitchen. This, of course, expands, and forces up a small rod, which moves a cog-wheel and rings the bell, and at the same time sets free the spring which retains the ticket of the room in which the bell is rung; this starts up into a square in the glass door, and at once indicates in a simple manner the room. These ingenious bells act as effectively as electric bells, without their trouble and expense, and not getting out of order like our wire bells and cranks.—*Iron Age*.

Railway Brakes.

We take the following from an editorial in the *London Times*: The chief features of a good continuous brake are that its application is effected by one hand of the engine driver himself, and that it can be applied instantly and simultaneously to every carriage in the train. The present engine brake acts with comparative slowness, so that a certain amount of time is lost in screwing it up. It is reinforced by one or more brakes of the same construction, which are under the control of the guards. If a driver perceives that a collision is imminent, he orders his stoker to put on the engine brake, and he blows a whistle which directs the guards to put on theirs. If the guards hear and heed the signal, they have still to tighten their brake screws by several turns of their handles; and, practically, many precious moments are lost before such brake power as the train possesses is brought to bear in retarding it. Moreover, this power is only enough to arrest motion very gradually; for the new wheels which are checked or skidded will be carried along by the momentum of the train acting upon the many wheels which are still free to revolve. With a continuous brake, however, the driver who sees danger ahead can apply the blocks to every wheel, by a single movement of his hand, in less time than it would take him to give an order to his stoker, or to sound a signal for his guards.

The result is that a powerful retarding force is actually brought to bear. Before, under the old system, a single hand would be placed upon the levers by which the brakes are governed. A saving is thus effected equivalent to the time and distance which the train would have run between the driver's first perception of danger and the full operation of the brakes that were screwed down in response to his orders. A further saving is effected, dependent upon the exercise of a retarding force upon every carriage, instead of upon, say, two brake-vans only; and, on account of this part of the arrangement, it is scarcely more difficult to stop a long and heavy train than a short and light one. It is impossible to express the retarding force in very definite terms, because it will depend partly upon the state of the rails, and partly upon the momentum of the train, which, in its turn, is dependent upon the speed and upon the load conveyed by the carriages. Momentum is weight multiplied by velocity, and a train of empty carriages, drawn at 20 miles an hour, would be stopped by any brake in a shorter distance than would be required for the same train when its speed was increased to 30 miles, and its weight by the addition of a full load to every carriage. As weight and velocity are matters which vary continually, it is obviously impossible to say that any brake would stop a train in any given distance; but it would be quite correct to say that any continuous brake would stop a train of moderate speed almost instantaneously; or, at most, in its own length, unless the rails were unusually slippery. Collisions were once very frequent in America, where they are now exceedingly rare; the general adoption of the air-brake having given drivers such command over their trains that nothing but a dense fog, or a sharp curve in a deep cutting, or some other condition presenting an impenetrable obstacle to vision, could render a collision possible. When the pneumatic brakes were first used in the States, the newspaper space, which had previously been devoted to collisions, was for a time occupied by narratives of the circumstances under which collisions had been avoided. Now, however, the subject has passed beyond this stage; and it is as much a matter-of-course to pull up a train that is rushing upon danger as it would be at a crowded corner to rein horses which were well in hand.

A DESTRUCTIVE ENGINE OF WAR.—The recent trial of the Taylor battery gun, upon which the Colt company, of Hartford, has, for some months, been engaged, shows it to be the most formidable weapon of war that has yet been invented. Its barrels are twenty-four in number, and are arranged in two concentric circles. They are also regulated so as to radiate their fire, covering a horizontal line of twenty-two feet, at a distance of five hundred yards. The gun fires with great rapidity, by fusillade or by volley, at the pleasure of the operator, while the cartridges are fed into the barrel from suitable charging cases, which are introduced into the interior of the breech cylinders. The results at the late trial were astonishing. In firing a single barrel, at a distance of five hundred yards, bullets were repeatedly sent into an eight-inch hull's-eye. In firing the fusillade, the twenty-four balls were distributed on a horizontal surface, twenty-two feet long, at a distance of a foot apart, and firing by the battery, the same results were accomplished. The rapidity of the fire was remarkable, being at the rate of seven hundred shots per minute. The terrible effectiveness of this weapon in battle, and the utter powerlessness of charging columns in the face of a fire, can be seen by the fact that every second sweeps over twenty feet in length, and mows men down at the rate of a regiment a minute. The inventor of this remarkable weapon is Colonel James P. Taylor, of Knoxville, Tenn. His invention was conceived in 1870, and patented in July, 1871, and it has since been improved until its present extreme simplicity, have been reached. The manufacture of the gun is to be rapidly pushed and active measures taken for its introduction among foreign governments.—*Am. Manufacturer*.

Weekly Variations in Stocks.

(Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.)

STRANGE & Co., who, for some time past, have been engaged opening a hydraulic on the west side of Stockton ridge, commence washing to-day. There are now six large hydraulics in full blast within two miles of Mokelumne Hill.

EL DORADO COUNTY.

THE EXCELSIOR.—*Republican*, Mar. 19: We visited this claim on Tuesday, and found the men piping away in the same place where they commenced operations in the early part of the winter, with two six-inch streams. A large mass of rock and earth had to be moved at this point before they could commence operations upon the main bank. It has now been pretty well cleaned out, and a large space of bed rock is visible. In the mean time a flume has been constructed, most of the way under ground, from the north side of the claim, intersecting the present flume near its terminus, and hydraulicing will be commenced at that point in a day or two. They are now using about 900 inches of water; the flumes are four feet wide with several under currents at different points.

AMADOR QUICKSILVER MINING COMPANY.—*Sutter Creek Independent*, Mar. 18: We learn that the work on the quicksilver mine, owned by the company in El Dorado county, is progressing vigorously. The tunnel has been driven 34 feet, at which point the lead is nine inches in width and contains some very rich ore, while in the shaft which has been sunk 10 feet, the lead is eight inches wide, and contains rock much richer than derived from the tunnel. At the present time there is about 60 tons of rock awaiting retorting, and we understand that it is the intention of the company to build retorting works as soon as the condition of the roads improve.

OREGON HILL.—*Mountain Democrat*, Mar. 21: The Oregon Hill Mining Company are drifting from their 300-ft. level, and have already drifted a distance of 150 feet, 100 feet of which distance was on and through a ledge about two feet in width of splendid looking ore. At the distance of 150 feet—the present length of the drift—they have struck a large body of ore, the extent of which has not yet been determined, which from indications will yield \$20 per ton, mill process.

THE "ROSE."—The owners of this mine are still sinking in both shafts, in their claim, and are now down about 75 feet in each. The northern shaft is being sunk on the ledge, following its dips, etc. The southern shaft, which is being sunk for a working shaft, is now being run through bed rock. This shaft is a fine piece of workmanship, and is timbered with an idea to permanency and security. The company have quite a large amount of ore on the dump.

MARIPOSA COUNTY.

PROSPECTING.—*Gazette*, Mar. 21: Numerous urchins are to be seen picking and panning out hereabouts. Industrious habits are commendable, and they may as well become inured to disappointment in early life.

MOUNT OF EXT.—One day last week, George Temple, in walking over his claim, found a piece of gold worth \$3. Mitt Again, on Sunday last, picked up a bit worth \$2.75, in front of George Stewart's saloon. Keep at it, boys.

NAPA COUNTY.

PINE FLAT MINES.—*Cor. Reporter*, Mar. 21: In items of interest to Napa county, I lately noticed an article in a Sonoma paper, in reference to Pine Flat Mines, stating that they were not of as much value as they have been reported. Mr. Editor, allow me to tell your readers (and I hope all are interested) that this is a mistake; we can show as rich mines as have ever been reported, and furthermore, there are a great many claims that are of great value that do not claim Pine Flat as their father or fountain-head. I have, of late, taken quite a trip over this extensive mining region; and find many new discoveries, which seem generally to be second to none previously located. Lake county is beginning to send out her experts in different directions, with hammer in hand, testing rock on her rough hills. There are in our range but two mines reducing ore, but less than three months will tell of at least ten mines in good working order. In ten days not less than ten men will be at work on the Leet Ledge. The Kentuck will, with many others, soon be in operation.

MORE QUICKSILVER.—Last Tuesday, Steve Jones brought some cinnabar to town that was covered with globules of pure quicksilver. The rock appeared to be full of it, as the silver could be shaken out into the hand. This specimen was a piece of surface rock, taken last week from a newly discovered ledge, which lies between Foss and Capella's valleys, and can be easily traced for four miles by its croppings.

NEVADA COUNTY.

REPORTED DIAMOND FIND.—*Graes Valley Union*, Mar. 21: Some round and white stones were brought to town yesterday, and they were very hard and brilliant. Some supposed that the stones are diamonds. We did not learn the exact spot at which the find occurred, but that between this place and Rough and Ready is the favored land; the Golconda of Nevada county. Some of the stones found are to be sent to Crosby, Morse & Foss, of Boston, to be tested.

SPECIMENS FOUND.—Yesterday, a number of loads of rock from the Rocky Bar, old dump pile, were hauled to Main street. The specimen hunters were around as usual, as soon as a wagon load was dumped. We noticed that Andy Stokes picked up a ten dollar specimen from out a pile of waste rock. In that Rocky Bar waste there are many specimens. If we had nothing else to do we would break rock all

day in hopes of finding a specimen worth a day's work.

PLACER COUNTY.

HERALD, Mar. 24: Mining in the upper portions of the county has been much retarded by the continued bad weather and heavy fall of snow, which has blocked the ditches and shut off all supplies of water. All this loss of time, though, will be amply made up as soon as the snow begins to melt. We can safely calculate now that the winter is pretty much over, and with the present prospect for an abundant supply of water for several months, we will have such lively times among the hydraulic and sluice miners as have not been known for years. Plenty of water is all that is needed to insure this, and that we have in the form of snow in abundance, which will wisely be dispensed as needed.

MINING.—Work, in the early part of the week, was expended on the Orleans mine, for a few days, on account of water.

The Crater Hill mine is working about 100 men, and every day's work gives now encouragement to its owners. If this mine keeps up its lick, it will soon be entitled a place in the front rank of mines in the State.

SISKIYOU COUNTY.

FROM THE FORKS OF SALMON.—*Cor. Yreka Union*, March 21: The "Dutch boy's claim," down below "Andy's," is running full-handed. The one-third interest of Louie Hofsetter, lately deceased, is, I understand, to be sold at public sale to a few days. S. Bell has bought I. Lockwood's claims above "Andy's," and has commenced to open them. W. R. Boyd, on Fort Bar, has got his reservoir completed and everything in running order and has commenced to send off the "pay dirt." J. E. Horn, on Stony Bar, has got his "self shooter" finished and his flume in, and is about ready to commence active operations. G. McNeal has got his bed-rock flume in, and is making the gravel "git" in a lively manner. J. S. Egbert has purchased a piece of ground from G. McNeal, and is busy sluicing it off. The Shumway Brothers, up the North Fork of Buckeye Bar, have been annoyed considerably by slides in their ditch during the winter, but notwithstanding, have managed to do considerable work and are now sending off "a right smart chance" of dirt. I understand that they intend next summer to put up a "crossing" to carry the water over from their ditch into Smaspipe Bar, a part of which was formerly worked by drifting and "payed big," and they expect by working it with the improved facilities at their command to reap therefrom a golden harvest.

Bennett & Miller are preparing to put up a "crossing" on the South Fork from Missouri Bar to Stone's Bar, to bring the water of Know Nothing Creek into the South Fork ditch, and enable them to run their lumber from the saw mill to the "Forks," and also another "crossing" on the North Fork, a little above its mouth; to bring the water from their South Fork ditch onto the Forks Bar, which will be its terminus for the present. Messrs. Fairchild & Co. have commenced operations on the red point at the mouth of Know Nothing creek, having been at considerable expense in bringing the water onto it. At the Chicken Roost, on Niggerville creek, the boys, I understand, are busy ground sluicing.

FROM LOWER SONA CREEK.—There are a few miners on Soda creek and they are ground sluicing; Bradberry & Andrews picked up a ten dollar slug this week; they pick up small wages all the time. There are a few men on Hazel creek and they are also sluicing. Robert Pitt at Portuguese Flat is running his hydraulic this winter. Tom Kneel & Dow took out \$200 near Portuguese Flat this winter from a bar on the river. They were making \$10 per day when water failed on them. They must have plenty water now.

HUMBURG.—Thos. McCann informs us that Mr. Robt. Harvey, came down to his place from the Eliza mill on Humburg last Tuesday, the first time he has been able to get out for 3 weeks on account of the great depth of the snow. Mr. Harvey reports about 24 feet of snow at the mill. The miners on Humburg have not been able to do much work as yet, owing to the scarcity of water. A few more pleasant spring-like days, such as we have had during the past week, however, and the water will be "biling" down the gulches and creeks at a lively rate.

TRINITY COUNTY.

A SAMPLE LOT.—*Journal*, March 21: Pete Van Matre came into town last Thursday, bringing with him some gold dust from the claim of W. A. Campbell and Ben Reed. This mine is located on Dutch Gulch, one of the tributaries of Buckeye creek, and from what has already been done, shows itself to be one of the richest in the county. The dust brought in by Van Matre consisted of 54 ounces, all of which had been picked up in the Campbell & Reed claim within the last two weeks. Nine of the nuggets weigh twenty-nine ounces—the largest five and one half ounces, and the smallest of the nine, \$40. The remaining 25 ounces consist of smaller pieces, but no fine gold whatever, as it was all picked up on the bed-rock. No clean-up has been made in this claim, and no estimate can be made of the amount of gold in the ditches and flume. Van Matre says the boys are liable to pick up a chunk of 70 or 80 pounds any day. All the gold brought in has more or less quartz mixed with it. This seems to be a different quality of gold from that usually found here, and Mr. Griffin, banker, will send it direct to the mint in order to ascertain its full value. Whenever water is taken on Buckeye mountain and that section of country

comes to be worked as it ought to be, we will require a small branch mint of our own. There are miles upon miles of ariferous gravel there that to-day remains unprospected, and only awaits development to prove that Trinity county contains one of the richest gravel beds in the world.

OREGON GULCH MOUNTAIN.—A number of white men and 30 Chinamen commenced work for the Weaverly Ditch and Hydraulic Mining Company this week. Owing to the amount of snow on the line nothing has been done on the ditch yet. They are at present engaged in getting out timbers for a reservoir and in making preparations for a start on the ditch.

TULARE COUNTY.

GOLD MINES IN TULARE COUNTY.—*Times*, March 21: A very rich and extensive gold mine has lately been discovered in the mountains near Mineral King mines. It is said to be four miles in length; the lead being four feet wide at the surface. Mr. W. Owens, an interested party, showed us some of the quartz specimens, which were very rich with gold. The discovery is creating a great excitement.

We were informed a few days ago, by a gentleman interested in the new mines, that two new leads have recently been discovered, just below the snow line, on the mountains. Several parties from a distance are here already waiting for the snow to disappear so as to gain access to the mines.

TUOLUMNE COUNTY.

NEW ALBANY MINE.—*Union Democrat*, March 21: Within the last week a rich body of ore has been struck in the south drift of this mine. It has already developed a vein of about 20 ft. in thickness showing gold freely throughout. The vein was worked a number of years ago by Brown & Olney, and then lay idle until recently, after being purchased by some capitalists of San Francisco. The ore now coming out of the south drift is fast demonstrating that the company have a very handsome prospect, with chances entirely in favor that a valuable mine will soon be in full operation.

NEW CHUTE OF ORE.—*Independent*, March 21: The workmen on the Brown & Olney mine have struck a new chute, which shows free gold in abundance. Dr. Faxon thinks it will not go less than \$60 per ton.

VENTURA COUNTY.

OUR OIL INTERESTS.—*Signal*, March 14: We pay 75 cents per gallon for oil and hundreds of dollars each year for lubricating oil, notwithstanding we have thousands of tons of crude petroleum oozing from our hillsides up the Santa Paula and San Antonio creeks. Mr. Surdam, one of our most enterprising citizens, propose to furnish 600 barrels of crude oil per month to any company who will undertake to refine it. Why can not a company be organized here for the purpose? We have the capital—the skill can be secured.

Nevada.

WASHOE DISTRICT.—*Consolidated Virginia*, Gold Hill News, March 19: Sinking the shaft for the 1,500-ft. level is making steady progress. A west drift has been started from the 1,300-ft. station to tap and open the ore body on that level. All the ore stopes and breasts opened, from the 1,000-ft. level down to the bottom of the north winze, which is ten ft. below the 1,400-ft. level, show richer and better as prospecting and developing the mine proceeds. Daily yield 200 tons of ore, which, as soon as mills can be obtained to crush it, can be increased to almost any desirable amount.

CALEBONIA.—As soon as repairing the shaft is completed, and the 4th or 700-ft. station is put in working condition, a drift will be started to prospect the ledge on that level. The lift pumps have been taken out down to the 225-ft. station, where the drain tunnel connects with the main shaft. This is quite a saving in the power necessary to do the pumping, as all the water from the shaft is now drained through the tunnel.

CROWN POINT.—Daily yield, 525 tons of ore, from the 1,000, 1,200, 1,300, and 1,400-foot levels. All the ore breasts in the different levels are looking well. The north winze from the 1,400-ft. level, which is being sunk on a slope, is in rich ore. The middle winze, on the same level, is also in rich ore. The water on the 1,500-ft. level is decreasing. All of the company's mills, viz.: Brunswick, Morgan, Mexican, Pioneer, Atlas, Petaluma, Sapphire and Rhode Island, are running up to their full working capacity.

BELECHER.—Daily yield, 550 tons of ore, from the 1,000, 1,200 and 1,300-ft. levels. The ore breasts are looking fully as well as usual. The winze from the 1,400 has been sunk west of the ore body to the depth of 30 feet. All the machinery of the mine is in the most perfect working condition possible, and the indications never were better for a long, prosperous, and dividend-paying run.

IMPERIAL-EMPIRE.—Sinking both the north and south winze on the 1,700-ft. level is making steady progress. The main east drift on the 1,850-ft. level is indicating a near approach to the ledge.

LADY WASHINGTON.—Slow progress has been made during the past week, owing to the heavy flow of water in the shaft, which is more than the present pump is capable of handling. New and more powerful pumping machinery has been ordered from San Francisco.

INDEPENDENT AND OMEGA.—Negotiations are about completed for the erection of new hoisting works, and large and powerful machinery for sinking the new shaft already commenced. **CHAPIN AND EAST COMSTOCK.**—The new hoist-

ing machinery continues working finely; the water is all out, and sinking at the bottom of the shaft is resumed. The shaft is 162 feet deep to-day.

CALIFORNIA.—Driving the north drift on the 1,300-ft. level, to connect with the south drift on the same level from the Ophir, is making rapid progress. The drift south from the Ophir is also making good headway.

MCMEANS.—A contract being let for that purpose, work was resumed in this mine, running the main tunnel farther ahead.

CHOLLAR-POSTOL.—Daily yield, 95 tons of ore, the assay value of which is \$29 per ton.

JULIA.—The main southwest drift on the 900-foot level, has penetrated the ledge a distance of 12 feet during the week, in fair grade ore, with prospects of a gradual improvement as the work progresses.

NEVADA.—The south drift shows about three feet of good milling ore in its face, being something of an improvement over last week. The ore itself also is of an improved character. The east cross-cut is through the ledge, showing it to be nearly twenty feet wide, all good milling ore.

SOUTH STAR.—The requisite timber for commencing the shaft is secured, and an attempt was made to haul it to the mine, but the state of the road prevented.

SECOO.—The drift for the ledge, from the 300-ft. level of the little shaft, in the canon, is being pushed ahead vigorously, and so also is the sinking of the main shaft, east of the hill.

HALE & NONCROSS.—Sinking the main incline is making rapid progress. There is no change to report of the ore-producing section, on the old upper levels. Daily yield of ore, 40 tons.

DAYTON.—Daily yield, 130 tons of ore, which, with the exception of 10 tons per day, shipped to the Auburn mill, is being reduced at Woodworth's, Devil's Gate, and Briggs' mills. The ore breasts are both looking well, and yielding splendidly throughout the entire mine. A stoop for the extraction of ore has been opened, at a depth of 45 feet in the winze, from the second to the third station level.

GLOBE CONSOLIDATED.—The up-raise from the main tunnel has only about 15 feet more to raise, to connect with the bottom of the winze from above, which will give a fine circulation of good air, and greatly facilitate the progress of the work in that part of the mine. Stations are being opened, and cross-drifts run at different points, in the raise, to aid in extraction of ore, whenever the company are ready to commence the prosecution of that portion of the work.

SAVAGE.—The main southwest drift, at the 1,900-ft. station, which is being run to connect with the north drift, from the bottom of the south winze, from the 1,700-ft. level, is making slow, though steady headway. The heat in this drift is intense, but it is expected that connection with the winze, will be completed by next Monday, which will give a much needed ventilation.

OVERMAN.—Driving the main west drift on the 1,200-foot level is making good progress, the face still in hard blasting rock. The prosecution of the north drift from the 200-foot station in the winze is stopped for the present on account of a slight flow of water from the face.

NEW YORK CONSOLIDATED.—Re-timbering and enlarging the shaft to make room for the new pumping machinery has been completed during the week for a distance of thirty feet. The four new boilers, which are being manufactured in San Francisco, will be ready for shipment in about eight days.

SILVER HILL.—The ore stopes between the first and second levels north of the shaft are looking well and yielding the usual amount of good milling ore. The south drift at the second station, is being pushed steadily ahead, following the vein of white quartz recently struck, which appears to be widening out and giving promise of a good development.

SIERRA NEVADA.—The drain tunnel to connect with the shaft is still driven vigorously ahead. The prospecting work in the old Sacramento ground has been temporarily stopped, but will be resumed again in a very short time. The drain tunnel to connect with the proposed hydraulic works, is being pushed to completion as fast as the nature of the work will admit. Daily yield of ore, sixty-five tons, keeping the mill steadily running.

SOUTH COMSTOCK.—The main east drift, at the 150-foot level, reached the east wall yesterday morning. It shows the ledge to be thirty-four feet wide, all sound quartz, giving low assays, with the exception of a fine streak of brown sulphuret ore near the west wall, which gave very good assays. The general prospect is excellent and very encouraging, and the company have not yet decided whether to sink for a level one hundred feet deeper, or to follow the sulphuret streak at the present level.

OPERA.—Sinking the south winze from the 1,455-foot level, to connect with the main south drift on the 1,700-foot level, for the purpose of ventilating the two levels, is making good progress. Work progressing at all points as usual.

LEO.—The main tunnel or adit, following the lead into the hill, shows a fine streak of ore, from one to two feet thick on its face, which, during the week, has given assays ranging from \$57.70 to \$184.71 to the ton. The ledge matter continues wide between the walls, and the prospect of finding a good chimney of pay ore is very good. The ore in the stopes, above the adit level, is still looking finely.

GOUTA & CURRY.—The flow of water has been so steady from the face of the main north drift, on the 1,500-ft. level, and the heat so great, that

The Silver City Mines.

Many persons, familiar with the region, says the *Enterprise*, are fast becoming firmly grounded in the opinion that Silver City is destined to become, at no distant day, one of the liveliest mining camps in the State. She is certainly, at present making rapid strides in that direction. Many residents of the town have always had the strongest faith in the value of their neighborhood as a mining region, and have always stoutly maintained that the

Hidden Wealth.

In that vicinity would one day be developed to the enriching of thousands; but the town has never contained men of capital, who were, either by occupation or inclination, fitted to undertake any manner of mining enterprise. With the exception of a few merchants and millmen, the inhabitants of the town are, and always have been, men of moderate means. Particularly has this been the case with the miners of the town, and the men who were inclined to venture into mining enterprises. For this reason this district has been so far neglected, until quite recently, as to leave it about where it was in 1860. Save the sinking of a few shafts to the depth of eighty or one hundred feet, it was almost an unprospected region. No rich companies took hold there, as here, and sunk large first-class shafts, to the depth of hundreds of feet.

The Old Circular Shafts.

Looking like as many wells, were all that was to be seen in the district. Now, however, under the impulse of capital, the wealth of the place is beginning to be developed. Mines are being opened in which crowds of men and employment, and yet these, the leading mines of the district, have attained no great depth. The Dayton is down 400 feet, the Buckeye about the same, and the Silver Hill about 360. On the Comstock, in the vicinity of this city, such depths would be counted as a mere nothing, and it would hardly be thought while to run off prospecting drifts until a greater depth had been attained. All about Silver City—in the town, east, west, north and south of the town—the whole surface of the ground is filled with quartz veins, evidently feeders of

An Immense Vein Running Under the Place.

At a considerable depth. Some of the largest of these are six or eight feet wide in places, while the smallest are not thicker than a knife blade, yet there is not one of these but contains more or less gold; some being exceedingly rich. They run in various directions through the surface, and all are evidently feeders of the big mother vein lying far below. Some of these small veins or feeders, as the old Pride-of-the-West and others, have contained pockets that were astonishingly rich; in places paying very high wages in early days when rudely washed in the common rocker. We might give a list of fifty veins and streaks, great and small, in and immediately surrounding Silver City which, in the early days, had names and were scratched over and "coyoted" into. Being mere feeders, and dodging here and there among the

Faults in the Surface Rock.

The miners who claimed them were unable to follow any but the largest, no matter how rich they might be, to a depth of more than twenty or thirty feet, (often not more than ten), before they lost them by a fault which capped them over and made it seem that they had come to a sudden termination. In following them horizontally they had but little better luck, as in accommodating themselves to the surface rock they split up and vanished in all directions.

What is Wanted at Silver City.

Is that which they have never had—deep mining. We believe that were the Dayton company to run a drift northward from their 400-foot level—insignificant as is the depth—beneath Gold Cañon and in such a direction as to strike in just back of the main street of the town of Silver City, a very large and immensely rich vein would be found—the "mother," into which lead all the feeders covering the surface in a perfect network. A cross drift run west from this main north drift, under the Bacon mill and toward the point of the hill which lies in the forks of the two ravines would be very apt to intersect the rich streaks formerly worked in said hill and pitching to the eastward.

An Excellent Site for a Shaft

And hoisting works, by means of which to prospect much of the best of the Silver City mining belt, would be that formerly occupied by John McCone's foundry. However, once sufficient depth is attained it is easy to drift in any direction, and we predict that when a drift shall be carried northward from the Dayton mine—or from some new shaft sunk to the depth of several hundred feet—into the hill on which the town of Silver stands, richer ore will be found than has yet been seen in the district, and an abundance of it. In this region, gold upon the surface is the best possible indication of silver below, and we believe that all the leading mines about Silver City, at the depth of 1,000 or 1,500 feet, will be found to be highly argentiferous.

There are over 5,000 mines and prospects within a circuit of twenty-five miles of Salt Lake, says the *Tribune*. The most of these will be actively worked this season, and millions of dollars will be added to the wealth of the Territory.

The Sapphire mill, Lower Gold Hill, has started up on Crown Point ore.

Tubular Iron Harrows.

The San José Foundry, at San José, Santa Clara county, and the Petaluma Foundry, at Petaluma, Sonoma county, are both extensively engaged in making tubular iron harrows—a California invention, patented by James Harris, of 216 Perry street, San Francisco. The harrows made on this patent have made a reputation for themselves far exceeding the anticipations of the patentee and manufacturers. The frames being made entirely of iron, and steel teeth being used, the harrows are not affected by the weather, which, in our climate of long, wet winters, and long, dry summers, is a great advantage over those made of wood, since the teeth never become loose and drop out. These harrows are of very light draught, and, being made of round iron, the dirt does not adhere to it and increase its weight.

The advantages of the use of iron over wood

BENT TUBE HARROW.

in agricultural implements is nowhere more apparent than in California, since the peculiarities of the climate are such that wooden implements are soon used up. This particular class of implement is especially liable to become

V-RAKE HARROW.

rickety, since it is used only for a short time, at stated periods, and then laid away. The cuts shown on this page show the three forms of harrows made under this patent by the manufacturers. Their lightness and simplicity will at once be seen. The inventor has a great

STRAIGHT TUBE HARROW.

number of testimonials, referring to the efficacy of these harrows, most of the farmers stating it as their opinion that the yield of grain is increased by using them, more especially when sown in rough land. Several patentees have already adopted Mr. Harris' patent on tubes in their harrows, and he offers it to others for a small consideration. These harrows have now been thoroughly tested, and the tubular iron has proved to be the best material that can be used in the construction of these implements, as it does not warp, check, or loose the teeth. Although an improvement on old styles, they are sold just as cheap.

A STRIKE IN THE HODGDON.—The Eureka Sentinel learns from Nate Diamond that an important development has recently been made, in the Hodgdon mine at Secret Cañon. A body or ledge of mineral, five feet thick, has been disclosed, which is esteemed of great value, as it assays well up into the paying figures. The strike was made in the old workings of the mine. The Hodgdon is one of the oldest mining claims in Secret Cañon, and now bids fair, from all accounts, to take rank as among the best in that locality. The late development was made under the direction and supervision of Boh Mitchell, an experienced miner and superintendent in Eastern Nevada. We are glad to chronicle this favorable streak of luck in the Hodgdon, and the owners of that old-time claim will merit success. They have worked their favorite mine with the utmost vigor for years, and now that it is showing so well, they will doubtless reap a rich reward for their industry and perseverance.

Bingham Canon Items.

We take the following items from the Salt Lake Tribune of the 17th:

The Utah Concentrating Works, which are of very large capacity, have been completed within the last few days, and are ready to commence operations. The building, which covers a considerable extent of ground, is furnished with a large boiler, engine and furnaces, and a new and complete set of machinery, with which to concentrate and separate their ore, much of which has heretofore proved refractory. If the new process succeeds as well as is expected, the property of this company will rapidly enhance in value, and the stock will rise in the London market, from its present low figure.

It is rumored that large concentrating works will be erected during the coming summer, at a few hundred yards below the store of Duncan

& McKee, about a mile and a half above town. There is plenty of water for all purposes, and being directly on the main road, which leads from the principal mines. This locality is one of the most eligible for an

establishment of the kind, in the whole cañon. One of the features of Bingham this season is the influx of Chinamen, who are engaged in working placer mines on their own hook. One claim was sold out to a party of them, a short time since, for \$4,000, and there are about

twenty of them employed upon it at the present time, and although it is impossible to ascertain what they are making, they are evidently well pleased with their purchase. A number of other Chinamen are reported as being on their way from Montana and California, to make investments, and the owners of gravel diggings are running bed-rock tunnels, and opening prospects ready for examination, when they do come.

The road down the cañon is much better than would be expected by a stranger, and the hauling of ore can be carried on as readily as in the summer. There is but little snow, and the road, although somewhat hard and smooth, is entirely free from dust, which is a great annoyance both to animals and teamsters during the dry season. The common idea of blockade in Bingham during the winter, and the cessation of mining operations is incorrect in toto, and as far as the climate is concerned, the atmosphere is so dry and elastic that to most constitutions, it is preferable to the damp and sloppy thoroughfares of Salt Lake city.

RESE RIVER.—It is gratifying to be able to state that at no time in the history of Reese river district has the mining outlook appeared as flattering as at present. The mines on Lander Hill are turning out a large amount of rich ore, and have large quantities in sight. At Yankes Blade, New York Cañon, etc., a great deal of good ore is being produced; and, as a rule, chloridizers are doing well and making money. We are safe in saying that the hullion product for 1874 will exceed that of 1873, by fully one-half.

Napa County Quicksilver Mines.

A correspondent of the Napa Register writes as follows, concerning several quicksilver mines in Napa county.

Great Western Mine.

Mr. Green, the Superintendent, gave us a cordial welcome, and showed us through the works. They are using the Lockhart furnace, and turning out a large amount of quicksilver.

After inspecting the works we were shown the exoavation which has been made preparatory to the construction of a 30-ton furnace of Mr. Green's invention. We were placed in charge of Mr. Kerr, the obliging foreman, and started upon an inspection of the mine. Entering a tunnel known as the first level, with a candle placed in our hands, we followed our guide, and after proceeding about 100 feet, came to the ore, which appears above, below, and to the right and left of us. We went on to the right and left, up hill and down stairs and shafts, till we began to think ourselves a gone correspondent; but our guide told us never to fear, and we should come out all right. So we confided in him and on we went. At last we came to what we supposed to be the end of the tunnel, when Mr. K. suggested that we should now go down to the lower level, and down we went. In making this descent we thought of our wife and babies at home, mentally bidding them good-bye, but after a long lapse of time, which appeared like an age, we struck bottom. We then traversed another tunnel, and after a while, greatly to our surprise, came out into daylight on the opposite side of the mountain. The mine has over 2,000 feet of tunnel, and many shafts, and throughout they appeared to be cut in a solid mass of cinnabar.

After getting a few subscribers for the Register, and thanking Messrs. Green and Kerr for their kind attention, we proceeded to the

Lake County Mine.

Which adjoins the Great Western. Mr. J. Siebeck, the Superintendent, showed us through the grounds, which are mostly yet undeveloped. It is here that poor Mr. Eastman met with his death, by the caving of the mine. The prospect is that the Lake mine will be a valuable piece of property. Returning to

Middletown.

We remained over Sunday, and had a chance to see what the people were doing. Mr. E. Ford has built a comfortable house and saloon. Daly & English are doing a thriving business in the meat line. G. W. Sacra has opened a store in the first story of the Odd Fellows' Hall. Yesterday we left to visit the mines on Pine mountain, and being armed with a letter of introduction to Mr. Paull, the forsmen of the

Kearsarge.

Placed ourselves under his guidance. We climbed up the mountain about a quarter of a mile to the mouth of the tunnel, and lighting candles, went in for a distance of 270 feet. At that depth they have every evidence that the main ledge is struck. Just above this, is another tunnel called No. 1, in which the cinnabar deposit is struck at the depth of 40 feet. Native quicksilver glistens all over the walls of the tunnel, and there seems to be no doubt that the Kearsarge is a rich mine. The owners feel confident that they have a "big thing." About half a mile from here is the

America.

formerly known as the "Dead Broke." This mine, for a year or two back, has been owned and run by Mr. J. Perschbacher. It is now owned by Cross & Company of San Francisco. We did not enter, as we saw a sign "No Admission," at the mouth of the tunnel, which looked as though they meant us. Mr. James, the Superintendent, was absent, and we did not press ourselves upon the men. On the dumps we saw a fine lot of ore. We proceeded up Pine mountain footsore, and anxious to find a resting place. We passed the American Company's saw mill, and in half a mile more reached the summit of the mountain.

A beautiful sight met our gaze. We could in one view behold Knight's Valley, Napa Valley, Russian River Valley, and the Pacific Ocean. Turning around we could see Middletown, Coyote and Pope valleys and Cobb mountain, and as we stood there entranced by the magnificence of the scene, we thought that if we could wield a pen like "Curioso," or even Bret Harte or J. Ross Browne, we would like to stop there and do up a little scribbling; but, knowing our inability, we rushed down the mountain to the

Finlay Mine.

Which has just been sold by Messrs. Gettleston & Company, J. M. Finlay and Mr. Siebert, to a San Francisco company for \$32,000. Passing this we soon arrive at the famous

Bloodhound.

Or Georgia mine, where we were made welcome and staid over night, arriving at Pine Flat this morning—and here we are in the midst of a heavy rain storm. Of the mines here, we will give a full account next week.

NUGGETS.—A nugget weighing 134½ oz. of pure gold has been found at Welcome Lead, Brehman's, Australia, and a 70 oz. nugget a day or two before. Another splendid nugget weighing 152 oz. 8 dwts, has been unearthed in the Slow-and-Sure claim, Napoleon's. The nugget was sold in Ballarat for \$288 15s.

GOOD HEALTH.

Reading to the Sick.

Florence Nightengale gives the following judicious advice on this subject: With regard to reading aloud in a sick room, my experience is that when the sick are too ill to read themselves, they can seldom bear to be read to. Children, eye-patients, and uneducated persons are exceptions, or where there is any mechanical difficulty in reading. People who like to be read to, have generally not much the matter with them; while in fevers, or where there is much irritability of brain, the effort of listening to reading aloud has often brought on delirium. I speak with great diffidence, because there is an almost universal impression that it is *sparring* the sick to read aloud to them. But two things are certain:

(1.) If there is some matter which *must* be read to a sick person, do it slowly. People often think that the way to get it over with least fatigue to him is to get it over in least time. They gabble; they plunge and gallop through the reading. There never was a greater mistake. Houdin, the conjurer, says that the way to make a story seem short is to tell it slowly. So it is with reading to the sick. I have often heard a patient say to such a mistaken reader, "Don't read it to me; tell it to me." Unconsciously he is aware that this will regulate the plunging, the reading with unequal paces, slurring over one part and neglecting of leaving it out altogether, if it is unimportant, and mumbling another. If the reader lets his own attention wander, and then stop to read up to himself, or finds he has read the wrong bit, then it is all over with the poor patient's chance of not suffering. Very few people know how to read to the sick; very few read aloud as pleasantly even as they speak. In reading, they sing, they hesitate, they stammer, they hurry, they mumble; when in speaking they do none of these things. Reading aloud to the sick ought always to be rather slow and exceedingly distinct, but not monotonous—rather monotonous, but not singsong—rather loud, but not noisy—and, above all, not too long. Be very sure of what your patient can bear.

(2.) The extraordinary habit of reading to one's self in a sick room, and reading aloud to the patient any bits which may amuse him, or more often the reader, is unaccountably thoughtless. What do you think the patient is thinking of during the gaps of non-reading? Do you think that he amuses himself upon what you have read for precisely the time it pleases you to go on reading to yourself, and that his attention is ready for something else at precisely the time it pleases you to begin reading again? Whether the person thus read to be sick or well, whether he be doing nothing or doing something else while being thus read to, the self-absorption and want of observation of the person who does it is equally difficult to understand, although very often the reader is too amiable to say how much it disturbs him.

Over-Eating—Scientific Cooking.

Turgot could not work well till after he had dined copiously; but many men cannot think after a substantial meal; and here, in spite of the example set by Scott and Goethe, let us observe that nothing interferes so much with brain work as over-eating. The intellectual workman requires nourishment of the best possible quality, but the quantity ought always to be well within the capacity of his digestive powers. The truth appears to be, that while the intellectual life makes very large demands upon nutrition—for cerebral activity cannot go forward without constant supplies of force, which must come ultimately from what we have eaten—this kind of life being sedentary, is unfavorable to the work of digestion. Brain-workers cannot eat like sportsmen and farmers without losing many hours in torpor, and yet they need nutrition as much as if they had led active lives. The only way out of this difficulty is to take care that the food is good enough for a moderate quantity of it to maintain the physical and mental powers. The importance of scientific cookery can hardly be exaggerated. Intellectual labor is, in its origin, as dependent on the art of cookery as the dissemination of its results is dependent upon paper-making and printing. This is one of those matters which people cannot be brought to consider seriously; but cookery, in its perfection—the great science of preparing food in the way best suited to our use—is really the most important of all sciences, and the mother of the arts. The wonderful theory that the most ignorant cookery is the most favorable to health, is only fit for the dark ages. It is grossly and stupidly untrue. A scientific cook will keep you in regular health, when an ignorant one will offer you the daily alternative of starving or indigestion.—*Herald of Health*.

GLYCERINE IN ASTRINGENT INFUSIONS.—Glycerine has been successfully used for rendering astringent infusions bright. One part of glycerine to nine of infusion of roses is said to be efficient. Mixtures of infusion of rosea and sulphate of quinia, in which a precipitate of tannate of quinia is produced, may be rendered transparent by a similar addition, as also gargles composed of tannic acid and infusion of rosea.

Carbonic Acid Not a Poison.

Dr. Van der Weyde has published a paper containing some very extreme views on this subject. He says: For some time the opinion has become prevalent, among many chemists, that most cases of poisoning usually ascribed to carbonic acid are due to carbonic oxide, the product of imperfect combustion of coal. It is argued, 1st. That if carbonic acid were a poison we would continually be inhaling a poisoned atmosphere, as good air always normally contains one-tenth of one per cent. of this substance, and may contain much more without being injurious to the system. 2d. That the cause of the unpleasant effect of air in a close room, after having been breathed by many persons present in the same, is due to other exhalations—perspiration, flavors, etc., of this different constitutions, and not to the carbonic acid. 3d. That pure carbonic acid only intoxicates, and in this way makes the persons insensible; while, when they are made to breathe pure air afterward no unpleasant effects remain. 4th. That death in those cases of committing suicide by means of a furnace of burning charcoal in a close bed-room is caused by the carbonic oxide produced by the imperfect combustion of the charcoal by the insufficient amount of oxygen in the room, and not by the carbonic acid—carbonic oxide being acknowledged as a virulent poison, of which the presence in the air in a quantity of less than one-fiftieth of one per cent. causes a series of alarming symptoms.

As a companion to this change of opinion comes the announcement of M. P. Bert, who has found that when pure oxygen is inhaled under a pressure of four atmospheres, or more, it becomes a most virulent poison; while common air breathed under a pressure of twenty atmospheres kills, not so much by the mechanical effect of an increase of pressure, to which an animal soon accommodates itself, but to the concentration of the oxygen present in the air to a bulk so small that twenty times as much comes in contact with the surface of the pulmonary cells, as is the case in the normal condition.

In reviewing Dr. Van der Weyde's paper, Professor Wurtz, editor of our valued exchange, the *Gazette*, indorses the position advanced and adds that in his own case, speaking as a chemist, no "change of opinion" has occurred on the point of the non-toxic nature of carbonic acid; as he is not able to remember the time when he was willing to admit it to be a poison, in the true sense of that term.

Cleansing Garments by Heat.

A garment can be freed from odors by exposing it to heat for a few hours. Thus, body and bed-clothing, and indeed all vestures, may be rendered fresh and clean. It is only the odors, and not what remains after they are expelled, that makes the foulness in a garment. Any substance deprived of them cannot be considered filthy or dirty in the true sense. Ground is not offensive, nor wood, nor the metals, nor any texture in its pure native state. It is decomposition that causes the mischief—a rotten carcass, decayed vegetation—it is the essence of these that we bear about in our filthy garments, in our rooms, our bed-clothing, etc. The exhalations and excrementitious matter of the body come under the same head, made worse by decomposition, which readily takes place. Soap and water will remove these more effectually when heated. Heat alone—dry heat—will remove the odors, which are thus sent off in a volatile state. It requires only what the texture will bear to do the work satisfactorily. These bed-clothing may be used, and body garments worn longer, by ventilating with heated air. The obnoxious odor may be removed effectually by exposing for an hour or two to heat.

Why, in view of this, may not a room be fitted expressly for this purpose, or some other room temporarily employed? A few hours' exposure will, in general, be sufficient. Clothes thrown off at night may thus be treated; bed-clothes an hour or two during the day. The sun in its mid-summer fervor, when the air is dry, is a good renovator, but the heat is not strong enough to do it entirely satisfactorily. Garments will bear a much stronger heat.—*Country Gentleman*.

PULMONIC CANDLES.—Under this name, Field & Co., the great English chandlers, have introduced candles containing in their substance some of those gum-resins and balsams, especially benzoin and storax, which from time immemorial have proved useful in chronic bronchitis, and allied maladies. When burnt, the candles yield, by the combustion of these drugs, a pleasing fragrance, and at the same time give a good light. Candles are not much used in this country, but we should not be surprised if some enterprising Yankee adopted the idea to the medication of kerosene; which may thus be compelled to make partial amends for the slaughter it has caused. The aromatic odor alone would be an improvement of the unfragrant combustibles.—*Jour. of Chem.*

A GERMAN chemist has discovered that one of the eatable mushrooms, *Agaricus oreades*, emits, even when freshly gathered, a notable quantity of hydrocyanic acid. After cooking, however, the cryptogam is not poisonous.

USEFUL INFORMATION.

A Day's Work.

The amount of work that a man can do in a day has been the subject of no little investigation and discussion. Some writers on physiology have unquestionably set the average too high, while others have erred in the opposite direction. Among the estimates given by the best authorities, however, there is no very marked discrepancy, and the question may now be considered as quite accurately answered.

In comparing different kinds of muscular labor, it is necessary to fix upon some convenient unit to which they may all be referred. The force required to raise one pound one foot, or a "foot-pound," as it is concisely expressed, is the "unit of work" commonly employed in England and this country. In France, the lifting of one kilogramme (about 2.2 pounds) to the height of one metre (39.37 inches) is taken as the unit. This "kilogrammetre," as it is called, is equivalent to 7.216 foot-pounds. The "foot-ton," which is often mentioned in connection with estimates of this kind, is the force lifting a ton of 2,240 pounds one foot, or one pound 2,240 feet, which is, of course, virtually the same thing.

Now, if a person unfamiliar with these calculations were asked how many foot-tons he considered a fair day's work for an able-bodied man, he would not, probably, guess very wide of the mark. It has been stated in books as high as 1,000 foot-tons, but this is at least twice too much, 500 foot-tons being in reality a daily "stint" which very few laborers could keep up from week to week. Four hundred foot-tons is a hard day's work, and 300 an average day's work for a strong man in good health. Dr. Parkee, who has given much attention to this subject, says that the hardest day's work of twelve hours that he has personally known a man to do, was in the case of a workman in a copper-rolling mill, who stated that he occasionally raised a weight of 90 pounds to a height of 18 inches 12,000 times a day. Assuming this to be correct, the work done would be equivalent to 723 foot-tons. The same man's ordinary day's work, which he considered extremely hard, was raising a weight of 124 pounds 16 inches 5,000 or 6,000 times in a day. Taking the larger number, this would be 442.8 foot-tons.

Conlomb reckons a day's work at pile-driving as 312 foot-tons; Lamande finds it, in another case, to be 352 foot-tons. The work done by porters was calculated by the former authority, in a variety of instances, to be from 303 to 331 foot-tons. Dr. Parkee has known an Indian coolie to travel 30 miles, with an ascent of 5,000 feet, in three days, carrying a load of 80 pounds; which would be at the rate of 500 foot-tons a day.

The work done in walking is greater than many persons would suppose. Rev. Mr. Haughton, to whose elaborate investigations in animal mechanics we have more than once referred in the *Journal*, has shown that walking on a level surface is equivalent to raising one-twentieth part of the weight of the body through the distance walked. In going up-hill a man, of course, raises his whole weight through the height ascended. If a man weighs 150 pounds with his clothes, the work done in walking a level mile is 17.67 foot-tons; for 10 such miles, 176.7 foot-tons; for 20 miles, 353.4 foot-tons. One can readily calculate what the labor would be for a man of different weight or for one carrying a given load. It will be seen that a walk of 20 miles on a level road is a good day's work, and there are comparatively few persons who can keep up such a "tramp" for many days in succession. For a soldier, carrying 60 pounds, a day's march of from 10 to 12 miles is fair average work, being from 247.5 to 297 foot-tons, even if the ground is level.

In these estimates it is assumed that the work is done in the easiest manner for the person concerned, especially as regards the time taken for it. If the time is shortened beyond certain limits, the work becomes more exhausting, on account of the greater strain on the heart and lungs. In a boat-race, rowing at the rate of a mile in seven minutes, the work done in that time is between 18 and 19 foot-tons. This is apparently not a great exertion, but it is very severe for the time, from its effect on the circulatory system.

This reference to the strain upon heart and lungs reminds us to say, that in these remarks upon muscular labor, we have dealt solely with "external work," as it is termed, in distinction from "internal work," or that done by the muscles concerned in respiration, circulation, digestion, and other vital processes. We have before given some facts and figures in regard to the work done by the human heart. The sum total of the mechanical labor performed within the body averages, according to careful estimates, about 260 foot-tons every 24 hours. To this part of the work accomplished by the wonderful machinery of our human organism, and also to the sources whence its motive power is derived—the fuel that feeds its furnaces and keeps up the steam in its boilers—we shall recur at some future time.—*Boston Journal of Chemistry*.

TO DISSOLVE GLUE.—It is said that if one part of sugar is dissolved in three parts of water, and digested with one-fourth part of calcic hydrate, the resulting liquid will readily dissolve glue warm, and the solution will remain fluid on cooling, without having lost any of its adhesive properties.

Fire-Proof Construction.

As a precaution which may be used in lessening the tendency to catch fire in buildings which are not in their nature actually non-inflammable, or intended to be so, it is very desirable, whenever timbers are exposed, to cover them with a coating of common whitewash, which acts doubly as a preservative, both by excluding air from the timber, and from its non-conducting power. This will, of course, be of no use when a fire has once been kindled and got to a head; but, in case of fire, seconds of delay in kindling it or communicating it are of vital importance. In many a workshop or factory, if the floor and roof timbers were kept well whitewashed, the risk would be much diminished. Special precaution should be taken about the floors and fireplaces: there is frequently great carelessness in trimming joists and fixing ground for skirting, etc. It would be very desirable always to skirt chimney-breasts in cement or plaster, and to fill in the place under the hearthstone with cement concrete. Ceilings, again, should be formed with much stronger laths and better nailed; and if about 2 in. of rough mortar, the coarser the better, were laid over the laths between the joists, it would be found very difficult to set fire to them—they would resist for a considerable time even a fierce fire underneath. Again, all rooms should have a good light, otherwise the constant operation of gas-lights is to prepare the timber of the ceiling for combustion on the most rapid scale, if the opportunity be once given. As regards all stoves, great attention should be paid to their being so arranged as to avoid all risk arising from the heat of the stove itself, its fine-pipe, or its ash-pan; no stove should be considered safe, the fine-pipe of which cannot be heated to redness with perfect safety to the building. But in all ordinary buildings the most important point to attend to is the staircase; it should be, if circumstances will admit, closed at top or bottom, cut off from the passage leading into the rooms, and in the construction of it, it is very desirable to lath the soffits with extra strong laths, and fill in from the upper side with concrete, so that all the space at the back of the riser and under the tread shall be a solid mass of non-inflammable material. Such a staircase would probably stand and bear the weight of persons ascending and descending under circumstances where an iron or stone staircase would be destroyed or useless.—*Builder*.

TO DEADEN THE SOUND OF AN ANVIL.—The *Building News* recently remarked upon this subject: "If a chain about one foot long, formed of a few large links, is suspended to the small end of an anvil, it will destroy, we are told, that sharp thrilling noise produced by striking on it with a hammer; the vibrations of the hammer are extended to the chain, which absorbs them, without producing any sound. This is worth trying by any one who has a blacksmith or a coppersmith for a neighbor." [We presume it is intended to suggest that the smith should be induced to use the chain, and not the neighbor; but with reference to this application to the back of an anvil, we may tell our contemporary that, were a chain suspended in that way, the labor of the mechanic would be painfully increased, for the hammer would fall heavily and flat, without that spring or rebound that the active vibration gives to the hammer, and the brawny arm of the smith would be called upon to lift a dead weight every time he struck the iron; instead of having only to catch up the rebounding tool and direct its next blow. For our part, we think there is a very musical sound in the anvil, and certainly can not recommend the use of the chain.—*Iron Monger*.]

COLORING MATERIALS BY WHICH GEMS ARE IMITATED.—The basis of these imitations is a soft white lead glass of highly refracting power, called strass. For imitating topaz, glass of antimony, 37 parts, and purple of Cassius, 1 part is added to 840 parts of strass, or 1 part of orosus martis to 100 of strass. For ruby, the above is fused for 30 hours, or oxide of manganese is used. For emerald, add 250 parts of strass, 2 of verdigris and half a part of orosus martis. For sapphire, add 1 part of oxide of cobalt. In all cases a careful fusing in furnace or blow-pipe is required of the substance before hand, well powdered and mixed; but above all, a considerable degree of experience, obtained by continued practice.—*Manufacturer and Builder*.

NEW USE FOR INFUSORIAL SILICA.—Infusorial silica has been strongly recommended for snoring, ice, ale, and beer cellars, fire-proof safes, steam boilers, and powder magazines. A firm in Germany have recently made a series of experiments on a large scale, and they assert that the use of this earth has reduced the melting of ice in a cellar during the summer from 23,500 to 10,000 pounds. This material is not inflammable, and is not in the least affected by the hottest fire, and it prevents the entrance of rats and mice.—*Scientific American*.

An excellent cement, it is said, may be made from rice flour. It is only necessary to mix the rice flour intimately with cold water and gently eluminate it over a fire, when it readily forms a delicate and durable cement. When made of the consistency of plaster, clay models, busts, bas-reliefs, etc., may be formed from it.

MINING AND SCIENTIFIC PRESS.

W. B. EWER, SENIOR EDITOR.

DEWEY & CO., Publishers.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Iron Fastened Wood Pavement; Mine Ventilating Machine; Approaching International Exposition; Copper, 193. Tubular Iron Harrows, 198. Geological Survey; Protection to Stockholders; Laws the Miners Want, 200. Home Inquiries; Vessel for Measuring and Drawing Liquids; Self-Pumping Well-Boring Drill, 201. Mining Affairs at Eureka, Nevada; Patents and Inventions, 202.

ILLUSTRATIONS.—Perrin's Iron Fastened Wood Pavement, 193. Bent Tube Harrow; V-Rake Harrow; Straight Tube Harrow, 198. Corliss' Combined Tank and Liquid Measure; Self-Pumping Well-Boring Machine, 201.

CORRESPONDENCE.—Knox & Osborne vs. Phoenix Mining Company, 194.

SCIENTIFIC PROGRESS.—Molecules; Application of Solar Heat as a Motor, 195.

MECHANICAL PROGRESS.—Hollow Walls; Pneumatic Call Bells; Railway Brakes; A Destructive Engine of War, 195.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notice of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 196.

MINING SUMMARY from various counties in California and Nevada, 196-197-205.

GOOD HEALTH.—Reading to the Sick; Over-Eating—Scientific Cooking; Arsenic Acid Not a Poison; Cleaning Canned by Heat; Glycine in Astriggent Infusions; Pulmonic Candles, 199.

USEFUL INFORMATION.—A Day's Work; To Dissolve Glue; Fire-Proof Construction; To Deaden the Sound of an Anvil; Coloring Materials by which Gems are Imitated; New Use for Infusorial Silica, 199.

MISCELLANEOUS.—Smelting in North Star District; Idaho Mining Notes; Reduction Works of Pelican Mine, 194. The Silver City Mines; A Strike in the Hodgekin; Bingham Canon Items; Reese River; Napa County Quicksilver Mines; Nuggets, 198. How to Get to San Juan; Wood and Lumber Company; New Box-making Machine; Solidification of Silica and Potash by Heat; Glycine in Astriggent Combustion of Hay; Josephine Mining Company; From Panake; Borax; Australian Gold Yield; Iron in Montana; The Stuckien Mines; Longevity of Medical Men; Effect of Refined Air, 202. Antimony; San Bernardino County; Auburn Mill Company, 203.

It is estimated that the number of railroad ties in present use in the United States is 150,000,000. A cut of 200 ties to the acre is above rather than under the average, and it therefore has required the product of 750,000 acres of well-timbered land to furnish the supply. Railroad ties last about five years, consequently 30,000,000 ties are used annually for repairs, taking the timber from 150,000 acres. The manufacture of rolling stock disposes of the entire yield of 350,000 acres, and a full supply of 500,000 acres more every year. It appears, then, that our railroads are stripping the country of timber at the rate of one million acres per annum, and their demands are rapidly increasing.

QUICKSILVER CONDENSER.—It will be seen by advertisement in another column that Mr. F. Fiedeler, of the New Almaden Quicksilver mine, desires to sell the right to use his patent condenser, patented through the agency connected with this office. We gave an illustration and description of this condenser in an issue of Nov. 15, 1873. It has been adopted at New Almaden, and is also in use at other mines, being highly successful in its operation.

THE GRASS VALLEY AND COLFAX R. R.—About \$70,000 has been subscribed toward the Nevada and Grass Valley and Colfax Railroad in Grass Valley, and \$80,000 in Nevada City. The prospect for this railroad is now very encouraging, and the people are feeling very enthusiastic over it.

At a single mine in Cornwall, England, the monthly product of white arsenic is sufficient to destroy the lives of more than five hundred million human beings, and the amount of the poison sometimes stored in its warehouse would probably be enough to destroy every living creature on the face of the earth.

MINING LAWS.—The several mineral land hills, now before Congress, are attracting considerable attention, and will probably be settled, one way or another, next week. The discussions on the hills have been lengthy and general, but as yet no conclusion has been arrived at.

THE GORHAM SILVER PLATE WORKS, in Providence, now employ 450 skilled workmen, and the daily consumption of silver ranges from 2,000 to 4,000 ounces.

The Geological Survey.

Unfortunately, the action of the Legislature has effectually put a stop, for the present, at least, to the State Geological Survey of California. The enacting clause of the act appropriating money to complete the survey, was stricken out. Since that action was taken, a resolution has been passed requesting Professor Whitney to hand over to the State University all specimens obtained by him during the time he has held the appointment of State Geologist. A bill was also passed providing for the collection of specimens, books and documents of the survey, and surrender all of the same to the Regents of the State University. Charles F. Hoffman has been authorized to complete the field work and drawing for a map of the central portion of the State, and a bill appropriating \$16,000 for the purpose has been passed. At the completion of the work he is to deliver 25,000 copies to the Secretary of State, who is to dispose of them at \$6 each.

This, then, is the end of the Geological Survey, for which the State of California has been so much praised abroad. The work already accomplished has been excellently done, and it seems too bad that the whole work could not have been properly finished. It is highly probable, that with any other man at its head, the survey would have been continued; but the people of this State have become dissatisfied with Professor Whitney, and have probably wanted the survey stopped more to get rid of him than anything else. As far as Professor Whitney's integrity and ability are concerned, they have never been questioned by any one who knew him, or knew the work he had performed. But, at the same time, it is thought that he erred in judgment in the manner in which the survey was conducted, and did not possess the necessary business qualifications to entitle him to the position he held.

He made up his mind to carry the survey on in the order which best suited him, and paid no attention whatever to the suggestions of the people. We wanted the map of the Pliocene rivers, which was of practical value to the mining community, and several of the matters of like character attended to first; but the chief of the survey first detailed the more abstruse scientific matters, to the exclusion of what the people considered practical. The books already published are valuable in their way and well arranged and published; but to the general public they are of little interest. In fact, the general public cannot appreciate them, even if they could afford to buy them. The maps already produced by the survey are models of their kind, and well worth the price charged for them. It has been unfortunate for the survey that Professor Whitney's personal characteristics should have alienated from him many warm friends of the survey; and that he did not possess sufficient forethought to understand that it would be to his advantage to be affable and courteous to the public, in whose employ he was.

If he had deferred even in a light degree to the wishes of the community, and devoted more time at first to what is usually considered practical, the more scientific part of his labors might have been accomplished at leisure, and with a liberal appropriation to assist them. As it is the public has gradually come to the conclusion that the chief of the survey has rather ignored them than otherwise, and they have in consequence become prejudiced against him. That this is the case, may be seen by the debate in the Senate on this question—senseless as many of the arguments were.

It has been charged against Professor Whitney in the Legislature that he drew a salary at Harvard, while in the employ of this State; that he expended a great portion of his time there, and that he had given a portion of the State collection to the Harvard University. In answer to these statements he has published the following card which explains itself.

EDITOR MORNING CALL.—Noting that you in a measure seem to indorse a slanderous statement made in the Legislature of California, that I have given a part of the collections of the State Geological Survey to Harvard College, I beg leave to state that this is entirely false, and that I have given no portion of these collections to Harvard, or any other institution or individual. I also state that I never received any salary from Harvard College or from any other institution, or any pay from any individual when under pay of the State; but, on the other hand, I have given more than a year of hard work to the Survey, for which I received no pay whatever. Yours, J. D. WHITNEY.

San Francisco, March 24, 1874.

It must be a matter of regret to every intelligent citizen that this survey has been stopped before it was completed. However, it is highly probable that when there is a more intelligent and better educated Legislature than the present, and a more popular Geologist than Professor Whitney, the work will be taken up and finally completed.

HYDRAULIC mining is threatening the people living on the river bottoms of Placer, Sutter and Yuba counties. The bed of the Yuba river at Marysville is already sixteen feet higher than it was twenty years ago from this cause.

Tin fell in value about £20 per ton in Liverpool during the month of February, owing to the large arrivals of ore from Australia. The Australian tin mines must be making a pretty good show in the market already.

The imports of silver ore into Liverpool during February amounted to 740 tons, and of silver lead ore to about 20 tons.

Protection to Stockholders.

The Bill introduced by O'Connor for the protection of Stockholders in mining corporations has passed the Senate. This bill as amended requires Secretaries of mining companies to make out a statement on the first Monday in January and July, exhibiting all the business and financial transactions of the corporation for the six months preceding, and containing a full description of all the property of the corporation, which shall be verified by the oath of the Secretary, and shall, together with all the books, papers and records of the corporation, be open to the inspection of any stockholder during the hours of business every day in the year, Sundays and legal holidays excepted. Under section 2, any owner of stock to the extent of \$500 shall have the right at all hours of business or labor to enter upon the property of the corporation, either on the surface or under ground, and it is made the duty of all officers or persons in charge to allow such stockholder to enter as described. The penalty for infringement of the Act is fixed at \$200.

This bill will require secretaries of companies to make semi-annual, instead of annual statements, as is now the case. The election which provides that the owners of stock to the value of \$500 shall have a right to go into the mine at any time, though eminently just, will no doubt cause some inconvenience at the mines. People owning shares in mines which are worked for legitimate purposes never find any difficulty in entering them; those which are worked only for stock purposes are sometimes kept closed for reasons best known to the Directors. Still, if only bona fide owners of stock are allowed to enter, it wouldn't make much difference to these directors, for there is not one man in five hundred who deals in stock that knows the ore from country rock unless it is in a glass case and labeled. If a clique of stockholders kept a special expert fortified with the requisite number of shares, to go into the mine and report for them, it might be all right; but that would in a great measure depend on whether the directors or the stockholders had the most "influence" with him.

Moreover, the principal mines dealt in our Stock Board are several hundred miles distant from where the larger proportion of stockholders resides, and very few will ever avail themselves of the opportunity the law gives them.

Another thing is, that the Comstock mines are invariably the ones that stockholders want to get into, and as they are in Nevada, our State law does not affect them. The California mines, which are ever closed to stockholders, might be counted on the fingers of one hand.

All miners know what an inconvenience the presence of visitors is under ground, and this is especially the case where several hundred men are employed, and the mine is in full working operation. However, it will be a source of satisfaction to many to know that they will be able to enter the mines in which they are interested whenever they choose, even if they never have time to go there, and for this reason O'Connor's bill is rather popular.

IRON IN INDIA.—A statement which is of great importance to the iron trade is made by the Indian correspondent of the *Pall Mall Gazette*, who states that in pursuance of a suggestion made by the late Lord Mayo, a practical mineralogist, has been employed to thoroughly investigate the mineral resources of India, more especially its ironstone and coal-fields. In his report just submitted to the Government, he states that he found inexhaustible stores of rich hematite in the Central Provinces, within easy reach of the Chanda-Berar coal-field, and with limestone in the neighborhood. In the north of India he found that the Kumaon iron ore was abundant as to quantity, but inferior in quality, and distant from the great markets. The most hopeful part of his report refers to the Raniganj coal and iron field in Lower Bengal. The iron ores of this locality resemble the clay ironstones of the European coal measure, but are more concentrated and very cheaply worked. They are within 125 miles by railway to Calcutta. Labor is abundant, and the district is well supplied both with roads and food material for a working population. Goal is already so extensively raised on the spot as to have reduced prices almost below a remunerative point in the present state of the market. The report is merely a preliminary one, and Lord Northbrook has, in a public resolution, declared the necessity of further enquiry, and "considers it of great importance that iron manufacture should, by some means, be established on a large scale in India." He orders the subject to be further carefully investigated by the Geological Survey and other departments concerned.

The Russian Government has offered an order for 450 locomotives to three Russian establishments—the works of General Maltzoff at Briansk, the Koloma works of Messrs. Struve Brothers at Moscow, and the Alexandrowsky works on condition that everything required, iron, brass, etc., be produced exclusively in Russia.

"WHITE COAL" has recently been discovered in Australia. It consists of felted vegetable fibres like peat, with fine grains of sand interspersed. It burns easily with a light flame, exists over large tracts, and is already extensively used. There is a yellowish white coal in Brazil, looking like clay, but burning well.

The Laws the Miners Want.

A communication which appeared in our issue of March 14th, by Julius S. Lloyd, on this subject, has attracted considerable attention. If our legislature would go into the mining regions and talk with practical men, they might become very much enlightened on the subject of mining laws, and learn of some of the defects of the present system. Among the numerous suggestions concerning Mr. Lloyd's article we have received, is one from "F. S." of West Point, Calaveras county, Cal. He says: "I suggest, as the preliminary step in the right and final direction, that the Federal Government offer a prize for the best code of mining laws, applicable to all mineral lands of the United States—say \$5,000 for the best, \$3,000 for the next, and \$2,000 for the third best."

The States and Territories interested should offer additional prizes and facilities for thorough investigation and deliberate adoption of such laws.

The incalculable beneficial results of such offers will be obvious to the most apathetic. The new code should be terse, free of ambiguity, and cover all present and future exigencies.

The mining fraternity of this State constitute only about one-tenth of its population, but its products equal those of agriculture. Why should not, then, the State and Federal Government extend to us at least a portion of that fostering care which they bestow so tenderly on our agricultural brethren?

Mr. A. P. Frary, of the Stonewall mine, San Diego county, California, says: "In your issue of the 14th instant, in an article written by Julius S. Lloyd, are some very good suggestions for mining laws. I am glad to see miners disowning these matters, for certainly they know what we need better than Mr. Ward, or even Sargent. The third section, which Mr. Lloyd thinks should be enacted, is as follows: 'A claim shall not be subject to relocation or jumpable, as long as the number of hundreds of dollars of bona fide labor equals or exceeds the number of years since located; that is, \$200 shall hold a claim two years; \$400, four years; \$500, five years, etc.; but in no case shall a claim hold good seven years without labor.' Lloyd's article 3d, in my opinion, should make all claims jumpable in four years after work has been entirely stopped, instead of seven."

There have been many mining claims partially prospected, and large amounts spent upon them, which have been abandoned by the original parties, and they have left for parts unknown; and, in many cases, heavily in debt, and not likely to return. It is, in my opinion, a damage to the country to let such mines lay idle longer than four years. Let us, by all means, as suggested in Provision No. 7, have the County Recorder, a responsible party, to keep record of our claims and mining laws. Then, when we come into Court, we can find our laws and records without trouble, and not be subject to the carelessness, neglect or villainy of an irresponsible recorder. I have felt the full force of this suggestion, having been sued for \$150,000, where the issue depended upon the Mining Record, and that Record in the hands of my enemies. The suit has been adjusted, but the Records are still missing. We were, of course, obliged to record, in the County Recorder's office. Let us have Lloyd's suggestions with the amendment.

OPENING ROADS IN THE SIERRA.—None save those who are personally familiar with the expense, toil and danger of breaking roads through from five to ten feet of snow, can form an adequate idea of the task devolving upon individuals in this Alpine region. Lumbermen, having mills situated three or four miles from Truckee, have been obliged, after every storm, to turn out with from 20 to 40 yoke of oxen and open communication with town. Thousands of dollars' worth of labor has thus been expended the present winter by our lumbermen. In breaking these short roads, however, there is no special danger to life or health; but in opening communication with Randolph or Loyalton, Sierra valley, or points on Lake Tahoe, where the distances range from 15 to 25 miles, there is real danger. Between Truckee and Sierra valley there are but two or three stations on the route; and none between Truckee and Hot Springs. Parties while at work on these roads, forcing a passage through from six to ten feet of snow, have frequently been enveloped in blinding storms and overtaken by darkness, when it was impossible to get ahead, and extremely difficult to effect a safe retreat. On more than one occasion this winter, these hardy road-breakers have been forced to remain out all night without food or shelter. *Truckee Republican.*

The gold fields of South Africa, which at first disappointed the expectations of the original discoverers, of late have yielded the miners more profitable returns. The most of the gold is in reefs, and extensive veins of gold-bearing quartz have been found, which will probably pay well when they come to be worked by companies having suitable quartz-crushing machinery. But, recently, alluvial gold fields of wonderful richness have been discovered, and these are attracting crowds of gold-seekers, natives as well as Europeans, from all parts of South Africa. Stories are told of nuggets found there, weighing from 16 ounces to two pounds; and it is reported that one fortunate miner secured a nugget weighing 45 ounces.

Both gold and silver mines have been discovered in the hills directly north of Carson City.

Another Home Industry.

The Union Box Factory.

The interest, and apparent anxiety, manifested by the public in regard to our home manufactures, may possibly convey to outsiders the impression that the condition of San Francisco is rather deplorable than otherwise, in regard to this great element of prosperity. But while we heartily join with those who are most clamorous for more, we are not disposed to allow establishments that have done much toward supplying this great want to remain unnoticed. While we are urging capital and enterprise to embark in manufactures, we should not fail to recognize and duly honor the merits of those who ventured to pioneers in local manufacturing, and are now enjoying deserved success.

Swan & Co., Union Box Factory, is among the most noted and successful of our home industries. It was started in 1870, on a scale of not one-quarter its present capacity. Its employees now range in number from seventy-five to one hundred. The factory is three stories high, ninety-one feet front by one hundred and thirty-seven and one-half feet in depth; the lumber store rooms being forty-six feet in front by two hundred and seventy-five feet in depth. They purchase their lumber by cargo. They receive it in pieces varying from six to twelve inches in thickness, and from twelve inches to thirty inches in width. The wood is mostly spruce, but for butter chests, and other articles requiring great strength, they use maple and ash.

The business of this establishment has steadily increased from its origin up to the present time; and they now turn out from twenty-five hundred to thirty-five hundred boxes daily. This immense number is composed of boxes ranging in size from those three inches in diameter, to the largest packing boxes. Their stock is disposed of mostly in San Francisco, portions of it going from here to all parts of the Pacific coast. The San Francisco Packing Co., Cutting & Co., and Lusk & Co., are among their heaviest purchasers. To move their stock they have six horses, which they keep busy throughout the year. Those who are interested in the question

What Shall we do with Our Boys,

Should visit this establishment. They will here find, at different seasons, from twenty-five to thirty-five boys employed in light, healthful labor. Mr. Swan has not hung out the sign "No Chinamen Employed," but he has carried out the principle; and it is really gratifying to the visitor to see these busy, cheerful youngsters, thus employed to the profit of themselves and of the community.

One of the most interesting features in this manufactory is

The Steaming Process,

By which the wood is prepared for cutting. For this purpose large wooden tanks are provided, into which the wood, out the requisite lengths, is placed. The water, into which these blocks of wood are put, is prepared by a chemical process, for which this company possesses a patent. Steam is then forced into the tanks, and after being exposed to this boiling for about thirty-six hours, it is ready for cutting. It is now placed upon the "slicing" machine while steaming hot, and is sliced to any desirable thickness, from one-hundredth part of an inch to one-half inch; this width, in some cases, being eighteen inches. The block being out during our visit was only two feet in length; but a machine is nearly completed which will take a block six feet in length. These large slices are more especially intended for the backs of large mirrors and picture-frames. One of these machines, with the aid of three men, will cut in ten hours, two hundred thousand superficial feet of lumber. The wood is not steamed, but boiled; and the mechanical and chemical appliances combined in this process, have achieved a remarkable success. There are no chips or sawdust, thus avoiding all waste of wood, and the surface is as smooth and clean as the outtings from a new bar of soap. The pliability and toughness produced by Mr. Swan's process are not affected by drying. Among the machines in operation here, is one for cutting up lumber, (their own patent) which will turn out as much work in a given time as twenty men can do by the ordinary process of sawing.

They have a perfect dovetailing machine, the only one of the kind on this coast, used in making butter-chests, tool-chests, office-boxes, and other heavy work. Besides this there is a small machine of the same character for smaller boxes, and still another called the "mitre dovetailing machine," which cuts a groove and tongue which can be placed together with great rapidity, and make a neat and almost inseparable joint. The boxes and chests upon which the above machines are employed can be shipped in parts, thus securing a great saving in transportation, and put together with remarkable ease and rapidity.

The number and variety of articles made here are so great that it will be impossible for us to give scarcely more than a mere enumeration of them; but as we have on several occasions received from our readers, inquiries as to the supply which our market affords in this line, we will mention some of the articles most in demand; attending first, to the wants of the growers and shippers of fruit.

Beginning with the lowest grade, we have the one-pound fruit box, well adapted to "nesting," which can be bought for one dollar per hundred. Strawberry "drawers," which formerly

sold at ten cents, can now be made and furnished at eight cents, for eight pound drawers, and six cents for four pound drawers. There are other boxes for carrying grapes, cherries, etc., made in two pieces from this "sliced," tongued wood; and being "scored" for their corner joints, they can be packed allmost as compactly as sheets of paper and forwarded in this manner. When wanted for use, a mere novice in mechanics can put them in shape, by using half a dozen tacks, as fast as a grocer can put up his pound packages; these can be bought at from three to four cents, holding from five to eight pounds. The peach basket, standard size, strong, light, and neat, good

Vessel for Measuring and Drawing Liquids.

Mr. Joseph H. Corliss, of Reno, Nevada, has recently patented, through the agency connected with this office, an improvement in combined tanks and liquid measures, for measuring and drawing liquids. It consists of a series of stationary measures of different sizes, which are so connected with the containing can or vessel, that by simply moving a lever, either of the measures can be filled; and, after closing the communication with the containing-can, the

CORLISS' COMBINED TANK AND LIQUID MEASURE.

contents can be drawn off by a cock. By referring to the accompanying cut, the construction of the apparatus will be understood.

Packing Business

Are properly considered here. The most noticeable among the articles in this line are the square lard boxes. They are coated inside with a cement which prevents the soaking of lard by the wood, and are covered with a material which renders them impervious to moisture or air. The top is attached and included in this preparation, only a hole being left, through which the melted lard is poured, when a stopper, which comes with the box, closes the strainer; and it is ready for the purchaser; and if the purchaser don't come, why, the lard can wait. The cement applied to the inside of these "lard caddies" is patented by this company, and is used in various other articles made by them, which require to be impervious to moisture, or which might otherwise impart the taste of the wood to delicate articles.

Pickle kegs, cartoons for jellies and other moist articles, boxes intended to take the place of jars for butter, corned-beef, etc., are to be found here. For uses where extra strength is required, they have contrived upright bars, which are attached to the sides of the box, forming a very strong article. This company have made great efforts toward improving and cheapening butter-chests, and have attained both these objects.

Swan & Co. have been highly complimented by box manufacturers, both from New York and Chicago, who have recently visited their works, and they certainly deserve local commendation for perfecting and cheapening much needed articles, and for imparting increasing confidence in the success of our home industries.

QUICKSILVER.—The New York Shipping List recently published an article from the *Call* under this head and appended the following: We know not what State legislation can effect, but some parties in California call for the repeal of the duty, which is 90 per cent. of 15 per cent., or 13 1/2 per cent. net; but this, we fear, would not remedy the evil complained of, the difficulty being in the curtailed supply from Spain, on account of the war there, and the consequent advance in London to a price which will not admit of its importation thence. In this State of affairs there would seem to be no remedy, unless the supply can be increased by a cessation of the war in Spain, or the opening up of new mines in this country. Many reports have been made from time to time of new discoveries and large supplies to be expected, but they would appear to have been made for a purpose, for no increase seems to have been made in the visible supply. At present London quotations it would cost about \$1.35 @ \$1.36 gold laid down from there.

It is stated that miners' outfits for the Sticksen mines can be procured as cheap at Fort Wrangel as at Victoria. One firm advertises that it has 27,000 pounds of goods at Dease Lake, British

will flow; but, as this tube will always fill to the height of the liquid in the tank, and thus add so much to the measure each time, the inventor prefers to employ two tubes, K and L, one of which has its upper end opening just beneath the top of the tank inside, while the other passes up through the top as shown. These two pipes connect with a stop cock, M, having passages, a, b, c, as shown, which serve to connect the measure alternately with the pipe, K or L. This cock, M, is operated from the outside.

The operation will be as follows: The lever, F, being moved so as to open communication from the tank through the passages, H and I, to the measure, the cock m is turned, so that the air in the measure may escape into the upper part of the tank, until the measure is filled. The pipe, K, will also be filled to the level of the liquid in the tank; the cock, m, is then turned so as to open communication with the pipe, L, and when the discharge-cock is opened air from the outside will supply the space left by the discharge of the liquid, while the liquid in the pipe, K, will be retained there by the closing of the passage in that direction.

By constructing the apparatus in this manner the inventor is able to measure exactly and deliver expeditiously, any liquid contained in the can. There is no necessity of any loose measures standing about dusty and dirty; the whole arrangement being very simple, economical and cleanly. The apparatus is especially adapted for measuring coal oil, but can be used for measuring liquids of any kind. Pint, quart, gallon, or any other sized measure, may be placed in the bottom of the tank when it is constructed, according to the use to which it is to be put. In grocery stores and such places small measures would be desirable, which could be filled twice or oftener to suit circumstances. The machine is a practical and very convenient one. Parties desiring further information concerning it, can address the inventor as above.

Self-Pumping Well-Boring Drill.

With the improved drill represented in the annexed illustrations, the inventors claim that not only faster and better work can be accomplished, but that the apparatus can be more conveniently manipulated, and will penetrate further into the ground before its removal for cleaning is required, than the borers in common use. It is also stated that a hole, with this device, may be sunk by hand a distance of 200 feet, and with a lever to any desired depth; while the operator is enabled, during the progress of the boring, to know exactly the kind and depth of strata through which the tool is passing.

The drill is made tubular and somewhat flaring, so that it forms an orifice a little larger than its body. Its lower edge is serrated, so as to cut a ring groove into the strata, the core of the bore passing up through the cavity in the drill. The upper end of the latter is rabbeted, and, by means of a screw thread cut thereon, is attached to a perforated tube, A, Figs. 1 and 2. The object of the holes in the tube is to allow the water to escape, and thus lessen the weight of the drill as it is moved up and down. To the upper end of the drill is hinged a valve, B, represented in section, Fig. 2, which opens upwards into tube A, so as, when the tool is raised, to carry the contents of the pipe up with it. Sections of tubing—part of one of which is shown at C, Fig. 1—are screwed to the part B, and increase in number with the depth of bore.

When the sectional pipes are too heavy for manipulating, a rope may be attached by means of a swivel to the end of sectional pipe, and the boring may be continued to indefinite depth. In prospecting for coal oil or mineral deposits, as has been stated above, the operator can ascertain the exact nature of strata which he is boring through, simply by means of the pump attached to the drill. The drill cuts a solid core, and when it is taken out so as to clean the pump, the core which the drill has cut, may be removed, and can be examined at pleasure.

In the Pacific States and Territories, where prospecting is carried on and water is needed, the drill would be a useful instrument. Another advantage claimed is that, should the portions of the device become detached, a screw rod may be readily inserted and the separated parts drawn out.

This device was patented by Messrs. Timothy Phillips and Joseph Goletz. Territorial rights and further particulars may be obtained by addressing the inventors at Leavenworth, Leavenworth county, Kansas.

BELL RINGER.—Referring to an article recently published in this journal concerning "Locomotive Bell Ringers," a correspondent writes us that on the Detroit and Milwaukee railroad, in Michigan, nearly, if not all, their engines are supplied with a separate bell situated in front of the boilers, on the platform immediately over the pilot. The bell is so arranged that every revolution of the truck wheels produces a blow. It can be thrown out of adjustment when desired.

The opening of the new mining districts in San Bernardino county will necessitate the shipment of large quantities of ore through Los Angeles, and the

soldered, or otherwise secured to the bottom of the containing-vessel, around its periphery and facets, C, serve to discharge their contents when desired. Through the top of the vessel, A, a stem, D, passes down to the bottom in the center, and this stem operates the plug, E, of the cock, G, being turned from side to side by a lever or handle, F, upon the top of the tank, A. The cock, G, has as many passages as there may be measures; in the manner of a one, two or three way cock. H is the inlet passage from the tank; and I is the outlet passages connecting with the cock, G, and the measures, BB. A single tube, J, may open into the top of the measure and lead upward through the tank in order to supply air to the measure, and a hole supplies air to the tank so that the liquid

Self-Pumping Well-Boring Drill.

How to Get to San Juan.

The Colorado Springs *Gazette* sensibly advises people not to start for San Juan too soon, and also gives some figures as to distance, etc., which will be interesting to our readers:

It is not yet time to start for San Juan; it will be some weeks before the roads to the mines are open, and people who go now to Loma or Del Norte are likely to have considerable waste time on their hands. For the service of those, however, who propose to set out before long for the new El Dorado, we subjoin some detailed information as to the best route to take. It has been furnished to us by a gentleman who is thoroughly acquainted with the San Juan country and with the routes thither, and confirms the opinion which has been generally expressed by all who have practical knowledge of the matter—that Colorado Springs is decidedly the best outfitting and starting point, and the road via the Ute Pass decidedly the most advantageous, when all the essentials—distances, quality of road, abundance of grass and water, etc.—are taken into consideration.

From Denver, take the Narrow-Gauge Railway to Colorado Springs, where everything, in this line of "outfit," can be procured as reasonably as at any other point in the Territory. Then by teams through the Ute Pass into South Park, across the park to the Salt Works, leaving Fairplay twenty miles to the right, and on to Chubb's, at the head of Trout creek. Then down Trout creek, (rightly named), to the Arkansas, where there is a good, free bridge. Crossing the river, you go down the valley for a dozen miles or more, and then, bearing to the right, cross Chalk creek, Brown's creek and several other fine mountain streams, striking the South Arkansas near the Punched creek. Here is the post-office and Punched Pass Toll Gate. From this point it is nine miles to the summit of the Pass, and the road is good. At the top you enter the famous San Luis Park, and soon reach the head of San Luis creek. Following this stream for several miles, you finally leave it to the left and cross Alder and Kirber creeks. Passing the Hot Springs and Hunt's Springs, the next halt is at Saguache. From Saguache the route crosses the Carnero and La Garita—considerable mountain streams—and may either go via Del Norte and the Rio Grande Valley, or via Conejos, Tierra Amarilla and Elbert, the new town in the Lower Animas valley. The distance is about eighty-five miles greater by the latter route, but the road is much more practicable and is open, to the mines at least a month earlier than by the former or Rio Grande route.

By this route, via Ute and Punched Passes, Conejos, Tierra Amarilla and Elbert, the scenery is interesting, grass and timber abundant, water is plentiful and of the best quality; and, if desired, good stopping-places occur at convenient distances for the greater part of the route.

The distance and points are as follows: Colorado Springs to Castello's, 33 miles; Castello's to Pulver's, 15 miles; Pulver's to Sulphur Springs, 7 miles; Sulphur Springs to Hartzell's, 6 miles; Hartzell's to Salt Works, 14 miles; Salt Works to Chubb's, 6 miles; Chubb's to Chalk creek, 15 miles; Chalk creek to McPherson's (toll gate), 18 miles; McPherson's to Summit of Punched Pass, 9 miles; Punched Pass to Jack Hall's, (Kirber Creek), 15 miles; Jack Hall's to Hot Springs, 7 miles; Hot Springs to Hunt's Springs, 10 miles; Hunt's Springs to Saguache, 3 miles; Saguache to Carnero, 18 miles; Carnero to La Garita, 2 miles; La Garita to Del Norte, 12 miles, or La Garita to Conejos, 40 miles; Conejos to Tierra Amarilla, 47 miles; Tierra Amarilla to Pagosa Hot Springs, 53 miles; Pagosa Hot Springs to Elbert, 50 miles; Elbert to Baker's Park, 30 miles; Elbert to La Platte mines, 18 miles; Elbert to San Miguel, 27 miles; Colorado Springs to Baker's Park, 416 miles.

By the Rio Grande route, the points and distances are the same to La Garita. La Garita to Del Norte, 12 miles; Del Norte to Wagon Wheel Gap, 30 miles; Wagon Wheel Gap to Antelope Springs, 22 miles; Antelope Springs to Antelope Park, (Franklin's), 8 miles; Franklin's to Beaver Meadows, 17 miles; Beaver Meadows to Lost Trail Creek, 8 miles; Lost Trail Creek to Pole Creek, 12 miles; Pole Creek to Cunningham Pass, 6 miles; Cunningham Pass to Baker's Park, 6 miles; Cunningham Pass to foot of Baker's Park, 12 miles; Colorado Springs to foot of Baker's Park, 329 miles.

This route is not practicable until June, nor is it ever an easy one. A toll-road has been constructed most of the way to Antelope Park, but the remainder of the route is tortuous and rugged in the extreme.

A wagon-road will be completed as early as practicable in the coming season, between Elbert and Baker's Park; and it is expected that this road can easily be kept open for travel all seasons.

A winter road via the Rio Grande route is an impossibility.

Another route can be taken by those who prefer it. It is shorter than the one already given via South Park, Conejos, etc.

Outfitting as before; it is from Colorado Springs to Pueblo, 45 miles; Pueblo to the Greenhorn, 30 miles; Greenhorn to the Huertano, 14 miles; Huertano (via Sangre de Cristo Pass), 24 miles; Huertano, (via Abeto Pass) to Sterne's, 27 miles; Sterne's to Wood's (Ute

Creek), 18 miles; Sterne's to Ft. Garland, 20 miles; Ft. Garland to Conejos, 35 miles; Conejos to Baker's Park, as before, 180 miles; Colorado Springs to Baker's Park, 336 miles.

By this route the distance is shortened about fifty miles, but the road is much less desirable, particularly in crossing the San Luis Park, where it is dry and sandy enough; and the essentials of grass, wood and water, are less abundant—in fact, over a portion of the route, entirely out of the question.

WOOD AND LUMBER COMPANY.—The Nevada Transcript says: Mention has frequently been made of an enterprise about to be begun by parties of this city, the object of which is to convey lumber and wood from the sections too remote from the towns to pay for hauling it with teams. J. E. Brown, of this city, and Harvey Cooper of Blue Tent, are the originators of the enterprise, and Mr. Brown furnishes us with the following particulars: They propose erecting a saw mill at the head of Casado Ditch, having the capacity to saw 15,000 feet of lumber per day. The mill will be run by water power. They will have a pressure of 325 feet, and will use it to propel a hurdy-gurdy wheel of large size. The water, after its passage from the wheel, will be utilized in conveying the lumber sawn at the mill—wood, etc.—to the towns of Nevada and Grass Valley in a V flume. The sides of the flume will have a capacity of running 15,000 feet of lumber or 200 cords of wood per day. It will have a grade of one inch to the rod. The flume will be fourteen miles long. The mill will be located in an extensive timber region, and at a point where it can not be reached in any other way. The company will be incorporated soon, and work will be commenced as soon as the weather will permit. The enterprise is one of importance, and will be remunerative to the projectors, besides being of great advantage to the towns and mines of Grass Valley and this city. Wood can not be had here now for love or money. There is no dry wood for sale in town. After this company get in operation, things will be different. The supply will equal the demand.

NEW BOX-MAKING MACHINE.—A novel and most ingenious machine was exhibited in operation at the recent monthly meeting of the Franklin Institute, viz: Heyl's machine for making paper boxes. This invention performs, with marvellous celerity, all the movements of the human operator, and turns out boxes of any desired sizes ready for use. The inventor at first designed a neat machine for pasting the different parts of a box together, as is now done by hand labor; but, by this machine, he has superseded his former invention, by one in which the parts of the box are held together by a wire, which, at the proper time, is made to puncture the card, and is instantly locked down upon it. The machine is capable of turning out from 60 to 100 boxes per minute, according to the size of the box. The machines, though but recently brought to public notice, are already kept busily at work filling orders, and there can be little doubt that they will bring about a speedy revolution in the box trade.

SOLIDIFICATION OF NITROUS OXIDE.—According to Wille, nitrous oxide may be easily solidified by causing a rapid current of air to pass through the liquefied gas. Different in this respect from carbonic acid, nitrous oxide may be kept liquid for some time in open vessels. Carbonic acid solidifies, as soon as it escapes from its containing reservoir, because the tension of the vapor of the solidified acid, even at the moment of its formation, is considerably superior to atmospheric pressure; while liquid nitrous oxide attains—133° Fah. and solidifies at—146°, so that the tension of its vapor is weaker than one atmosphere. The density of the liquid protoxide at 32° Fah. is equal to 0.9004; its coefficient of dilatation is very considerable. It is insoluble in water.

NEW PHOTO-PROCESS.—A recent improvement, announced by Mr. Burgess, a photographic artist, of Peckham, England, consists in sensitizing gelatin by means of bromide of silver. The mixture is applied warm to the glass plate, and the picture may be taken with the plate either wet or dry. The time of exposure is the same as for the ordinary wet collodion plates. The alkaline-pyro developer is used, the picture making its appearance rapidly, with any required degree of intensity. The new process promises to compete ably with the ordinary collodion process.

WHEN BEETS ARE PRESERVED FOR THE MANUFACTURE OF SUGAR, they give off carbonic acid and take up oxygen. The carbonic acid is a product of the oxidation of the sugar contained in the beets. According to calculation, 1,000 cwt. beets would lose 10 cwt. sugar in thirty days. The air contained in the beets consists mainly of nitrogen and carbonic acid and very little oxygen.

SPONTANEOUS COMBUSTION OF HAY.—In a paper on the spontaneous combustion of hay, H. Ranke says that, in consequence of prolonged fermentation, hay can be transformed into a true coal, which, when exposed to the air at somewhat elevated temperatures, acts as a pyrophorus. *Quart. Jour. Sci.*

THE RATE OF WAVE-MOTION was shown by Aebe to be only 3 feet per second in the muscles of a frog, much slower than the rate at which waves pass along the motor nerves of the same animal, which Helmholtz determined at 88 feet per second.

JOSEPHINE MINING COMPANY.—The Balmont Courier says: This location is immediately south of the El Dorado South mine, and, in our opinion, will, eventually, when developed, become valuable property. The owners are said to be men of wealth and nerve, and through their Superintendent, Jas. Stewart, work is being energetically pushed forward. A shaft, 4½ x 9, is being sunk, which has attained a depth of 57 feet, having passed through slate and other easily-worked ground, with the exception of the last five feet, which is in rock, similar in character to the surface rock of the El Dorado. The rock blasts easily so far, with no signs of water, and in all probability, none will be encountered, to speak of, in the shaft, the El Dorado company pumping water from their lower levels constantly. The shaft will be bent down about 250 feet, from which a drift will be run for the ledge. At this juncture, it will equal in depth the 490-foot level in the El Dorado South, in consequence of the surface being so much lower. There is a reasonable probability that a valuable mine will be developed in the Josephine property, at a comparatively light cost, within the next three months.

FROM PANCAKE.—Colonel A. Lewis, of the Pancake coal company, arrived from the mine last evening, bringing with him some splendid specimens of coal. The incline has reached the depth of 120 feet, and the work will be rapidly pushed forward until the water line is reached, about 110 feet from the present depth of the shaft, which is being sunk at an angle of 28°. The ledge is at present four and one-half feet in width, and coal of a fine quality is being taken out and used by the blacksmiths and machinists of that locality, who say it is of as good a quality as that furnished them from San Francisco. The hoisting-works are about completed, and nearly all the machinery requisite to work the mine has arrived and is being put in place; the friction-wheels, and a pump capable of discharging 10,000 gallons per hour, are now on the way, having left San Francisco several days ago. Ten men are engaged in working the mine, and as soon as the machinery is placed in working order the force will be increased. *—Eureka Sentinel.*

BORAX.—A late issue of the Borax Miner says: During the last two weeks past, something near 100,000 pounds of borax has been shipped from Blanco Vale, (Teel's marsh), and from the Pacific Borax Works, (Columbine Marsh). The several marshes which are producing borax at present, bid fair to yield a fair amount this season; but may not fully meet the expectation of borax claimants and stockholders. One thing will conduce to the permanent success of a few. Many have found their claims worthless, and will, undoubtedly, abandon them altogether. As Messrs. Rhodes and Watson's marsh is on the Wadsworth road, and we have no report from it, we can not give the amount of borax they send off. Their works have been running for some time past, yielding well for the quantity worked, and a fine quality of concentrated borax.

AUSTRALIAN GOLD YIELD.—The gold obtained during the last quarter was 291,861 oz., 7 dwt., of which 127,036 oz., 9 dwt., was alluvial gold, and 164,774 oz., 18 dwt., gold obtained from quartz. The total amount of Victorian gold exported during the quarter, according to the Customs returns, was 204,787 oz. There was received at the Melbourne Royal Mint during the quarter, 63,384.78 oz. of gold, of which 45,926.21 oz. was Victorian gold. The number of miners at work in the colony during the quarter was estimated at 51,874, of whom 21,355 Europeans and 13,810 Chinese were engaged in alluvial mining, and 16,608 Europeans and 103 Chinese in quartz mining.

IRON IN MONTANA.—There is enough iron ore of the best quality out-cropping in Montana, and lying upon the surface, to make the rail of the Northern Pacific from end to end; and yet it is so worthless that no man will waste time to become its owner. So says United States Marshal Wheeler, and so say the records of the Land-office. These valuable veins and deposits are neither located nor taken up, which is not to be wondered at. Gold, silver, copper, lead loaded with silver, and float-iron and cinnabar are so plentiful as to keep the entire stock of labor in a chronic fever.

SOME long time ago, £18,000 was spent on a claim at Blackwood, known as the Clunes and Blackwood Company. The whole of this money was squandered on the surface. The mine was not prospected. Recently, six men without any capital, have worked the same ground, and discovered a valuable reef. The first crushing has yielded 109 oz. 6 dwt. from 108 tons.

It has been suggested that a cause of certain mysterious fires in factories may possibly be traced to the electric spark, the electricity being generated by the friction of the leather belting on the pulleys.

ONE of the salts most sensitive to heat is the double iodide of silver and mercury. Its natural color is yellow, but it turns red if warmed, and returns to yellow again on cooling.

THE combination of one pound of coal in one minute is productive of a force equal to the work of three hundred horses during the same time.

THERE is probably nothing better and cleaner than black lead and tallow as a lubricant for friction wheels or brakes.

The Stickeen Mines.

The West Coast Star, of March 14th, publishes the following extract from a letter written by a miner in the new gold diggings which will give some idea of their richness: After some prospecting, myself and partners located a good claim on Dease creek. The top gravel, which we worked with a rocker, prospected \$20 a day. There was a great deal of exposed rock and water holes, also cañons and narrow places. It is very rough, and difficulty will be experienced in working the bed, on account of high water. On Thibart creek twelve men worked eight weeks with sluices, and made from one to two ounces a day to the man. This creek is from three to twelve feet deep, and is not quite as rough as Dease creek. The pay dirt here is found on the bed-rock. Dease creek was struck on the 6th of September, and a party of twelve, with rockers, during a period of three weeks, averaged from \$15 to \$40 a day to the hand. Along this creek the pay dirt is found in the top gravel and on the bed-rock, and averages from one to four feet deep. Of the two, I think Dease creek is the richest, and will prove richer than it has so far indicated. Another letter published in the Owyhee Avalanche, written from Victoria, B.C., under date of Feb. 25th, by J. R. Lee, to Frank Belrose, of Fairview, gives the following details: I left San Francisco on the 5th inst. and had a very quick trip to this place, being a little over three days—distance, 800 miles; price of passages, cabin, \$30; and steerage, \$15. There is only one boat running from Frisco to Victoria, but there are three boats running from here to Fort Wrangle at the mouth of Stickeen river, which is 300 miles from Victoria—fare \$30; cabin, and \$20, steerage. From Fort Wrangle up the Stickeen river to Buck's Bar, it is called 160 miles; from Buck's Bar across the country to the mines it is 80, and some say, 100 miles. There are no provisions nor supplies at the mines yet, nor will there be till after the river opens. It will be the middle or last of May before boats can run up the river to Buck's Bar. As near as I can find out, there are 500 or 600 men already in there, and on the way. The only supplies they can get are what they take with them on hand-loads. What I have stated in relation to distances is upon information gleaned from three of the discoverers, whom I saw here. Two of them went up to Fort Wrangle on a boat that left here three days ago; the other says he will not go till the river opens. I questioned them about the mines, but could not get much satisfaction. They told me, however, that they found gold on two creeks and had made good wages during the time they worked. They don't know whether there is any extent to it or not, but they got a splendid quality of heavy gold. They told me the creeks are large, and plenty of timber throughout the country, but they do not encourage any one going there till the river is open. I shall remain here until the middle of April, as I am not good on a hand-sled, and the chances are I would have but little grub left when I got to the mines. I will write you again when I reach the mines and see what there is.

LONGEVITY OF MEDICAL MEN.—According to Dr. Casper, of Berlin, who has written an interesting work on the duration of human life, the average age of clergymen is 65; of merchants, 62; of clerks and farmers, 61; military men, 59; lawyers, 58; artists, 57; and medical men, 56. The medium duration of life in Russia, he states at about 21 years; in Prussia, 29; in Switzerland, 34; in France, 35; in Belgium, 36; and in England, 38 years. Another writer, of great experience, proves that, under ordinary circumstances, man can live six or seven times longer than the years required to attain puberty. This epoch is placed at our fourteenth year. This calculation would therefore yield from 84 to 98 years of age. It is our own fault, and not Nature's, if this period is abridged. The London Medical Times and Gazette give some statistics showing that medical men in England stand high on the scale of longevity. The united age of twenty-eight physicians who died last year amount to 2,354 years, giving an average of more than 84 years to each. The youngest of the number was 80, the oldest 93; two others were 92 and 89 respectively; three were 87, and four were 86 each; Sir Henry Holland being one of the latter. There were also more than 50 whose average age was between 74 and 75 years.

EFFECT OF RARIFIED AIR.—A recent book of travels in Asia, by Dr. Henderson, contains an interesting statement of his experience on high altitudes. A few days' out from L6 they had to cross a pass, the Chang-la, 18,000 feet high. In so doing, almost every one suffered from the rarity of the atmosphere; in one case the pulse went up to 100, the respirations to twenty-two per minute. Some complained of a feeling of suffocation, and could not sleep; but a few deep inspirations relieved this feeling. Intense headache was complained of, with great prostration of mind and body; the temper became irritable, and there was most distressing nausea. In some, the lips became blue, and in another case the temperature, as indicated by the thermometer, sank one or two degrees. Such is the exceedingly interesting account given of the effects of great rarification of the atmosphere by Dr. Henderson. We may mention that here the barometer stood at 15.73, and the thermometer at 61° Fahrenheit, and water boiled at 181° Fahrenheit.

Antimony.

The popular idea of antimony is somewhat vague and indefinite. Some, who know about antimonial wine, suppose it to be a rare drug, and somehow connect it with, or mistake it for, antimony. Others, of a notarial turn of mind, imagine antimony to be a legacy of an aunt, on the analogy of patrimony being the hereditary estate of a father, while that of a mother is matrimony, of course. Only the few whose business it is to know, are aware that antimony is a metal, looking like lead at first sight. In its qualities, it is very different from most common metals, especially in being brittle. It is brought into commerce in square cakes or truncated pyramids, some four inches thick. Strike one of these with a sledge, and it breaks easily into several pieces. Put one of these in a mortar, and it can be pulverized. The fracture shows large, laminated crystals, very bright, and of a tin-white color; and the metal has so great a tendency to crystalline structure that its smooth surface, on cooling, is covered with a beautiful figure, like a star of broad leaves, and resembling jappanned tinware. The appearance of this star is commonly considered a sign of the purity of the antimony, but erroneously; for, producing it on the surface is a mere trick of trade, as will be seen below, and it can be shown on antimony containing so much as five per cent. of impurities, while the chemically pure metal will have no star, unless cooled under certain precautions. Antimony is not so heavy as lead, its specific gravity being 6.7, or nearly the same as that of cast iron. On heating it in the air, it melts at 551° F., and becomes coated with a white oxide, which, on cooling, crystallizes in brilliant transparent needles. It is volatile, but can not be distilled so long as oxygen is present, because the metallic vapor is instantly oxidized, and the oxide is not volatile. But in an atmosphere, or current of hydrogen, or any hydrocarbon gas, antimony distills very easily at a temperature below red heat. A small globule of antimony, melted on a piece of charcoal before the blow-pipe and suddenly thrown down, dies to pieces with brilliant scintillation, and the fragments, as they roll off, leave a track of white oxide—a neat prior experiment, but not to be made on parlor furniture. Chemically, antimony plays the part of a metalloid rather than a metal, forming with oxygen an oxide and an acid, and giving corresponding combinations with sulphur, chlorine, etc.; but its oxide forms no salts with acids, as most metals do.

Antimony is one of the "base" metals. In value it stands between copper and lead, being commonly worth about half as much as the former, and twice as much as lead. But the price is very variable, ranging from ten cents per pound (gold) to sixteen cents; its average market value may be stated at twelve and one-half cents per pound. The metal, in its pure state, is too brittle to be used for the manufacture of any sort of utensil; but it is extremely useful as a constituent of several important alloys, to which it imparts hardness. If printers' types were made of pure lead, they would be so soft that a few impressions would mash the delicate characters out of shape; but the addition of about twenty per cent. of antimony to the lead, gives an alloy hard enough to stand many thousands of impressions before becoming quite worn out. No other substance would answer so well as this alloy of lead and antimony for type metal; and this alloy alone gives antimony an important position as an essential material in the useful arts. The valuable anti-friction quality is imparted to Babbitt metal by antimony, and this alloy is very extensively used for bearings, especially in steam engines and in the boxes supporting the axles of railroad cars. Several other well-known alloys contain antimony.

The quantity of antimony used medicinally is trifling; in the shape of tartarite of antimony and potassa, it forms tartar emetic, a solution of which in sherry and maderia, is the familiar antimonial wine. Oxide of antimony has been proposed as a white paint, being of good body, and not subject to discoloration, but the efforts to introduce it (in France) have not met with favor, because it is not in all respects superior to either white lead or zinc white, while it is more expensive than either, from the greater value of the metal. The native sulphuret of antimony purified by lixiviation, is used as a medicinal remedy, especially in the veterinary department; another artificial sulphuret containing an oxide, was formerly considered a great specific, known as *mineral kermes*; and still another combination with sulphuret, called *golden sulphuret*, occurs in the pharmacopoeias. Chloride of antimony is used to a small extent for browning gun-barrels. The total consumption of antimony in the United States is not much over 1,000 tons per annum, and by far the greater part of this is used for type metal and Babbitt metal. The various type foundries in the West, at St. Louis, Chicago, Cincinnati and Pittsburgh, consume in all about 120 tons; New York, Boston, Philadelphia, and Baltimore use about 180 tons in this way; so that about 300 tons are used annually for type metal, and nearly all the rest for Babbitt metal.

No antimony having as yet been made in quantity on this continent, the importations ought to show the consumption. But such is not the case, because the type foundries, in place of buying metallic antimony, use very largely an alloy, called hard lead, obtained in smelting lead from antimonial ores, and quite available for type metal, if free from zinc. It is

cheaper in this form, and therefore a great deal is used without appearing on commercial returns, because it is classed as lead. Yet, hard lead often contains 30 per cent. of antimony. —*Jour. Appl. Chem.*

San Bernardino County.

San Bernardino is cut off from the sea by a small intervening slip of Los Angeles county; population, 9,000. The San Bernardino range of mountains divides the county into two parts, differing from each other in topography, climate and nature of soil. The eastern part lies within the Great Basin, or valley of the Colorado, and may be said to be worthless, agriculturally. The western part extends from the San Bernardino range to the Los Angeles line, including within its boundaries the beautiful, fertile valley of San Bernardino. The western slope of the county contains an area of about 2,000 square miles, nearly all of which is highly fertile. The San Bernardino is divided from the San Gabriel range by the Cajon pass, and from the San Geronimo pass. Each of the passes opens on the desert. East of the San Bernardino range the vast area of country extending to the Colorado is a barren waste, a great part uninhabited, and almost uninhabitable. The landscape is diversified, indeed, presenting the most varied scenic contrasts. In the country are great mountains, vast forests, extensive table-lands, beautiful and fertile valleys, teeming with semi-tropical productions, dreary alkali flats, sparkling streams, or, rather, small rivers, spreading beauty and fertility in their flowing paths, and a vast and sterile desert. The bleak, bare and waterless desert is offset by the most fertile, blooming and beautiful valley in California; the frigid vegetable and the orange-tree grow side by side. The productions of both the semi-tropical and temperate regions of the earth are indigenous to this soil; the precious as well as the useful metals abound throughout the vast mountain-amphitheater, which almost encloses our famed valley; and, to carry the parallel still further, we have two distinct climates; for, during the winter season in this valley, summer and sunshine reign on and along the edge of the desert. It is a country abounding in most surprising natural contrasts. —*San Bernardino Guardian.*

AUBURN MILL COMPANY.—The Reno Journal says: The Auburn Mill company have made arrangements to secure a regular supply of high grade ores from the Dayton Gold Silver mining company, Silver City, and from a series of mines at Terrace, Utah, owned by Thos. H. M. Winn & Company. Being so far removed from its source of supply this mill has heretofore labored under many disadvantages, but from present indications their liberal terms offered to mine-owners have secured for them the prospects of a most successful business during the season.

WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere.

[By Our Regular Correspondent.]

The Weather.

Since I wrote on the 1st instant, has been fearfully and terribly severe. March made its entrance like the roaring monarch of the forest, to whom it has been likened, and has, since then, given us a fair sample of its meteorological changes, which, however, have been from bad to worse.

That venerated and reliable personage, so well known in every quarter, "the oldest inhabitant," has no recollection, whatever, of having ever before witnessed so wild and stormy a winter in this section, as the one now so happily drawing to *finis*.

The first snow of the season fell here on the 16th day of last October. It has clung to us with loving fondness ever since, and seems bent upon remaining with us many weeks yet, too, as a lingering, crowning glory to our proud old hills. The genial, vivifying rays of the summer sun—if such should ever again gladden us—will, however, soon dissipate this last vestige of the cause of all our woes and inactivity, for so long a time. Soon, too, our hills will be once more teeming with life and vigor, with our hardy sons of toil working like leavers amid their fastnesses, to "make hay while the sun shines," or, in other words, to make up for their long, idle spell. There has been very little done in the way of mining since the first of last December. That month we thought bad; January, we noted infinitely worse, and February, with its 28 days, left its record behind it of being the most superlatively inclement month of the three; but March, thus far, has thrown the whole three in the shade, altogether. Our only consolation now, however, is that, when having spent its fury, as it soon must, it will illustrate the gentler side of the animal kingdom in its exit. It is, at present writing, cold and stormy, with the incessantly descending snow blinding us at every turn, and with the icy ground rendering pedestrianism anything but a profitable or agreeable exercise. The snow is piled up in huge banks and drifts in every quarter; and its depth can only be conjectured. We can, however, without any attempt at exaggeration, place its depth at any degree from 0 to 60 inches, and in many places it is even deeper. The approaches to our leading mines are also hopelessly blocked up, and will be so for many weeks yet, without the winter's accumulations are shoveled off. Should the sun, however, come out strong and warm for a few days, it would do much towards removing its obstructions. The thaw, when it does come, as come it must, and that soon, too, will bring with it a miniature deluge, the like of which has not visited this region very probably since old Father Noah's ark sailed in triumph above its submerged mountains. The aboriginals, in anticipation of the threatened avalanche of waters, have been unusually busy moving their worldly goods and household gods to safer and milder quarters, amidst their ancestral hills, somewhere to the south. Well, "if ignorance is bliss, 'tis folly to be wise." So thought the accomplished Mr. Wilkins Micawber, when in that happy condition hovering between the extremes of doubt and hope, "waiting for something to turn up," as many of our citizens here are, after the winter shall have disappeared. Now, let us turn from snow and ice to have a word to say about our mining interests, since they are the most important interests, for upon their prosperity depends everything and everybody here.

The Richmond

Has been working light-handed for some time, owing to the weather, which precluded the possibility of ore or coal hauling to its furnaces, which have been standing idle; but not, however, for the want of ore, but from a lack of carbon to reduce it with. Ore is abundant in the mine and at the furnaces, but there has not been a bushel of coal received for many weeks. It is impossible to haul it in over the bad roads, and till there is some change for the better there will be none hauled.

The Eureka Consolidated

Has also been working short handed owing to a like cause. This company has, however, been so fortunate as to have had coal enough on hand to keep one out of its five furnaces in full blast during the whole winter. This is the only furnace in the camp that is running or likely to be before May, but it is possible that coal enough may be received by the middle of April to set them all in motion. It is, however, doubtful. The accounts from this mine are good. The bottom developments lately made, are, said, by those who know, to be of a very encouraging character. The ore is rich and abundant, giving promise of a bright future to stockholders, and others interested in its welfare. Dividends will, it is thought, be disbursed monthly during the coming summer. They should be, because the mine appears to be in a condition to do so.

The K. K.

Being the next in importance, has been also partially idle. It is, however, like the others, working but a few men. The mine is reported to be in excellent condition, with an abundance of fine ore. This company paid, for many months,

last summer, a dividend of 25 cents per share, aggregating \$12,500 per month. I have no doubt but a resumption will be in order at an early day. There have been a complete outfit of new and powerful hoisting engines, boilers, etc., erected at a heavy outlay over the works of this company within the past few months. Their furnaces are of course also idle, no coal being a prevailing complaint.

The Ruby Consolidated

Is working only 20 men. The mine is looking well, and will turn out a large amount of ore during the coming season. Many new developments are reported to have been made during the past few months. This company was incorporated in London some two years ago, and is at present managed by Herman Hyemmann, merchant of San Francisco, and superintended by John H. Plater of this burg. Its future is most promising.

The Orange Company's

Works are also being now pushed vigorously ahead. The prospects of this company are most flattering, as the future will, I have no doubt, demonstrate. The next in importance is the

Hoosac Company,

Whose mine is distant about five miles south of town. They have worked a few men all winter, but with what results is not said. This reference is no doubt owing to the late trial, a decision of which has not been yet rendered; but will be at the April term of Court. I append the main features of this interesting suit, as developed at the trial, during the latter portion of last month. It was very ably conducted on both sides. The plaintiffs were represented by Messrs. Ellis & King, of Carson City, assisted by Messrs. Hupp & Hillhouse, of this place; while the defendants were represented by Messrs. Wren & Bayley, of Enreka, and Judge Garber, late of the Nevada Supreme Court; but now, I believe, of San Francisco. The case, necessarily abridged, will be found well worth the perusal; and is, in every essential, as developed at the hearing in Court.

Cole & Bridge vs. Strout et al.

Cole & Bridge and Strout & Wernmouth were co-owners in the Hoosac mine, in the early part of 1872, Messrs. C. & B. owning together one-third interest, and S. & W. owning and controlling a two-thirds. Up to that time very little work had been done on the mine. Cole & Bridge did not think much of the prospect, and refused to do any work or pay any assessment towards development. Strout & Wernmouth commenced prospecting and working the mine on the 13th of June, 1872, and formed an association for the purpose of enabling them to make the other parties pay their share of the expense. This was done on the 24th of July, 1872, under the statute of 1865.

Meanwhile, Cole & Bridge, on the 19th of June, 1872, bonded their interests in said mine to one Sayers, for \$1,500; said amount to be paid at the expiration of six months, and they (Cole & Bridge) to convey the legal title to their interest upon receipt thereof; and said Sayers to pay any assessments that might be levied upon their interest during that period. This bond amounted to an actual sale of C. & B.'s interest, with an agreement to carry the legal title upon the fulfillment of the conditions thereof. The fact of this bond having been executed, was kept secret by Sayers and Cole & Bridge, and nothing was said to or known by Messrs. Strout & Wernmouth about it, until about the first of September, 1872. A few days previous to this time, Messrs. S. & W. had struck some good ore in the mine, in the upper shaft, said shaft being about seven feet deep, and having also taken out therefrom about ten tons of ore assaying \$180 per ton. While this ore was at the Richmond furnace for reduction, Mr. Sayers sought Mr. Strout and informed him, for the first time, that he had a bond for Cole & Bridge's interest, and demanded one-third of the proceeds of the ore. The mine was at this time indebted to Messrs. Strout & Wernmouth some \$300 for moneys expended by them in its development. Subsequently, Mr. Sayers finally sold and assigned his interest in the bond to Strout for the sum of \$250. This was on the 4th of September in the aforesaid year. On the 8th of the same month, Messrs. S. & W. struck a body of ore in the lower level of the mine. Sayers, upon learning this, naturally felt very sorry at having sold his interest to the bond, and as it appears, commenced devising a scheme which he thought would enable him to annul his sale and receive the benefit of the new strike in the mine. He (Sayers) then went to Messrs. C. & B. and told them not to convey a legal title when the bond should become due and its conditions be complied with.

On the 10th of December, 1872, Strout made a tender of the amount stipulated in the bond (\$1,500) to Cole & Bridge, and demanded a deed, according to the terms of said bond, all of which they refused to do; whereupon Strout commenced suit to compel a conveyance, to which Cole & Bridge, by their attorney, J. J. May, set up for answer, that they had conveyed their interest to one George Ware, of California, receiving therefor a valuable consideration. This answer was served on Strout's attorney, but he (Strout) knew nothing of the conveyance to Ware until early in February, 1873. Then J. J. May offered, through a Mr. George Bibbins, to perfect Strout's title to the Cole & Bridge interest in the property, offering a deed from said George Ware to Strout, whom they told that it had been prepared with a view to a compromise with him, and to be delivered to him whenever it should be ef-

fected. This deed, Strout purchased for \$650, and caused a search of the records to be made, which revealed the legal title standing in Geo. Ware; and holding the equitable title by virtue of his bond—he caused his suit against Cole & Bridge, to compel a conveyance of the legal title to him; to be dismissed.

On this, Messrs. Cole & Bridge, through their attorneys, Ellis & King, commenced suit, as noticed above, to have the deed from Ware declared void, because, on the evidence of May, it was filled in blank; that is, as to grantee and consideration. Strout swore at the trial that the deed was perfect when first shown to him, and that he knew nothing, whatever, about its being in blank, until he heard the evidence of May. The deed was also perfect in every particular, when it was exhibited to Geo. Bibbins, at the time the purchase was made. The deed was introduced in evidence, and looked to all intents and purposes perfect, and appeared to be written with the same pen and ink, by the same hand, and at the same time, too. These are matters of very serious import, and will, I have no doubt, receive the consideration they merit, when the verdict comes to be placed upon record, at the next term of court.

Eureka, Nevada, March 16, 1874.

1840. 1874.

PAIN-KILLER,

THE GREAT

FAMILY MEDICINE OF THE AGE.

TAKEN INTERNALLY, IT CURES

Dysentery, Cholera, Diarrhea, Cramp and Pain in the Stomach, Bowel Complaints, Painters' Colic, Liver Complaint, Dyspepsia, Indigestion, Sore Throat, Sudden Colds, Coughs, &c., &c.

Used Externally, it Cures

Boils, Felons, Cuts, Bruises, Burns, Scalds, Old Sores, Sprains, Toothache, Pain in the Face, Neuralgia, Rheumatism, Frosted Feet, &c., &c.

PAIN-KILLER

After a thorough trial by innumerable living witnesses, has proved itself THE MEDICINE OF THE AGE. It is an internal and external remedy. One positive proof of its efficacy is that its sales have constantly increased and wholly upon its own merits. The effect of the

Pain-Killer

Upon the patient when taken internally, in case of Cold, Cough, Bowel Complaint, Cholera, Dysentery and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores, Sprains, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony as an infallible remedy; that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

The Pain-Killer

Derives much of its popularity from the simplicity attending its use, which gives it a peculiar value in a family. The various diseases which may be reached by it, and in their incipient stages eradicated, are among those which are peculiarly fatal if suffered to run, but the curative magic of this preparation at once disarms them of their terrors. In all respects it fulfills the conditions of a popular medicine.

Be sure you call for and get the genuine Pain-Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine.

Directions accompany each bottle.

Price 25 cts., 50 cts., and \$1 per Bottle.

Sold by all Medicine Dealers.

WARING ROCK DRILL COMPANY.

SOLE PROPRIETORS AND MANUFACTURERS OF

WARING'S IMPROVED SELF-FEEDING

Rock Drill.

BY FAR THE MOST

Simple and Effective Machine

MINING, RAILROAD AND QUARRY WORK.

Office, 835 Broadway, Cor. 13th street,

NEW YORK.

THE PACIFIC REDUCTION WORKS,

GUIDO KUSTEL, Superintendent,

WILL PURCHASE

Gold and Silver Bearing Ores, Cupiferous Silver Ores,

GOLD SULPHURETS, ETC., AT THE HIGHEST RATES.

OR WORK THE SAME FOR OWNERS' ACCOUNT.

The works will commence operations on or about the 1st of April. Sampling, Assaying of all kinds of Ore, and working of small lots of ore in any desired way, will be promptly attended to and reliable results returned.

OFFICE—210 FRONT STREET, SAN FRANCISCO.

Continued from Page 197.

but slow progress has been made during the past week.

UTAH.—The main west drift at the 1,400-ft. station is still pushed ahead, running through quartz clay and porphyry mixed. The face of the drift is still perfectly dry, leading to the conclusion that the main ledge has not yet been cut.

WOODVILLE.—The erection of new hoisting-works is making steady headway. The main north drift on the 300-ft. level of the old incline is being continued.

BUCKEYE.—The east drift from the 1,500 ft. station is still driven vigorously ahead, the face in quartz and porphyry.

LADY BAYAN.—The new shaft is now down 32 ft. Three shifts of men are employed, working night and day, and excellent progress is being made.

MINY.—The new hoisting-works building, and the erection of the new hoisting-machinery, is rapidly approaching completion.

MONTZUMA.—The streak of ore, recently developed in the bottom of the shaft, is gradually widening out as sinking progresses.

DANER.—Sinking the main shaft is making the usual good progress, the rock in the bottom working much softer.

JUSTICE.—The operations of the company are now confined to sinking the main incline. It is now down 70 ft. below the 400-ft. level and the work is progressing finely.

EUROPA.—A winze is commenced and being actively sunk in the north drift in the main tunnel, near the west wall of the ledge, at a very eligible point for finding a good ore body. The indications thus far encountered are very favorable.

SUTRO.—The main north drift is being driven forward rapidly. It is now in a distance of about 152 ft. Streaks of lively looking quartz are encountered all along, assays of which give \$12 to \$20 per ton.

BALTIMORE CONSOLIDATED.—Sinking the shaft is making rapid headway. The erection of new machinery is making steady progress.

KNICKERBOCKER.—Sinking the shaft is making rapid headway, the rock in the bottom blasting finely.

ALHAMBRA.—The erection of the new hoisting-works building is making as rapid progress as the state of the roads will permit.

TYLER.—An addition of 14300 feet has been made to the hoisting-works building, to make room for the two hoilers. Sinking the shaft for a new level has been commenced.

SEGREGATED ROCK ISLAND.—The drift west, to connect with the old shaft for the purpose of ventilation, is making fair headway, as is also the drift running parallel with the ledge toward the American Flat line.

FLORIDA.—The winze being sunk below the north drift or crosscut, is now down 21 ft., and the quartz encountered looks very favorable, giving some pretty good assays.

YELLOW JACKET.—Sinking the main incline is making good progress.

BULLION.—The main north drift on the 1,700-ft. level of the Imperial shaft, is still driven vigorously ahead toward the Exchequer line.

KOSUTH.—Prospecting the first station level is still being vigorously prosecuted.

ROCK ISLAND.—Everything at the new shaft is progressing favorably, the sinking making steady progress.

CROWN POINT EXTENSION.—Shaft sinking at the rate of about three feet a day. No particular change to note.

SHAREHOLDERS, TRUSTEES, AND SECRETARIES OF ALL MINING COMPANIES.

Should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

THE

WHELPLEY & STORER ORE MILL,

TREADWELL & CO.'S

UPRIGHT SAFETY ENGINES,

2 to 10 Horse Power.

MADE BY THE N. Y. SAFETY STEAM POWER CO.

Has tubular boiler, and therefore is secure against the dangers common to shell boilers. Power is taken from near the base, which avoids vibration or top-heaviness. Occupies but two feet square of floor space and is so simple that can run it. All its parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the engine can be detached from the boiler and run independently, if required. Its main points are SIMPLICITY, SAFETY and ECONOMY. For printing offices, laundries, taneries, ranches, small repair and machine shops, or for hoisting wherever a small and safe power is required, they are peculiarly adapted.

Refer to the following parties who have them in use: E. DETTRICH & CO., Bag Factory, San Francisco; PACIFIC CHEMICAL WORKS, San Francisco; ST. IGNATIUS COLLEGE, San Francisco; STEAMER "PELICAN;" STEAMER "COQUILLE;" JAS. STANTON, Mission street, San Francisco; GEN. NAELER, San Jose; S. J. FULTON PRESERVING CO., San Lorenzo; H. BREHENT, Market street, San Francisco; A. BOUTH & CO., Collinsville; J. HICKS, Los Angeles; And many others in different parts of the country.

MACHINE WORKS BRIDGEPORT, N. J. SEND FOR LITHOGRAPH

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Friday evening—which is the very latest hour we can receive advertisements.

Benjamin Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate District, Lyon county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the thirtieth day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal. 31.

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office—No. 402 Montgomery street, Room No. 23, San Francisco, Cal. mrl-1w

Buena Vista Petroleum Company.

Location of principal place of business, San Francisco, Cal. Location of works, Kern County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 28th day of January, 1874, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J. W. Adams.....	(not issued)	50	\$10 00

And in accordance with law, and an order of the Board of Directors, made on the third day of February, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, 408 California street, San Francisco, California, on the 6th day of April, 1874, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—Room 18, 408 California street, San Francisco, California. mrl-1w

Geneva Consolidated Silver Mining Com-

pany. Location of principal place of business, City and County of San Francisco, State of California.

Location of works, Cherry Creek Mining District, White Pine County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth (10th) day of February, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
H. Barroilhet.....	(not issued)	1,250	\$312 50
G. W. Babbins.....	(not issued)	1,750	1,125 00
T. T. Milliken, Trustee.....	(not issued)	2,000	500 00
T. T. Milliken, Trustee.....	(not issued)	110	27 50
T. T. Milliken, Trustee.....	(not issued)	5,000	1,250 00
T. T. Milliken, Trustee.....	(not issued)	5,000	1,250 00
T. T. Milliken, Trustee.....	(not issued)	3,145	786 25
T. T. Milliken, Trustee.....	(not issued)	2,500	625 00

And in accordance with law, and an order of the Board of Directors, made on the 10th day of February,

1874, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company

GRAND INDUSTRIAL EXHIBITION,
To be held under the auspices of the
MECHANICS' INSTITUTE
OF SAN FRANCISCO, CALIFORNIA,
Opening on August 18th, 1874

The Board of Managers herewith announces that a grand Industrial Fair will be held in the city of San Francisco for 30 days, opening on August 18, 1874.

In view of the increasing commercial and manufacturing importance of San Francisco, its contiguity to and close connection with the various countries bordering on the Pacific, the managers have constructed a Pavilion having a floor area of 150,000 feet, and have invited to it all who are disposed to come and exhibit. All exhibitors will be placed on the same footing. Motive power will be furnished free.

The building will be open day and evening, and every facility will be extended to exhibitors and visitors. Application for space must be made without delay to the Secretary of the Board of Managers, 27 Post street, San Francisco, and all inquiries will be answered and information extended promptly.

No space can be secured unless applied for before the 20th of July next: A. S. HALLIDIE, Pres.
J. H. CULVER, Secy.

THE ONE-PLUNGER JIG.

Delivered on R. R. Car at Denver, Col., or St. Louis, Mo.

Separates in one and the same operation—1. galena and sulphide of silver; 2. pyrites or blende; 3. tailings, containing no valuable parts; or, 1. gold; 2. pyrites; 3. tailings (quartz, etc.) containing no valuable parts; or, 1. copper; 2. tailings, containing no valuable parts. The One-Plunger Jig can be combined with existing stamp-mills with highly important advantages, as after amalgamation it will recover completely all fine metal and all base ores and all mercury out of tailings. It concentrates all fine metal ores to such cleanliness that low grade ores can be shipped, after concentration, as first-class ores. Its feed and discharge are automatic. Its construction offers better guarantee against loss and repairs than any other apparatus in use. For particulars, apply to the inventor, F. CAZIN, Mining and Civil Engineer, Denver City, Col.

General Agents, No. 210 Front Street.

PAUL'S AUTOMATIC QUARTZ MILL.
Attention of Quartz Miners is called to this Improved Mill as the most economical and perfect in operation. By it all Feeding, Crushing, Weighing, Pulverizing, Transmission of Ores, Amalgamating and Concentrating are done Mechanically. It is especially arranged for pulverizing ores to an impalpable powder dry, and working by Paul's Electro-Chemical Dry Amalgamating Process, which amalgamates the finer metals as well as the coarser, and produces bullion free of base, less natural alloy. For further particulars, apply to ALMARIN E. PAUL, 212-1m 318 California street, San Francisco.
PAUL'S PULVERIZING BARREL.
Attention of the mining public is called to this PULVERIZER as one of the most complete, durable and cheap means of reducing ore to any standard of fineness. They can be made of any size, and to do any amount of work from one to 100 tons per day. They are made Self-Feeding and Self-Discharging, require no attention, and make no dust outside the casing. The operation is a coarser quartz reducing the finer. These Barrels are no experiment, they are practically at work, and others being manufactured. For further particulars, apply to ALMARIN E. PAUL, 212-1m No. 318 California street, San Francisco.

Hydraulic Bearings for Shafts.

We present to our readers this week, engravings descriptive of improved bearings for shafts, both vertical and horizontal, the invention of Jerome Haas, of Battle Mountain, Nevada. The method of applying the lubricant, which is at the same time the bearing, is simple and practical, as are the mechanical means of accomplishing the object. The antifrictional bearing, or step for shafts, is applicable to both vertical shafts and those which have a horizontal thrust; it consists in the introduction of water or oil, beneath the end of the shaft, by a pressure sufficient to slightly elevate it. This is accomplished by means of a small force-pump, operated by the revolution of the shaft, while, by means of a discharge-cock on the opposite side, also operated by the shaft, the elevation to which it rises is always regulated or controlled.

Figure 1 shows the device applied to a vertical shaft. *A* is a portion of the shaft, and *B* is the step in which it turns. The lower part of the shaft is turned off, and a stuffing-box is formed by the gland, *C*, which prevents leakage from the pressure of the water, or other lubricant. *D* is a small force-pump, which is operated as follows: *A* groove, *E*, is made around the shaft in such a manner as to act as a cam. The lower short lever, *F*, is attached at one end to the piston rod, by the link, *G*, and carries at its opposite end, a friction roller, as shown, which operates within the groove, *E*, so that as the shaft revolves, it is moved up and down alternately, thus operating the pump and forcing water or oil underneath the shaft, at *S*. In order to prevent the shaft from being lifted by the pressure, to a greater height than is desirable, a discharge cock, *J*, is attached to one side of the step, and having a passage connecting with the interior. This cock is operated by means of the lever, *K*, which has at one end a sliding block, *L*, or a friction roller, which extends into a slot, *M*, which is turned around the shaft. The opposite end of the lever is connected with the handle, *O*, of the cock, by a rod, *N*, having a turnbuckle in the center, by which its length may be changed and regulated at will.

When the shaft begins to revolve, it operates the pump, and forces water beneath the shaft, thus raising it from the bottom of the step. As the shaft is raised to a sufficient height, it turns the cock by means of the lever, *K*, and allows the surplus water to escape, thus keeping the shaft at a constant height, while all the friction on the step and necessity for lubricating are avoided. The cock, *J*, and its operating mechanism, may in some instances be dispensed with, if desired, and the liquid allowed to escape freely beneath the shaft, after lifting the shaft to a certain height, in which case the pump, with its connections, need only be used. As it is now being operated, the oil or water is allowed to escape, and run back into a pan or other receptacle, from which a tube will carry it to the reservoir.

Figure 2 represents the same device applied to a horizontal shaft, such as propeller shafts, in which the bearing surface is outside of the line of the shaft. In this engraving *A* represents the base, and *B* *C* the supporting standards. The horizontal shaft, *D*, is supported in boxes on their standards. In this class of shafts the end thrust is received outside of the line of the shaft, and the box, *E*, is represented as being made large, so that its inner face will receive the thrust. A strong, metal disk, *F*, is firmly secured to the shaft inside of the box, *E*, so that one of its faces bears against the inner face of the box, and the two frictional surfaces thus formed, it is the object of this invention to lubricate.

To do this, in the first place a circular recess is sunk in the two meeting faces around the shaft, which countersink or depression extends to almost the outer rim of each face so that but a limited bearing surface will be provided around the periphery of each. The pump, *G*, is placed directly below the shaft, *D*, at a short distance from the bearing surfaces, its piston rod, *H*, being operated by an eccentric, *I*, upon the shaft in the usual way. An ejection pipe, *J*, leads from this pump upward and has its opposite

end secured in a hole in the box, *E*, which will communicate with the countersink space between the two bearing surfaces, while a suction pipe, *O*, connects it with the reservoir in which the lubricant is contained. as the lubricant can be allowed to escape freely from between the surfaces and run back into a pan or other receptacle placed beneath, from which a tube will convey it to the reservoir. The shaft, *D*, passes through a stuffing box, *E*,

Fig. 1.—VERTICAL SHAFT WITH HYDRAULIC BEARING.

In cases where oil is used instead of water, a ring, *K*, with an inside groove is employed (thus forming a semi-tube), which will slip on so that no more of the lubricant will pass through than is necessary for lubricating the bearing. A vertical shaft like that shown in fig. 1,

Fig. 2.—HYDRAULIC BEARING FOR PROPELLER SHAFTS.

over the disk, *F*, and box, *E*, so as to cover the joint formed by the two meeting faces. A hole is formed in the lowermost part of this ring, into one of which a tube, *m*, is inserted, the opposite end of which communicates with the supply tank. This grooved ring and tube convey the escaping lubricant back to the reservoir from which it can again be used over and over again. Usually this ring will not be required

lubricated in the manner described, has been running for some time at the Golden Gate Flouring Mills in this city and gives good satisfaction. These inventions were patented through the SCIENTIFIC PRESS Patent Agency by Jerome Haas who may be addressed as above for further information concerning them.

SAMUEL J. CURTIS has been appointed Superintendent of the Ophir mine.

Opening of the Season.

We hear reports from all sides of the cessation of the winter storm, and now the hydraulic claims which have lain idle during the winter months, are beginning work in good earnest. The abundant supply of well packed snow, in the mountains of this State, ensure a most welcome supply of water for mining operations of the season, and the miners are taking advantage of it. They will begin work early and continue late in the summer, so that we expect that the California hydraulic claims will this year yield a much larger amount of gold than they have heretofore. Many new claims are being opened and developed, and the abundance of water has given opportunities for ground sluicing in many localities, in gulches and ravines, that have never been worked before.

The locations of the respective mines, of course, determine the time when work can be started up. In some parts of Trinity county, they have been washing since January; this in the lower parts of the county, about Weaverville, etc.; above, they did not begin so early, but the claims are now in full blast. As high up as the vicinity of Moore's Flat, and as far down as Sweetland, Nevada county, the miners have been interrupted by the snow until now, but at present the mines are generally running. In Calaveras county, hydraulic mining is rapidly becoming the leading interest, and new locations are constantly being made. In most instances these enterprises are largely remunerative.

Our English friends are turning their attention more than ever to hydraulic mining, and it is probable that many sales of this class of property will be made during the season to English capitalists; and we ourselves are learning to conduct this class of mining with more economy and system, and increasing the profits as we understand them better. Undercurrents, which have been used in certain parts of the State for several years, are now being more generally introduced with the usual success, and they are now found in nearly all localities. Bank blasting, for facilitating hydraulic operations, is rapidly growing in favor, and the system is being inaugurated in many parts of California where it has not heretofore been used. After the banks have been shattered and loosened by the force of powder, the water has a much greater effect on them, saving not only time but water, which, to the hydraulic miner, is equivalent to gold. The quartz-boulders in many of these claims are now picked out and thrown into separate piles from the waste, as are masses of cement, which are afterwards crushed at the mills.

While the hydraulic claims are starting up, many quartz claims are also commencing work with renewed vigor. There are thousands of mines in the mountains of this coast which are unable to ship much ore to mills during the winter, which are now employing more men and doing more work. For the next six or eight months the mills and smelting works will be kept busy taking in work and turning out silver and gold in exchange. The mining regions at this season of the year present scenes of activity and vigor, and on all sides may be seen preparations for active operations. That the coming season will be a good one there is no doubt. From all quarters comes news that new mines are being opened, new mills started up or being built, new smelting works erected and new discoveries being made. The only drawback that we know of to the mining interests of the coast are the uncertainty of what laws may be passed by Congress affecting them, and the unusually high price of quicksilver.

BURGLAR-PROOF SAFES.—Hill's Safe and Lock Company have just delivered to the Bank of British Columbia, in this city, two magnificent safes—one for securities and the other for coin. This company claim important advantages in their safes over those of other manufacturers, and they are rapidly introducing them on this Coast. A serious fault in the construction of safes is the liability of wedging, which is entirely guarded against in these safes, by dove-tailing the door to the door-jambs.

CORRESPONDENCE.

Mines and Mining in Plumas and Sierra.

[By our Special Correspondent.]

EDITORS PRESS:—It was my attention to have given you a letter last week, but the snow storms prevented my complying with my desire. Since my second letter was written, the storms in the mountains have piled the snow up to such a depth, that were I to name it here, I might not be believed; but I will venture to say that it is sixteen feet in depth on the level in this town, which I make my headquarters. In my last letter I had completed my review of the mines of Plumas county, at La Porte. Sierra county mines will comprise the subject of this and several other letters yet to come.

After leaving La Porte on the road to Howland Flat, we cross Slate creek, a tributary of the North Yuba river, but a short distance below St. Louis. This creek is from twenty to thirty feet in width, and some twenty or thirty miles in length in its snake-like windings, and is considered by all practical miners to be one of the richest tailing claims in the State, having received within its rocky banks the rich deposits of all the great hydraulic and drift claims in the Slate creek basin for over twenty years, which, without the shadow of a doubt, have deposited millions of dollars in its channel. The flow is easterly, and the numberless claims emptying into it are furnishing a further supply for the future. I must dwell at length on the resources of Slate creek, and I hope your readers will not think I am interested in any of the claims embraced within its borders, as I am not.

Capital

Is all that is wanting to open up one of the best mining districts in the State. You who have capital, listen to what I say, for as an old practical miner, I tell you. Let not this portion of the Sierra's wealth pass into English hands. Already I am informed, English capitalists are making strenuous efforts to get possession of this creek. Foreign capital is fast centralizing and controlling our mines; and whose fault is it, pray? It is the fault of the sleepy-headed American capitalists, who are to be seen hovering around the Merchants' Exchange, on California street, daily, dabbling in Washoe silver mining stocks, instead of developing the resources of their own State.

Slate Creek

Is mostly owned by small companies, who own but a few hundred feet; and whenever they can work, they average from \$8 to \$100 to the man per day. The only extensive mining companies on the creek are the Eureka and Alturas. The Eureka Company own some two miles of the creek, from the St. Louis bridge, upward. They have run a tunnel through a sharp point in the vicinity of the bridge, several hundred feet in length, in which the company have placed a flume. But owing to the low grade for several miles downward, from the mouth of their tunnel, they are unable to work their ground to advantage, until the company below them open up a passage way.

This company—the Alturas—own three miles of the creek, extending from the bridge below St. Louis, a distance of 1,200 feet, below the mouth of Rabbit creek, where they have cut a tunnel through the solid rock, at the bridge crossing from La Porte to Port Wine, in order to turn the water, in case of a great freshet, from destroying the bridge. The great advantage derived from this tunnel by the company is this: They are enabled to draw down the tailings several feet lower, for about one-eighth of a mile, which part they have worked with good results. If the tunnel was lowered, and wide enough, (12 feet is the width now), so as to carry off the tailings to a better advantage, it would be of immense value to the company, as they are the owners of an efficient fall below to make their claim, as well as the Eureka, above them, one of the best paying tailing claims in the State. Below them are numerous claims owned by companies embracing as many nationalities. The Chinamen pay a high rent for their ground, and work it the year round without any expense to the owners. The original gold in the channel is very heavy, some pieces having been found worth several hundred dollars. With the investment of capital, the great lever power of the world, Slate creek, from the St. Louis bridge to its mouth, having, as it does, a fall of 2,000 feet, would become one of the best paying mines in the State.

At St. Louis we find the following companies, all of them being worked by hydraulic: Morgan & Donhe, Emory & Pfarr, McCrary & Stahl; all of whom own their water privileges, thus relieving them of a heavy water tax. There are several smaller companies who have to pay twenty five cents an inch per day for the water used on their claims. St. Louis has given to the financial world millions of gold, and her gilded flood-gates are still open, through which is still pouring her glittering ore.

In going still further upward on the eastern channel of the Slate creek basin, we come to Sacket's Gulch, formerly known as Solomon Hill. These claims are still paying the owners good dividends, as in days of yore. Wolf and Brother are the owners. We next reach

Chandlerville,

Now owned by but a few companies. Cox & Co., have worked ground with great success, that was considered of little, or no value, on account of its iron nature. Campbell and brother are working ground outside of what is known among miners as the rim-rock, and are making it pay well. For want of time I must close this letter, as the mail will close in a few minutes. MAXIMILIAN.

La Porte, March 18th, 1874.

Trinity County Notes—Continued.

Weaver Basin and the Hay Fork.

Below McGillivray's ranch there is but little arable land within the limits of Trinity county. There are, however, a good many spots suitable for the plow, in the broad, circular, but irregular valley, known as Weaver Basin. The largest, as well as the most highly improved farm in this locality, is that of Dr. Ware, situated one mile north of this place. Here, besides an immense orchard containing almost every kind of fruit, some of it semi-tropical, are several fields yearly sown to grain, not to mention long rows of bee hives, trellised grape vines, groves of ornamental trees, and a whole village of out-houses for the protection of chickens, cows, horses, and other domestic animals; everything here also being marked by a sort of magnificent expenditure and rude abundance. Nearly every house in Weaverville has a large garden attached to it, the most of them well filled with fruit trees, vegetables, vines, plants, and flowers, while all the principal streets are lined with cottonwood trees, some of them seemingly large enough to have stood where they are for half a century. Along Weaver creek, nearly all the way from this place to its junction with Trinity river, occur, at short intervals, patches of alluvial land, all the sites of pleasant homesteads being inclosed and under cultivation. Over on the Hay Fork, the main branch of the south fork of Trinity, are a number of fine farms, on which a large amount of hay is cut; some of it made from the growing grain, and some from the natural meadows. There are also a great many cattle kept here. The most of this stock is retained in the valley through the winter, being fed on the hay, for which there is no other demand.

Undeveloped Agricultural Resources, Grazing Lands, Etc.

The above mentioned places include about all the land naturally adapted to agricultural purposes in Trinity county. As the soil is generally rich—there is, however, much land besides this that could, by irrigation and careful culture, be made to produce good crops of vegetables, grasses and grain—the soil and climate being almost everywhere well suited to the growth of most kinds of fruit, and even the vine and some semi-tropical products thriving, except in more elevated localities. There is no end to the fruit, all of the best quality, that might be raised here were there only a market for it. Already there is more produced than can be sold or even given away, almost every household growing more than enough for his own use; the distance and freights to San Francisco, the only available market, being too great to admit of any being sent away. Yet I believe the winter apples raised here could be shipped to your city and sold at a profit, for surely no person who had ever tasted of this fruit would ever again consent to buy or even eat the filthy and corrugated trash that is sold there under the name of apples.

The agricultural capacities of Trinity county could be immeasurably increased with irrigation; and when the time shall come, as it soon will, that her innumerable mountain streams shall be applied to that purpose, being diverted for a few weeks every summer from use in the mines, then shall we see her thousand hills yellow with grain fields and green with clover; then will every eminence be planted with orchards and vineyards, and every valley with gardens. Farm houses and homesteads will be multiplied; sheep and cattle will swarm everywhere; great haystacks being put up and held for their use avoiding the necessity that now exists for driving stock elsewhere for subsistence every winter. This country abounds in the wild grasses which afford sufficient summer pasturage to sustain a large amount of stock. Comparatively little, however, is kept here, owing to the expense and trouble attending their annual removal, the herdsmen being compelled to drive the most of them over the mountains into the Sacramento valley or westward into the coast region on the approach of winter. As yet irrigation has not been extensively practiced here, farming operations having been mostly confined to the rich alluvial lands where it has not been greatly needed.

Her Wealth of Woods.

Trinity is a well-timbered county both as regards the quality and the variety of her woods. The hills are covered to their summits, and the mountains far up their lofty sides with magnificent forests consisting of pine, spruce, fir, cedar, oak, and a great variety of other trees. The coast and the Sierra Nevada ranges of mountains, having traversed a space of five hundred miles; and, though separated only by a single broad valley, through climates essentially unlike, come together here; and bringing the tree, plant and shrub common to each, have commingled them on these hills, producing a beauty and a wealth of woods not often

elsewhere met with. Here can be seen the sturdy oak, the scrubby menzinita, and the stately conifer; the ash, the maple, the madrona and the wild nutmeg clustering on the hills, with the eucalyptus, the cottonwood and the balm of Gilead growing in the valleys; the air being redolent with the perfume of fragrant shrubs, and the face of nature illuminated with countless millions of bright flowers during the spring and early summer. Such a gathering together of vegetable growths renders this an inviting region to the botanist; who, besides this great variety of recognized species, will find here at least one tree not met with elsewhere in the State; and, quite likely, wholly unknown to science. Of this tree, there is here, so far as I have seen or been able to learn, but a single specimen. It is an evergreen, apparently of the cedar family; of symmetrical, conical form, about 30 feet high and very beautiful. It stands on the summit of Buckeye ridge, close to the trail leading from this place to the Atkins and Lowden mines, situated a little further down the ridge. I have been thus particular in pointing out its exact location that the naturalist may be able to find it without trouble and classify it, if it shall be found to belong to any already known species, and immortalize himself by conferring his name upon it should it turn out to be *sui generis*.

H. D.

Weaverville, Trinity county, Mar. 20, 1874.

The Yellowstone Country.

A correspondent of the *Avant Courier*, W. C. Davis, writes to that journal as follows: I have been much interested in, and pleased at, the success of the Yellowstone Expedition that recently left your enterprising town, and I should certainly have made one of the party had not pressing matters prevented.

In 1866 I passed through the country the present expedition is destined for, in company with Messrs. Cowan and Lewis. We crossed Powder river at Fort Reno, thence via Ft. Phil Kearney to Tongue river. While encamped on Tongue river, at noon, I prospected three pans of gravel from a bank about twenty feet in depth that had been out away by the river, each pan yielding from 15 to 20 colors of round gold, that could be easily saved in sluicing. I was the only miner in the outfit, having mined the two previous years in Montana, and I thought the prospects very encouraging. From thence we crossed the country to the Big Horn river, crossing it where Fort C. F. Smith now stands. Here we encountered a large body of hostile Indians supposed at the time to be between three and five hundred. The day before we reached the river they stole and ran off the stock of Beere and Robinson.

We had to keep double guard here over the stock and trains while crossing, but notwithstanding, I found an opportunity to prospect a few pans of the river wash and I got as high as two to three cents to the pan. The gold was scale gold and light but quite bright, and to the inexperienced men that were with me there seemed to be much more, and it created quite an excitement in camp. I think there are men now living in Galatin county who were with me at the time I made these prospects, and can vouch for the truth of my statements.

If the Yellowstone expedition is not prevented by the Indians from prospecting the Big Horn and Tongue rivers and their tributaries, I have no doubt they will find good paying mines.

Thinking the above might be of interest to your readers, now that the attention of so many is directed toward the Yellowstone, I send it to you for publication. Very respectfully, W. C. DAVIS.

(Messrs. Editors:—I have been acquainted with Judge Davis four or five years, and think that he is a man of truth and veracity. Respectfully yours, CAPT. H. COOK.)

CHROMIUM IRON.—E. L. Barnes, formerly of Petaluma, has made a discovery which may prove of much importance. During the mining excitement which occurred in this county some years ago, a metalliferous cropping near the town of Cloverdale was prospected for copper, and abandoned. Mr. Barnes, by chemical analysis, discovered that the metal was chromium iron. He purchased the claim and has commenced work with a force of ten men. He expects to ship about 20 tons per day, of the ore, to fill a contract made to furnish 1,000 tons in San Francisco, from whence it is shipped to England for reduction.

Chromium or chromium is named from its tendency to impart beautiful colors to its combinations. It affords the base for colors which will stand the great heat necessary in the manufacture of porcelain; alone, it gives shades of green; with other combinations, it gives the color known as English red. One of its compounds, bi-chromate of potash, is used in immense quantities by calico printers. The variety of colors which may be produced from the numerous combinations of chromium, and the permanent quality of many of them, give great interest to the substance, and the full benefit to be derived from it are yet far from being appreciated.

Chromium is found in many localities of the United States. At the Bare Hills in Maryland, it has long been profitably worked and shipped to England. The Baltimore ore yields from 40 to 60 per cent. of the oxide.—*Sonoma Democrat*.

Cherry Creek.

There was considerable excitement about the above camp last fall, but the severe winter coming on, served to cool the ardor of our miners, who thought of trying their luck in the new El Dorado. From Mr. Flemming, an old-time Eureka foreman and superintendent, who has lately returned from Cherry Creek, after a sojourn of several months in that place, we learn some particulars of the general outlook of the new district. He informs us that matters have been rather quiet during the winter, but he appears quite sanguine that the coming season will witness a more cheerful condition of affairs. Indeed, he thinks the district possesses considerable merit—enough, in fact, to support a prosperous little community. One of the chief institutions of the district is the Teacup & Geneva property, controlled by John R. Murphy and George Bibbins, both formerly of Eureka. This property is very promising on high grade ore, a strike having been made a few days ago in the Teacup, from which assays were obtained ranging as high as \$2,000 per ton. The Egan mill, under lease, is also connected with this property. There are about 1,000 tons of good ore at the mill. The mill was put in motion lately, and run successfully for two days, but severe weather setting in, the pipes froze up, and a suspension of operations became necessary. County Assessor T. R. Cranley, of White Pine, is superintendent of the mines, and Mr. Kimball has charge of the mill. About 40 men are employed by the company.

The Chance & Baltic, Frank Hallowell, superintendent, is another good property. George Treat, owner of the celebrated racer, Thad. Stevens, is one of the principal shareholders in the enterprise. Recent developments in the Chance are reported as extremely flattering. The Tehama mill (20 stamps) is being worked by this company from Schellburn.

The Cherry Creek Consolidated is considered to be one of the main institutions of the district. E. B. Dickinson, formerly connected with the Lemon company, in this place, is the superintendent. The consolidation is composed of the Grey Eagle and Mark Twain mines. Everything is progressing satisfactorily under the able management of our friend Dickinson.

The Star mine, owned by Tip, Johnson and his brother, both old-timers in these parts, is likewise showing exceedingly well in good ore. They have reached a depth of about 100 feet, at which point drifting is to be commenced.

The Flagstaff & Grand Trunk were bonded a few days since to Joe Potte and Thos. N. Browne, of Hamilton, for \$30,000. They intend to organize a company for the development of the property immediately.

The Meridian is a mine owned by B. T. Brown, at one time Mining Recorder of Eureka district, and James Pierceon, who officiated here for a long time as clerk of the Phoenix Company. The Meridian is looked upon as a very valuable mine.

The Hunter creek district is situated something like 15 miles west of Egan. One company of prospectors have a monopoly of the best locations. John R. Murphy has recently bonded all of the leading mines of Hunter district, with a view of developing them the coming season.—*Eureka Sentinel*.

WASHOE ORES FOR THE CENTENNIAL.—Mr. Donaldson, a member of a large committee appointed to collect specimens of ores of the precious metals for the Centennial Exhibition, who has been in this city some days, has already secured specimens of the ore of most of our leading mines. He takes samples of ore from the various levels of all the mines he visits, making a note of the depth at which they are obtained, and other particulars, and, when completed, his collection will be a most perfect representation of the Comstock lode. In all, he has gathered about a ton of samples, and now has them all properly labeled and boxed, ready for shipment. He has visited Idaho and Montana, where he made similar collections, and has also visited the various mining towns of Eastern Nevada. His collection is independent of those that the States are expected to make on their own account. Each State is expected to send its collection of ores and minerals, made in its own way, just the same as though the present collection had not been made. At the conclusion of the Centennial Exhibition, the collection made by Mr. Donaldson and other members of the committee to which he belongs will remain the property of the United States, and will probably be given to the Smithsonian Institute, or some similar institution, where they will be preserved for all time.—*Enterprise*.

NEW MINE.—A mine rich in gold and silver, says the *Nevada Tribune*, has been discovered in the hills north of Carson and about two miles distant. Messrs. L. D. Brown, the auctioneer, C. E. Joy, his cousin, Lay and Al. Bryant, of Mill Station, are the discoverers and original locators of the mine. A quantity of rock has been taken from the ledge and samples sent to Virginia City for assay. The ledge is well defined and runs from one to three feet in width. The rocks show free gold and horn silver. Claims were yesterday taken up for miles, and a general prospecting may be expected. The ledge is traceable all along the ridge to American Flat. A practical miner and assayer tested a piece of ordinary rock yesterday, and gave as a result \$50 to the ton.

SCIENTIFIC PROGRESS.

Friction Matches.

The history of the introduction of phosphorus corresponds with that of many other most important agents. It remained for more than a century and a half without special attention, and it was not until the introduction of friction matches, that a demand for it sprang up in an industrial way. It is indeed strange, when inventors were for many years active in devising means to obtain fire or combustion, without the use of the flint and steel, that phosphorus was not thought of. For a period of fifty years, the most determined efforts were made to get rid of the old tinder box, and the number of contrivances adopted was very large. Mixtures of sugar and chlorate of potash, which, ignited by a drop of sulphuric acid, suggested the "oxymuriate matches." These were inflamed by thrusting a splint of wood dipped in sulphur, and covered with the mixture, into a bottle containing asbestos, saturated with the acid. When this form of match first came upon the market, they sold as high as two dollars the box, each containing fifty matches. The rapid combustion of chlorate of potash and sulphide of antimony when made into a paste and dried, and subjected to friction, suggested the lucifer match. These forms of matches, together with many others manufactured prior to 1834, were all disagreeable and dangerous, and they were also too expensive for common use. About 1834, the happy idea was suggested by an English chemist, that phosphorus might be safely substituted for the sulphide of antimony in the construction of matches, and soon afterwards it was ascertained that a phosphorus paste, in which the antimony was omitted altogether, afforded the cheapest and best match. It was found that a simple splint of soft wood, first dipped in melted sulphur, and then in a paste made of phosphorus and glue, with a little fine sand and red ochre, supplied the most convenient, cheap, and safe match that could possibly be devised. This is the match which has held its place up to the present time, and is in common domestic use in all parts of the civilized world. To prevent this match from igniting spontaneously, or by handling, a film of gelatine covers the phosphorus paste upon the end, and it is only when this is disrupted by friction, that the phosphorus is reached and ignited.

The Dutch chemist, Brandt, who laboriously drew forth phosphorus in minute quantity, and by a tedious process, from liquid excrement, little thought that his chemical novelty would in after time be manufactured by hundreds of tons, and be not only found in every household, but made the kindling-spark of all hearths in every civilized country. One of the largest manufacturers of phosphorus in Europe has stated that the whole stock of the article in the chemical establishment where he was trained, consisted of a little stick two inches long. He has lived to see it pulled by his own machinery, in a cord uncoiled miles long, and dispatched by the ton together, for use in both hemispheres. The chemist still lives in London who first produced phosphorus for use by the friction match manufacturers, at \$2,500 per pound. Now demand and competition have reduced the price so low that a single pound can be bought in this city for about one dollar. The article is not made in this country, but we can see no reason why it may not be, as we have the necessary materials, bones and coal in abundance. The production of phosphorus (which is now obtained from bones) requires a large consumption of fuel. At least 100 pounds of coal are required to secure one pound of the element, and the intensity of the heat is such as to rapidly destroy apparatus. The labor, also, is not only disagreeable, but dangerous; as, through inattention, fearful explosions of the retort sometimes occur.

It was at one time feared that the demand for bones, for agricultural purposes, would so enhance the cost and diminish supply, as to raise the price of phosphorus to a high point. But the discovery of the immense deposits of phosphatic rocks, in this country and elsewhere, has set at all rest apprehensions of this nature. We have phosphorus enough quietly resting in the South Carolina rock beds, to meet the demands of the world for thousands of centuries, and no one need be anxious concerning a full supply, at cheap rates, of the indispensable friction matches, during his own lifetime at least.—*Boston Journal of Chemistry.*

SIMILIFER.—We have recently seen some specimens of a new combination of metal, christened by the French inventors "Similifer," which is stated to be as malleable as zinc, and not liable to oxidize, while at the same time it is capable of receiving as high a polish as steel, and can be either gilt or bronzed as desired. The specimens exhibited at the Royal Institute of Architects were in the form of round cyphors about 10 inches in diameter, and suitable for the center of a wrought or cast iron balcony. The expansion is about the same as copper and two-thirds that of iron, while, owing to the facility of working, the cost is very moderate.—*Br. Trade Journal.*

WOOD AND STRAW PAPER MAKING IN FRANCE.

—The improved processes of making paper from wood, straw and various grasses, as practiced in France, now enable the manufacturers to recover 85 per cent. of the caustic alkali used in the reduction of the raw material into pulp. This is a very important economy.

In order to convert wood into pulp, a strong solution of the alkali is necessary. One pound of carbonate of soda is required to produce four pounds of pulp.

By steeping the wood or straw in the alkali solution, the resinous and other gummy matters are separated from the fibers of the material, and become mixed with the solution. To regain the soda for re-use is now the object of the manufacturer. This is done by evaporating the water by heat, then charring the resulting mass, which yields carbonate of soda then converting the latter into caustic soda.

The evaporation is effected by passing the products of combustion from the fire which heats the alkaline solution through the liquid which is to be evaporated. For this purpose the liquid is thrown up in the form of a thin spray, by paddle wheels. Twelve and a half pounds of the solution, it is stated, are evaporated for each pound of coal consumed. The carbonate of soda is then subjected to long continued washing in a peculiar apparatus until it is fit for burning, and at last 85 per cent. of the original quantity of the alkali is recovered. The former methods only permitted the recovery of from 50 to 60 per cent. of the alkali.—*Scientific American.*

THERMO-ELECTRICITY IN IRON SHIPS.—There is a curious point, says *Broad Arrow*, in connection with the deviation of the compass on board iron ships which is now beginning to attract the attention of scientific men, and may therefore perhaps be new to some of our readers. It is now believed some of the sudden and hitherto unaccountable changes in the deviation of the compasses of iron ships—which are often unsuspected until alleged as the only conceivable cause of the vessel running ashore—are the effects of an unequal and varying distribution of heat over the iron hull, for it is well known that electricity is generated in a metallic substance by heat applied in a certain way, and, in fact, there is a branch of electrical science called thermo-electricity, devoted to the investigation of phenomena of this kind. Sudden slight changes of compass deviation, not exceeding five degrees, have been noticed on board iron ships on the North American coast, between Sable Island and Nantucket, and these are now attributed to changes in the temperature of the hull, occasioned by the vessel passing from warm to cold water, or vice versa. The warm temperature of the Gulf Stream, taken in connection with the cold counter-current, is considered to be quite sufficient to account for many of the suspected compass errors on board iron ships in the North Atlantic, and the recent loss of the City of Washington may perhaps be explained in this way. At all events, the question is one which ought to be thoroughly investigated.

THE PATENT SAFETY BLASTING POWDER.

The following description is given by a contemporary of the manner in which a patent safety blasting powder is now manufactured in South Australia. Operations are carried on at Alberton in a weather-board building, roofed with galvanized iron. The length of the whole is but 28 feet with a width of 14, and a height of 10 feet, and it has one small window and a door on the western side. The first operation of a series of experiments tried to test the efficacy and safety of this powder was performed by the worthy manager pounding for a considerable time some of the powder on an axe-handle with an ordinary hammer, without producing the slightest effect. Next, its character as proof against friction, was demonstrated by the same appliances, and with an equally satisfactory result. Its superiority as a non-explosive article was next determined by a number of vessels being filled and ignited, when a considerable time elapsed before the powder was consumed, and the flames died out. A common mustard tin, 6 in. by 3½ in., and containing 2 lbs. of the compound, was first used, the ascertained time before its contents were entirely consumed being about half a minute. Next an iron pipe, 16 in. by 1½ in. with 2½ lbs. of powder, was found to occupy one minute and eight seconds in burning, the orifice being smaller. Another pipe, 6 in. by 1½, and containing half a pound of powder, took twenty-five seconds in exhaustion.

ENGRAVING IN RELIEF.—This is a substitute for wood engraving by deepening or hollowing out by means of acid the parts usually cut to the full depth required with a graver. The drawing is etched on the plate, and the raised parts obtained by a deposit of metal, then the parts in relief are covered with an acid resisting varnish, and the remaining parts are hollowed out to the required depth by means of acid, this process being repeated as often as necessary for producing the greatest depth required.

According to the *Swiss Times* there is a scheme on foot for a railway to the peak of Mount Pilatus, similar in construction to that of the Rigi. It will start from Alpnach; the medium gradient will be one in eight, and the maximum one in four and a half; two bridges will be required on the route.

MECHANICAL PROGRESS.

Iron Shipbuilding.

There has been a great deal of regret manifested at the decline of the shipbuilding interest in America, which before the war was so flourishing, and which formerly sent out vessels from American ports which, for hearty and sailing qualities, were often in advance of the mercantile marine of all the world. It had been fancied that builders could never compete with the iron shipbuilders of the Clyde, while wooden vessels would not answer for ocean steamers.

Nevertheless, there is a good deal being done in iron shipbuilding in America. For instance, Mr. John Roach, who is the largest iron shipbuilder in the United States, has at his establishment on the East river, New York, and at Chester, on the Delaware, 2,300 men employed, and could employ more. Within 18 months he has put into the water, or has now on the stocks, two immense steamers, each 425 feet long, 48 feet beam, 38 feet depth of hold, of 15 knots speed, and 5,000 tons burden. Also ten others of tonnage varying from 2,800 to 4,000, making in all 27,400 tons of iron shipping.

Mr. Roach declares that American-built ships are now the best in the world, and the United States will soon overtake the English nation in orders. In a comparison of prices for a ship to be built, he found that he could send out a better article for a less price than the Clyde men. Although he could get English iron a little cheaper than American, the difference was so little that he found the better quality of American iron more than compensated for the difference of price and the trouble. He will not import anything that goes into the construction of his ships, and says that the American Secretary of the Navy deserves great credit for determining to build, by private contract, part of the eight new sloops of war just ordered.

From some conversation between Mr. Roach and a representative of the New York *Journal of Commerce*, Congress had spent some 300,000 dollars to learn why American shipbuilding had declined, and had failed, Mr. Roach went to Europe, passed down the Clyde, and there studied the art of shipbuilding as the English had developed it of late. He learned all he could from the masters, and then consulted with the foremen about improvements, and rejected all machinery that had not improvements of value in it, noting all new and approved machines. When he came back and established his shipyard on the Delaware, he adopted all the labor-saving machinery, got rid of all his old machines, and so saves an immense number of hands by the operation; indeed, he saves relatively more hands than the English shipbuilders, because he has adopted, after thorough trial, not only the labor-saving machinery which they use, but newly-invented American machines. He bought 23 acres of land at Chester, at such a price that his land and machinery cost him less than the land alone would cost on the Clyde, so that he could work with less capital than the English. Besides which, his situation was advantageous, for he had deep water and railroad accommodation for iron and coal to the mouths of his docks. He selected his men for strength, many of them being farm hands and shad fishers on the Delaware, and then gave them 18 months' training under good foremen, at the labor-saving machinery.

Mr. Roach also declared that, as regards wooden shipping, there was more tonnage on the stocks in American yards last year than during any previous year. The lake tonnage of wood was immense, our coasting tonnage of wood and iron largely increasing, while at Philadelphia they had lately launched two steamers for Europe, and more were building.

Mr. Roach very nearly obtained the contract for the Antwerp line, owned by foreigners. His other steamers are for trade to South America, Mexico, and the Pacific Ocean. Other firms are building iron and wooden vessels for Europe, and the fond hopes of some, that before long there will be several American lines to Europe, and foreign nations will be supplied from America instead of England, Mr. Roach thinks likely to be realized. He disbelieves in subsidies, and says that "practical shipbuilders pray that Congress will cease to debate concerning them, and let them alone. Shipbuilders are happy—freights are high, and the prospect is encouraging to a degree which could not be conceived of a few years ago."—*Iron.*

WATER CLOCKS.—Bowls were used to measure time, from which water, drop by drop, was discharged through a small aperture. Such bowls were called water clocks. It was then observed how much water from such a bowl or cask, from sunrise till the shortest shadow, trickled down into another bowl placed beneath; and this time being the half of the solar day, was divided into six hours. Consequently, they took a sixth of the water which had trickled down, poured it into the upper bowl, and this discharged, one hour had expired. But, afterwards, a more convenient arrangement was made. They observed how high the water rose at each hour in the lower bowl, marked these points, and counted them, thus finding out how many hours there were till sunrise. With the Chinese, the water clocks, or clepsydras, are very old. They used a round vessel, filled with water, with a little

hole in the bottom, which was placed upon another vessel. When the water in the upper vessel passed down into the lower one, it subsided by degrees, announcing thereby the part of the time elapsed. When the clock with us strikes seven, the ancients counted six, and so forth. This method of counting the hour was also customary in Palestine, at the time of Christ. The water clocks had the advantage that they could be used in the night; and the Romans used them to divide their night watches, which were relieved four times, both summer and winter. Conformably to these four night watches, time was counted, not only in Rome, but wherever a Roman garrison was stationed; consequently, also in Palestine, after she had become a Roman province.—*Ec.*

THE ANGLO-FRENCH TUNNEL.—At a meeting of the British Society of Civil Engineers, Mr. Joseph Prestwich, a veteran geologist, whose name has been long connected with geognostical research in the London basin, read a paper on the geological conditions affecting this scheme, which has latterly met with much acceptance across the Channel. The contents of the paper may be very briefly epitomized. Mr. Prestwich gave sufficient reasons for supposing that the dense, impermeable stratum, known as the London clay, extends in a continuous trough, from 300 or 400 feet or more in thickness from the coast of Essex to that of Belgium; and from the experience gained in the construction of the Tower of Subway, he saw no difficulty, in a geological point of view, in the construction of a tunnel between these two points, save in the extreme distance between them—eighty miles. Where the coasts approach more closely the London clay was absent, and the tertiary and secondary formations there existing were too permeable for tunnel work. On the other hand, these rocks were underlain by paleozoic strata, through which, in Mr. Prestwich's opinion, it would be quite possible to drive a tunnel, so far as safety from the influx of sea water was concerned. But, like the distance in the former case, here the great depth, more than one thousand feet at Harwich and Calais, was the formidable difficulty. He was, however, satisfied that on geological grounds alone, the work was in one case perfectly practicable, and in one or two others, possibly so; but there remained considerations besides those of a geological nature, and whether or not they admitted of so favorable a solution was questionable.—*Iron.*

APPARATUS FOR MEASURING GAS.—An ingenious apparatus is now employed in London for testing officially the quality of the gas furnished by companies for the public consumption. The apparatus consists, first, of a gas meter which presents two conspicuous index hands, one of which revolves once in a minute, while the other makes a complete revolution during the passage through the meter of one-twelfth of a cubic foot of gas. The first of these movements, being maintained by clock-work, is constant. The second, being dependent on the velocity of flow, or what is the same thing, on the rate of burning, may be varied by varying the discharge. Since one-twelfth of a cubic foot of gas passes with each revolution, if the revolution occupies one minute, there will pass one foot in 12 minutes, or five cubic feet per hour. As the law requires that the gas shall possess an illuminating power, when burned at the rate of five cubic feet per hour, not inferior to that of 14 sperm candles, consuming each 120 grains of the combustible in the same time, this apparatus, when combined with a suitable photometer, is said to make the application of the test very easy. Before entering the meter, the gas passes through a governor, which maintains the burning pressure uniform, however variable may be the pressure in the mains.—*American Manufacturer.*

The earliest known mention of "wire drawers" and "wire millers," as those who produce wire by drawing were variously called, occurs in the 13th century, in the histories respectively of Augsburg and Nuremberg. Previous to that time we have only accounts of "wire smiths," or those who fabricated wire with the hammer. For the making of iron wire the best and toughest wrought iron is selected. Formerly this iron was prepared for drawing by hammering it out into convenient rods of nearly a half inch thickness. These rods were then extended and further reduced by a machine in which a pair of pincers were made to advance to the draw-plate, seize the protruding end of the rod, and being moved back and drawing the metal thus far, to relax their hold, advance again to the plate and repeat the process. At the present time iron, and usually steel, are prepared for the final drawing by passing between grooved rollers very accurately made and adjusted. The sizes of wire are conveniently distinguished in commerce and in their employment, by naming the actual diameters, and more commonly by a set of numbers corresponding.

MONSTER ENGINE BELTS.—We had the pleasure, a few days since, of examining a monster engine-belt. It was 44 inches wide, 297 feet long, and weighed 2,600 pounds. It is difficult to draw any comparison that will give a person who has never seen one of these belts an adequate idea of their magnitude. This belt was made for the Toledo Elevator company. It took one of our heaviest New York four-wheeled trucks and a stout team of bays to transport it to the place of shipment.—*Coal and Iron Rec.*

tatively with reference to the price paid, but it is rumored that \$2,500 expresses the sum. Mr. Emerson took possession Thursday last. We understand it to be his intention to work the mine on a very extensive scale as soon as the necessary alterations and preparations can be made. A change has also been made in the proprietorship of the hydraulic mine in Tunnel ridge, owned by Veith & Co., during the week. Mr. J. Simpson disposing of his interest—one-third—to John Veith, Esq.

BLUE MOUNTAIN.—The Heckendorn mine is now under the management of the new Board of Directors. The President, F. Smith, Esq., was here lately, returning from his mine to San Francisco, for the purpose of making arrangements with the Board for a still more extensive plan of operations on the mine, to increase the number of hands and add more stamps to the mill. The quartz pays handsomely. The vein, at the bottom of the shaft—150 feet deep—has attained 14 feet in width. More miners are already wanted there, the new superintendent intending to keep the mill running day and night. Work on other mines in that district is also being actively pushed in every direction.

IN FULL BLAST.—Stranger & Co., who for some time past have been engaged in opening a hydraulic on the west side of Stockton ridge, near the French Hospital, have got everything in order and commenced piping. The water used, having a pressure of about 150 feet, is conveyed to the mine in a 9-inch iron pipe, and everything connected with the claim is arranged for working with facility. The indications are that the mine will pay well.

EL DORADO COUNTY.

THE CEDERBERG.—*Cor. Republican*, Mar. 26: This mine needs no description. The pens of hundreds have spoken of its untold richness. E. N. Hulford, a practical miner, is the superintendent of the mine. Under his management, this mine yields amazingly, and pays a regular monthly dividend.

THE INTERNATIONAL is being worked under the management of Gen. W. A. Cromwell. The main shaft is down to a great depth, and they are now drifting north, and south, and taking out rich and paying ore in large quantities.

THE ATLANTIC & PACIFIC.—On this mine the work has been pushed vigorously, a large and paying ledge developed, and the owners consider it a second Cederberg.

INYO COUNTY.

SYLVANIA ORE ASSAYS.—*Independent*, March 21: We present below some assays of Sylvania ore made at the Swansea works for Mr. Darrah. These assays are from a lot of ore brought over by Mr. Darrah, a number of weeks ago, and were selected with a view of obtaining the actual average value of the whole of the vein matter. The bullion assay is from a piece of bullion smelted on the ground in a blacksmith's forge. Assay No. 5 is from a peculiar material found in considerable quantities in the vein and heretofore deemed worthless. Taken altogether the Sylvania ores are pronounced by foreign men to be of the very best possible combinations for smelting purposes. The actual extent of the deposit is yet to be demonstrated, as a matter of course, since the deepest sinkings do not exceed twenty-five feet, but no better surface indications, taking all facts together, could be asked for. Leaving off the descriptive remark for each parcel, the assay by number stands thus:

NO.	PER TON.	PER TON.	PER TON.
1.	77.9 oz. lead.	89.91 oz. silver.	\$116.23
2.	32.33 " "	35.23 " "	46.55
3.	45.0 " "	29.16 " "	37.70
4.	59 " "	35.23 " "	45.55
5.	60.0 " "	24.30 " "	31.42
Bullion assay		167.67 " "	216.77
888 fine, \$171.			

KERN COUNTY.

HAVILAH TUNNEL.—*Miner*, March 21: Rock continued so soft that work was suspended three days for the purpose of timbering, but is now all right. The tunnel is in 125 feet from its commencement. A large vein of decomposed quartz was struck Wednesday. The tunnel is still running against it, and has penetrated twenty feet. How large it is, is a mystery. It is a lucky "blind," and prospects well in places. All evidences point to a chimney being near.

GOON MINES.—Many good mines are in this county that would pay big, and give employment to thousands, if properly managed by capitalists.

PROSPECTING for placer diggings along Kern river is being carried on more extensively this year than any previous.

SEVERAL placer discoveries have been made this spring, but none of them are of more than average richness; if they are, the discoverers are keeping it secret.

NAPA COUNTY.

FROM THE BEDDINGTON.—*Register*, March 28: The steamer "Express" took down last Sunday 142 flasks of quicksilver from the Beddington mine.

NEVADA COUNTY.

AT WORK.—*Union*, March 28: Yesterday morning the Gold Hill mill started to work, being the first it has done for the month. We saw five or six piles of rock on the platform and teams are busily engaged in hauling more. The bad weather stopped prospecting, but the few days of sunshine that we have been favored with have been taken advantage of by our prospectors, and the result of it can be seen on the Gold Hill mill platform. During this spring this branch of mining will be brisk, because water will be plentiful.

QUICKSILVER.—Mr. James Nickerson, of Placer county, who has been for a long time prospecting for quicksilver on Wolf creek, has sold one-fourth of his claims to responsible parties for a good sum. Work will be continued on the claims sold as well as these retained by Mr. Nickerson. Experts who have examined the ore from the Nickerson mine pronounce it as very fine; as good as is to be found in the State, not excepting the mines on the coast range.

EXTENSIVE GRAVEL MINING.—The American mine, situated near San Juan, is one of the most extensive we ever visited. The Superintendent, George C. Spooner, has now in his employ about 50 men, who are engaged in drifting and washing. They use 1,400 inches of water, which comes through a pipe 32 inches in diameter. A large blast of 150 kegs or more of powder will be put off in a few days. The new tunnel, a very large one, is now in some 3,000 ft., and the three shifts are driving it ahead at the rate of about 60 ft. per month. This tunnel is 250 ft. below the one now in use, which is not low enough to wash the ground, as is known in mining phraseology, it is "out of grade." The new one, when driven some 2,000 ft. farther, will be low enough to work all of the extensive ground yet before them, and still have grade left. Water is plenty now, and both the Milton and Eureka Lake ditches are full. Water is selling at eight and ten cents an inch. The expenses incident to gravel mining may be better understood when we say that the recent deduction of from 16 1/2 to 8 cents in the price of water causes a saving of about \$150,000 a year to the American mine alone. The tunnel they are now running will cost in the neighborhood of \$200,000, but that will soon be all returned to them in \$20 pieces when the flume is ready for washing. The ground generally is hard, and the cement is almost invulnerable—water not effecting it. But the ample falls that the hill near the Yuba affords breaks most of it up. The American has been constantly worked for ten years, though prospecting was begun on Manzanita Hill twenty years ago. With a large amount of unworked ground yet ahead of them, they will require ten years more at their present immense scale to work it out.

GRAVEL MINES is this immediate vicinity are not numerous, but we have some, and they are at this time well supplied with water, without which such diggings are not very valuable. If we had three or four times as many of these hydraulic claims about here, inducement would be given to bring in ditches from higher up than any now come, and water for all purposes be more plentiful.

Just at the upper end of Church and Auburn streets, but a few steps from the business part of our town, is the old Slide mine, now owned by Mr. Reuben Thomas. We were out there on Wednesday and witnessed the process of tearing down embankments and washing away the earth through one of those patent nozzles, which are so easy to handle and perform such wondrous work. The cream was taken from these diggings many years ago through tunnels and drifts, but at that time mining was not very closely done and Mr. Thomas is obtaining far results, though only able to work half the year by reason of want of water. He hopes to be able to run till July or later this year.

Adjoining the Slide is the Dartmouth mine, which is now taking out gravel to pay expenses merely, and doing much "dead work" in the shape of a drain tunnel to carry off the water which comes in upon them from the Alta Hill mine, now idle.

SONOMA COUNTY.

QUICKSILVER MINING ITEMS.—*Democrat*, March 28: The Lost Ledge mine has been leased to John A. Robertson & Co., of San Jose, for one or two years, with the privilege of buying the mine during the lease at \$40,000. The Kentucky has been leased to W. A. Stewart, for \$300 per month, during one year, with privilege of purchase during the time, for \$30,000. On both these mines work has been commenced. The incline on the ledge in the Missouri has been extended to a depth of 30 ft. The face of the tunnel shows a solid mass of cinnabar, which will average 10 per cent. ore. There are 30 men at work. The site for two extra shafts is now being graded; they will be put up as soon as they can be gotten over the road to the mines. The Rattlesnake having been sold and incorporated, a considerable force has been set to work. We learn from the best authority that the sale was without reservation for \$52,000 cash. McKay, Snow & Sleeper, former owners, are still at Pine Flat.

THE NEW COAL DISCOVERIES.—We visited recently the new coal discoveries, made near the headwaters of Copeland creek, on the west face, and Graham Cañon, on the east face of Sonoma Mountain. The coal is of precisely the same character as that prospected on Mark West creek last summer—a kind of lignite which burns freely and slackens on exposure to the atmosphere. Whether this coal will lose the extraneous matter which it now holds, and become more solid in texture, is a question which cannot now be solved in the present state of the development of the mine in this section.

The Davis discovery is much the best ledge we have seen; its location is also favorable for a thorough test of the merits of the mine at comparably small cost. We believe that its further development will lead to the discovery of a good quality of coal for steam and domestic use.

TUOLUMNE COUNTY.

NONPAREIL MINE.—*Independent*, Mar. 28: Work on this mine, located at Deer Flat, near Garrote, is being pushed to reach the vein by

the first of June. The owner, J. J. DuPrat, Esq., was in town this week, to procure additional miners to prosecute the work. He has been engaged nearly two years, driving a tunnel in this hill, to reach the vein that was formerly worked through a deep shaft. The tunnel is now within about fifty feet of the vein. When worked, the ore yielded handsomely, but water troubled the operations so much the shaft had to be abandoned. When the tunnel taps the vein, it will be drained, and no doubt open up a large body of paying ore.

GOON YIELD.—The partial clean-up last week of the Tuolumne Hydraulic Mining claim, in Tahls Mountain, formerly known as the Rough & Ready, yielded upwards of \$1,300, for four weeks' run. The force at work was two white men and six Chinamen. Only one side sluice was cleaned up; the other side may pay as well.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—*Geld Hill News*, March 26: Sinking the main shaft below the 1,400-foot level is making rapid progress. The west drift from the 1,400-foot station is in 45 feet, and is soon expected to reach the ore vein. The ore breasts on the 1,300-foot level are being extended north and south; the ore vein continuing to widen to the southward and containing the same rich quality of ore. To the northward the ore retains its width, and appears to grow richer in quality as the work advances. At a point one hundred feet north of the ore breast a cross-cut west has been commenced, which shows the ore to be richer even than that in breasts. The north winze has been enlarged from the 1,300 to the 1,200-foot level, so as to make it 12x12 in the clear, greatly improving the ventilation of the two levels. The west drift from the 1,300-foot station is in 76 feet, and is expected to reach the ore vein in a day or two more. On the 1,000-foot level the ore vein is being prospected both north and south, and has already been developed 150 feet in length.

OPHIE.—The main south drift on the 1,700-ft. level is being steadily driven ahead to connect with the south winze from the 1,465-foot level. The up-raise from the 1,465-foot level is being pushed rapidly ahead to connect with the winze being sunk from the 1,300-foot level. Both the winze from the 1,300-foot level and the raise are being prosecuted for ventilation purposes alone, without regard to prospecting or ore developments. The north drift on the 1,300-foot level is still pushed ahead toward the north line, the face in clay with occasional streaks of quartz.

GOULN & CURRY.—The erection of the new air compressor is completed, and the entire machinery is in full operation, everything working with the utmost perfection. In another day the Burleigh drills will be attached and in full operation in both drifts on the 1,700-ft. level. The main north drift on the 1,500-ft. level has made but little progress during the week on account of the steady and heavy flow of hot water from the face, which is all that the pump can handle.

GLONE CONSOLIDATED.—The up-raise from the tunnel is still making steady progress. A drill hole is kept running several feet ahead, as it is the expectation that a considerable body of water will be encountered when the connection is completed with the old winze above. There is already a considerable seepage of water from the face of the raise, indicating a near approach to the bottom of the winze.

HALE & NEBOREE.—The main south drift on the 1,900-ft. level is still driven steadily ahead, cutting occasional streaks and stopes of ore, of which that level seems to be full, but without finding any concentrated bodies.

DATTON.—Daily yield of ore 130 tons, all of which is being crushed at Woodworth's, the Devil's Gate and Briggs' mills, with the exception of about ten tons per day, of rich ore, which is being sent to the Auburn mill for reduction. The ore breasts are both looking well and yielding finely.

CALEDONIA.—The shaft is repaired between the 600 and 700-ft. levels, sufficiently to admit of the use of the cage for hoisting in one compartment. Repairing the other compartments is making rapid progress.

LADY BRYAN.—Excellent progress is being made in sinking the new shaft, and the machinery for the new hoisting works having about all arrived, will be put in position as fast as required. The sinking of the new shaft is the most important and efficient move yet inaugurated in developing the Lady Bryan mine. The old shaft was too far west, cutting the ledge too soon and passing through it, necessitating an incline in order to follow the sharp easterly dip of the ledge.

SILVER HILL.—A breakage of some of the hoisting machinery two days since created a short delay in the operations of the mine. This, however, will soon be repaired and the full work again resumed.

OVERMAN.—The new air-compressor for driving air into the mine and running the hoisting engine, recently erected at the mouth of the winze, on the 1000-ft. level, is being rapidly placed in position and put in order for future work.

EUROPA.—Sinking the winze in the north drift from the main west tunnel, is making good progress, passing through very favorable ledge matter with occasional spots of fine ore, showing evident indications of a better concentration of the ore as greater depth is attained.

SOUTH STAR.—The roads having improved sufficiently to allow the requisite lumber being

hauled, work was resumed on this mine yesterday morning with a view to its practical development.

SIERRA NEVADA.—Daily yield 65 tons of ore, keeping the company's mill steadily running. The drain tunnel has yet about 65 feet to run to make connection with the main shaft. This sluice tunnel, to connect with the new hydraulic works, is being driven vigorously ahead.

KOSSUTH.—A south drift has been run from the main west tunnel, which has made connection with the shaft from the old upper works, giving a much needed circulation of pure air, and greatly facilitating the work throughout the mine.

BELCHER.—Daily yield, 550 tons of ore, from the 1,000, 1,200 and 1,300-ft. levels. The winze from the 1,400-ft. level has been sunk west of the ore body to the depth of 42 ft. All of the stopes and ore breasts throughout the mine are looking finely.

CROWN POINT.—Daily yield 525 tons of ore. All the ore breasts on the 1,200, 1,300 and 1,400-ft. levels are looking finely and yielding well. The bottom of the north winze from the 1,400-ft. level is still in rich ore. The bottom of the middle winze on the same level is in barren quartz. The face of the east cross-cut on the 1,400-ft. level is still in quartz, porphyry and ore mixed, with no indications whatever of soon reaching the east wall of the ledge.

JULIA.—The main south drift on the 900-ft. level is still driven vigorously ahead, following the vein of ore recently developed, which proves to be 12 ft. in width and gives promise of a good development.

MCMEANS.—The main tunnel, which is in a distance of 643 ft., has again been started up, after lying idle for a number of months. It is the belief that this tunnel has no great distance yet to run in order to reach the ledge.

KNICKERBOCKER.—Sinking the shaft is making rapid progress. As soon as the new air compressor arrives, work will be resumed in the west drift at the 400-ft. level.

SOUTH COMSTOCK.—A drift south has been started from the main east drift at the 150 ft. level, which is in 16 feet, following the fine looking streak of brown sulphuret ore. Assays during the week have averaged from \$20 to \$80 to the ton, principally gold, and continued improvement is perceptible.

UTAH.—The main west drift at the 400-foot station is still pushed vigorously ahead through the ledge to reach the west wall. A crosscut south has been started to premeet the body of quartz penetrated, which shows some very favorable spots and indications of ore.

SAVAGE.—The main southwest drift on the 1,900 ft. level, last Sunday evening made connection with the north drift from the south winze, giving a greatly needed circulation of pure air, cooling the drift and greatly facilitating the prospecting operations on that level.

IMPERIAL-EMPIRE.—Sinking the main incline below the 1,850-ft. level is making steady headway. The main east drift on the 1,850-ft. level is still pushed vigorously ahead, the face in very soft and favorable looking matter, and with the hourly expectation of reaching the ore vein.

LEO.—The face of the main tunnel still carries that vein of rich gold ore, two ft. in width, giving assays as high as \$5,000 to the ton. It continues to increase in size, with strong indications of developing into a good sized and very valuable ore body or chimney.

CHOLLAR-PORTER.—Daily yield 80 tons of ore, the assay value of which is \$30 per ton.

NEVADA.—The main south drift from the west tunnel is still driven vigorously ahead, following the streak of ore recently developed, which is about three feet thick. A cross-cut west has been run through the ore chimney, already developed, which has proved it to be 18 ft. in width, and all good milling ore.

CALIFORNIA.—The north drift from the 1,300-ft. station of the Virginia Consolidated shaft is now in 319 ft. in good running ground. The sound of the workmen in the south drift on the same level from the Ophir, can be distinctly heard, showing that the two drifts cannot be very far apart.

NEW YORK CONSOLIDATED.—Re-timbering the shaft is making rapid progress. The new boiler-house is about completed, and everything will soon be in readiness for the reception of the new machinery.

SUTRO.—The north drift is being continued and is now in 160 feet. Streaks of lively looking quartz have been encountered all along, assays averaging \$15 to the ton.

CHAPIN AND EAST COMSTOCK.—Fifteen feet have been added to the depth of the shaft during the past week. A slight increase of water has been encountered, but not enough to interfere with the work, as it is hoisted out with the dirt. The new hoisting machinery works well.

ALHAMBRA.—The new hoisting machinery from Shaft No. 3, of the Sutro Tunnel, arrived at the mine yesterday, and will be placed in position for future operations just as fast as the nature of the work will admit. The shaft is now repaired to the depth of 200 feet.

JURTECO.—Main incline down 115 feet below the 400-ft. level, passing through vein matter at present consisting of porphyry, clay and quartz in streaks. This material works very favorably.

BALTIMORE CONSOLIDATED.—The erection of the new machinery is rapidly approaching completion, and everything will soon be in readiness to resume the opening of the fourth and fifth stations.

SUCOON.—Sinking the new shaft is making the usual good progress.

Eureka Mines.

The present condition of the different mines, says the *Sentinel*, throughout Eureka and other districts, is most favorable. Important developments are being made almost daily, and appearances generally indicate an increasing permanency of the mines as the work on them progresses.

At the Richmond

The workmen are engaged in running a tunnel from the McGee shaft to connect with the mine, which is being worked through the Lisette tunnel; a donkey engine is being set inside the mine to hoist the ore to the level of the tunnel, which is then run out on cars to the northeast side of the hill. The body of ore in the mine is over 200 feet in width, which is also increasing in width and richness, though continually worked for a distance of over 800 feet.

The McGee Shaft

Is sunk down nearly 300 feet, the first level being 212 feet below the surface. As soon as the condition of the roads will allow, active operations will be resumed. The shaft is being sunk through the great ore body, with the intent on of striking the second level at a distance of 400 feet from the top. A new ore dump is being constructed at the mine for the convenience of shippers in the loading of wagons.

At the Furnaces

Of the company, during the present stoppage of work, many improvements are being made in and about the premises. The construction of the new patent flume is about completed; and when they start up again, the smoke and dust of the furnaces will be conveyed to a large chimney, fifty feet high, built on the mountain east of the works. The machinery has been put in perfect order, and operations will be resumed sometime during the coming month. During the past month 1,120,000 pounds of bullion have been shipped from these furnaces to the railroad by Pritchard's freight line.

The K K Mine.

Forty men are engaged at work in this mine. The ledge discovered a few days since a little northeast of the old Marcelina shaft, is proving larger and richer as the work progresses. As soon as the width of the vein is definitely ascertained, a winze will be sunk to connect with the third gallery. A vein six feet in width has been struck in the second level, east, which promises to be one of great richness. Three hundred and thirty-six thousand pounds of bullion have been shipped by the company since our last report, in February. The furnaces have been shut down for about a month, but will be re-opened as soon as coal commences to arrive.

The Eureka Consolidated.

A fine body of ore is at present being taken from this mine. About 100 men are at work, though the force will be greatly increased in the spring. The company has one furnace in operation, it being the only one running at present, giving employment to forty men. There are about 30,000 bushels of charcoal on the grounds, and enough arriving to keep the furnace working until the supply increases. Six hundred thousand pounds of bullion were shipped by the company during the past month.

The Ruby Consolidated.

The workmen in the Ruby Consolidated are engaged in prospecting the different levels of the mine, getting out ore, thirty tons being the average daily amount brought to the surface. About forty men are employed in the mine. The furnaces are at present shut down, but they will commence work again in a short time. It is the intention of the company to introduce coke, to be used in the furnaces, to take the place of charcoal. One hundred tons are expected to arrive in a short time.

The Bald Mountain Mines.

Owing to the great amount of snow on the mountain, work is attended with great difficulty. With the exception of the Hooeac, the mines are not proving as good as was expected. The ore is found in bunches, some of it being of extra quality, though not in large enough deposits to pay for the working of the mines.

Newark District.

The mines in this district are all looking remarkably well. Prospectors are actively at work, and the present appearances of the mines indicate great richness.

Beatty Mine,

Owned by Mr. Frank Beachman, is one of the most prominent mines in the district. Work is being rapidly advanced, and the ledge still exhibits the same favorable indications as when first discovered.

The Captain Jack,

Owned by John Manpin, Max. Oberfelder and F. J. Holland, has been worked for about three weeks, with a fine prospect of success. The ledge is at present three feet wide and rapidly increasing in size; it is running north and south, and assays of the ore made, go as high as \$250 to \$1,500 per ton.

The Newark Mining Company,

Comprising the north and south Chinnabua, Lincoln, Washington, Indian Jim, Buckeye and other mines are preparing to resume active operations as soon as the furnace starts up. The company has about seventy men at work at present, but this force will be largely augmented in a short time. The company has

expended over \$400,000 on its different mines, and during the present summer will conduct business on a grand scale. Ten new amalgamating pans will arrive in a few days for the furnaces, which will be started up about the tenth of April. The company owns the furnace, an Aiken roaster, and will be able to roast thirty tons of rock per day. The district has recently been formed, and two meetings of the miners have been held to establish a set of laws for the government of the district. The camp will be one of the liveliest in the State during the coming season, and work will be afforded to scores of men now unable to obtain employment.

The Consolidated Virginia.

The Consolidated Virginia is at present undoubtedly the big mine of the Comstock lode. An immense amount of ore is now visible in the mine, and there is every indication that the 1,400-foot level will be better than anything that has been opened above, and it is the belief of the experts that the 1,500-foot level will prove far richer than the 1,400. In the lowest working of the mine the lead has now assumed its regular pitch to the east; the walls are beautifully defined and the stratification is most regular and perfect. The character of the ore has become uniform throughout, and both ore and quartz are assuming a more lively appearance as depth is attained. The ore first found, though very rich, had a peculiar dead look, which was new and somewhat puzzling to even the oldest miners on the Comstock. Now, at the lowest levels, the familiar crystallization appears in the ore and quartz; some bright sulphurets are to be seen, and all is beginning to present that appearance characteristic of the great ore deposits of the Comstock lode—the ore has what the miners call a "lively look." In the upper levels, where the ore was first encountered, the vein was almost devoid of crystallization, and the ore had a close and "egggy" appearance, as though it had once been dissolved in water, and afterwards had hardened. It will be long before the mine will be even in its prime, though it is opened already to such an extent that immense quantities of ore can at any time be raised; and, indeed, the quantity extracted daily will shortly be greatly increased and new mills put to work upon it.

The works of the company are the most powerful, most perfect and best arranged to be seen on the lead, and their facilities for hoisting, storing and handling ore, are unsurpassed. Their dump is the most substantial on the Pacific coast, being erected upon a long and high wall of cut stone, so thick and so well constructed that it would withstand a heavier cannonade than any fort in the Union. Along the foot of this wall, immediately under the dumps, runs a side-track of the Virginia and Truckee railroad, so that any number of ore cars can be cheaply and expeditiously loaded. All that is to be done in order to load a car is to hoist a gate, placed in the mouth of a chute leading down from the dump, and the ore runs out until the car is properly filled. The blacksmith shop, carpenter shop and the several offices are all well constructed, neatly painted, and are most conveniently situated in the immediate vicinity of the main hoisting works—that is, those shops and offices which are not directly connected with the main building of the works. Thus it will be seen that not only all below, but also all above, is in the best possible shape for a vast amount of uninterrupted and most profitable mining. Unless when it shall be necessary to replace some piece of worn-out machinery, or when there shall occur a break of some kind, there is nothing to prevent the company from hoisting ore constantly and regularly (as regards quantity) for years to come. They are peculiarly well provided with railroad facilities, for while they have a side-track under their dumps at the east end of their works, the main railroad track—over which all machinery and supplies are brought—runs directly along at the west end; the main work extending, as it were, wedged between the two tracks. All that is brought to the works, as well as all that goes away, is moved down hill. As we said above, the Consolidated Virginia is now undoubtedly the big mine of the lead; some years from now, however, the big mine may again be at Gold Hill. In turn we have seen the Ophir, the Gould & Curry, the Savage, Yellow Jacket, Crown Point and Belcher, hold the position of first on the lead. When the Ophir and Gould & Curry were the big mines, some of the others named were accounted wildcat of the most untamed description. Ten years hence we know not which of our present "wildcats" may be promoted to the proud position of first mine on the Comstock range.—*Virginia Enterprise*.

PEAVINE ITEMS.—From R. P. M. Greeley, who arrived from Reno, the *Truckee Republican* learns that mining developments in Peavine are of a favorable character. The main shaft in the Paymaster mine is down over 60 feet below the first level, has cut through the ledge and is in good sinking ground. The ore continued to improve in sinking, and some of it is very rich. Mr. G. was informed that arrangements were being made to put up the roasting furnaces, required in working the ore, at once. Owing to the snow many claims in the district are not being worked but will be in a short time.

The property of the Little York Gold Washing and Mining Company, of Nevada county, has been sold to an English company for \$220,000.

White Pine Mining Outlook.

The *White Pine News* gives the following concerning mining matters in that vicinity: Emerging from the most severe winter within the knowledge of the oldest inhabitant, and with a fair prospect of clear skies and good weather in the near future, it is natural we should look around at the probable amount of mining to be done the coming summer. Among the mining interests now bearing the most encouraging aspect, we may name the Eberhardt & Aurora, the Ward Beecher Consolidated, Mammoth, Silver Wave, of free ores, and the Trench, Imperial, Mobile, and many others of base character, all of which are employing more or less men every day. The milling facilities are sufficient to work all the ore which can be extracted, but the smelting capacity is decidedly inferior. Certainty of work being pushed ahead on the majority of mines mentioned above, seems now to be established; but the result, of course, is problematical. We are confident that explorations will be energetically carried forward on all the leading mines; and, especially, on those of a base nature. The nearness of the time when re-locations can be made on mines now abandoned, viz.: June 10th, 1874, will cause many owners and locators to commence operations early in the spring in order to save themselves from loss. Undoubtedly, hundreds of prospectors will engage actively in searching out locations almost forgotten, and the result of their working will materially aid the good name of the district. We can see no reason why a prosperous season may not be anticipated, under the circumstances, and all who have so persistently waited through the months of discouragement, just passing away, be liberally rewarded. Success being the criterion of merit, we have only to hope that comprehensive work will be done to illustrate the practicability of reducing the immense quantities of base ores with profit. It is a matter of much surprise that success can not be obtained from smelting here in White Pine, with the superior advantages possessed by no other prosperous localities, and we trust that the coming year will aid us to elucidate the feasibility of competing with our neighbors at Eureka in this regard. Not only is the prospect encouraging here, but also at Mineral City, at Cherry Creek, Newark, and many other less known, but valuable districts, are being opened up, and developments being pushed ahead vigorously. Our county contains more locations than any other in Eastern Nevada, handled by men who have made mining the business of a lifetime—who, one and all—concur in the meritorious character of the same; and we can see no good cause to despair of the future.

Hydraulic Mining and Our Bottom Lands.

The people living on the river bottoms of Placer, Sutter and Yuba counties are threatened with a danger which, not many years hence, will be of serious consequence. It is the rapid filling up of deposits brought down from hydraulic mining, which is growing more extensive every year. In fact, the era of hydraulic is yet in its infancy, however true it may be that it is now extensively carried on. The immense gravel deposits along the Yuba are, practically speaking, inexhaustible. The ancient river channel, in which these rich gravel beds are found and now being washed down in the vicinity of Sucker flat, is conceded to extend through the hills as far up as San Juan. These great gold deposits, in connection with other rich mines, which are continually discovered, are drawing thither millions of capital with which to work them. The late improvements made in this mode of mining now enables the working of mines which could not be worked before. More dirt can be washed away with less capital. The amount of dirt brought down by the mining streams and deposited in the valley is surprising, and we might add, alarming. The bed of the Yuba at Marysville is already some sixteen feet higher than it was 20 years ago! Not only the channels, but the valuable bottom lands along the Yuba and on the Feather below its confluence, have been covered over with sand and sediment to a depth of many feet, and ruined. The same work of destruction is going on on Bear river and other mining streams. The worst has not yet come. In less than two years the amount of washings will be double what it is now. It is a saying among some of the miners that they are going to cover Marysville up, and we believe there is more truth than fiction in the saying. It was a sad mistake that the beautiful town was not located on the higher ground back, or on this side of the river, when it was first started, or rather the houses which were afterwards moved over on the Yuba. Yuba City was once ahead of Marysville, and at the rate it is now growing, in ten years more it will go ahead of our sister town.—*Sutter Banner*.

ANOTHER GREAT GRAVEL MINE OPENED.—We learn that the Pactolas Gold Mining Company, near Smartsville, have just made their opening wash-up, through their lower tunnel, which enables them to wash the ancient river channel which passes through that region, paying over \$800 per day. When we remember that in opening a mine washing is done at such a great disadvantage, this result is truly wonderful. This tunnel has been some six years building, and adds another proof of the hidden wealth of our country.—*Marysville Appeal*.

Pine Flat Quicksilver Mines.

A correspondent of the *Napa Register* writes as follows concerning mining matters at Pine Flat:

The Georgia, situated on the Bloodhound lode, about three miles northeast from Pine Flat, has every indication of a good mine. The outcroppings are very rich. A tunnel has been started to tap the ledge, and if the weather proves favorable, you may expect to hear something big from this claim. It is owned by the Thompson Brothers, Charles Fitch, John Nixon and W. B. Reynolds. After partaking of the hospitality of the boys of this mine, early the next morning I started for Pine Flat through a drenching rain. Dodgeville is the name of the town at Pine Flat. I am sorry that the well known name of Pine Flat has been changed to Dodgeville, but as there was another post office in the State with the same name, it was thought advisable to call it as above.

The central is located on the Sonoma lode, and bids fair to become a rich mine. Just above this is the Fall's claim on the same lode. But little has been said of this mine, yet any one can see its richness. The creek runs over the ledge and forms a fall of about fifteen feet, showing the ledge, which is well defined, and cinnabar croppings on all sides are plainly visible. Above this about a half mile is the Annie Belcher, a new discovery made a short time since by Mr. John Goldthorp, and owned by him, Samuel Walker and John Nixon. The croppings of this mine are far ahead of any that I have yet seen, and if it holds good as it goes down, it will rank A 1. The ledge shows itself plainly, and the cinnabar is very rich, and it is a wonder that this discovery was not made sooner; but it is surrounded by an almost impenetrable growth of Chinese brush, and Jack said he had to do considerable prospecting on his hands and knees. Work has been commenced here, and quite a pile of almost pure cinnabar is on the dumps.

Next we visit the Sonoma. They had their furnace running, and are taking out quite a lot of quicksilver. We pass on from here to Flag-staff No. 2, owned by Bell, Norris & Marble. This mine has lately been sold or bonded for a large sum. Next in order is the Socrates, formerly known as the Pioneer, and is under the management of Mr. W. S. Bell. Work will be resumed on this mine in a short time. This was one of the first discoveries made here, but work has been suspended for a number of years on account of the title to the mine, but now the matter is all settled.

Here we strike the Geyser road, and we take a back track toward Dodgeville, and when within one mile of that place we find the Mammoth mine, which has just been sold to an Eastern company, who have also bought other mines, and intend erecting furnaces and going to work in earnest. Just above town is the Fleetwood, another good prospect, owned by Messrs. Williams & Vick. Feeling anxious to get home, we did not visit any more of the mines, and after remaining all night, we left early next morning for home, where we arrived safe and sound.

Rev. J. Daubenspeck contemplates burning a large brick kiln in Pine Flat. The people up in that section feel a little dubious about voting a \$10,000 subsidy for a road to Healdsburg. The Kattlelake mine has been sold for \$52,000, to (rumor says) John Farrot, of San Francisco. The superintendent went below on Sunday for men and materials. The Missouri has stopped her retorts for a few days on account of the wet weather.

Finding The Latitude at Sea.

Commonly the seaman trusts to observation of the sun to give him his latitude. The observation is made at noon, when the sun is highest above the horizon. The actual height is determined by means of the instrument called the sextant. This instrument is so devised that the observer can see two objects at once, one directly and the other after reflection of its light; and the amount by which he has to move a certain bar carrying the reflecting arrangement, in order to bring the two objects into view in the same direction, shows him the real divergence of lines drawn from his eye to the two objects. To take the sun's altitude, then, the observer takes the sun as one object and the horizon directly below the sun as the other; he brings them into view together, and then looking at the sextant to see how much he has had to move the swinging arm which carries the reflecting glass, he learns how high the sun is. This being done at noon, with proper arrangements to insure that the greatest height then reached by the sun is observed, at once indicates the latitude of the observer. Suppose, for example, he finds the sun to be 40° above the horizon, and the *Nautical Almanac* tells him that, at the time the sun is 10° north of the celestial equator, then he knows that the celestial equator is 30° above the southern horizon. The pole of the heavens is, therefore, 60° above the northern horizon, and the voyager is in 60° north latitude. Of course, in all ordinary cases the number of degrees is not exact, as here for simplicity is supposed, and there are some niceties of observation which would have to be taken into account. But the principle of the method is sufficiently indicated by what has been said.—*Popular Science Monthly*.

USEFUL INFORMATION.

A New Method of Staining Wood.

The following process of making coarse wood look like polished mahogany, is recommended in *Wiederhold's Trade Circular*: The coarse wood is first coated with a colored size, which is prepared by thoroughly mixing up, in a warm solution, of one part of commercial glue in six parts of water, a sufficient quantity of the commercial mahogany brown, which is, in reality, an iron oxide, and in color, stands between so-called English red and oxide of iron. This is best effected by adding in excess, a sufficient quantity of the dry color with the warm solution of glue, and thoroughly mixing the mass, by means of a brush, until a uniform paste is obtained, in which no more dry red particles are seen.

A trial coat is then laid upon a piece of wood. If it is desired to give a light mahogany color to the object, it is only necessary to add less, and for a darker color more, of the brown body color. When the coat is dry, it may be tested by rubbing with the fingers, whether the color easily separates or not. In the former case, more glue must be added until the dry trial coat no longer perceptibly rubs off with the hands. Having ascertained in this way the right condition of the size color, with respect to tint and strength, it is then warmed slightly, and worked through a hair sieve by means of a brush. After this, it is rubbed upon the wood surface with the brush, which has been carefully washed. It is not necessary to keep the color warm during the painting. Should it become thick by gelatinizing, it may be laid on the wood with the brush, and dries more rapidly than when the color is too thin. If the wood is porous and absorbs much color, a second coat may be laid on the first when dry, which will be sufficient in all cases. On drying, the size color appears dull and unattractive, but the following coat changes immediately the appearance of the surface. This coat is spirit varnish. For its production, three parts of spirits of wine of 90° are added in excess to one part of red acaroid resin in one vessel, and in another 10 parts of shellac, with 40 parts of spirits of wine of 80°. By repeated agitation for three or four days, the spirit dissolves the resin completely. The shellac solution is then poured carefully from the sediment, or, better still, filtered through a fine cloth, when it may be observed that a slight, milky turbidity, is no detriment to its use. The resin solution is best filtered into the shellac solution by pouring through a funnel loosely packed with wadding.

When filtered, the solutions of both resins are mixed by agitating the vessel, and letting the varnish stand a few days. The acaroid resin colors the shellac, and imparts to it at the same time the degree of opaqueness usually obtained by the addition of Venetian turpentine, or linseed oil. If the varnish is to be employed as a coat, the upper layers are poured off at once from the vessel. One or two coats suffice, as a rule, to give the object an exceedingly pleasing effect. The coats dry very quickly, and care must be taken not to apply the second coat till the first is completely dry.

SEPARATION OF THE MERCURY IN THERMOMETER TUBES.—When thermometers are overturned or shaken by accident, it frequently happens that a portion of the mercury in the instrument is separated from the main column and hangs in the upper part of the tube. It is generally easy to unite this portion of the mercury with that in the bulb by holding the thermometer vertically two or three inches above a piece of card, and letting it fall vertically upon the card, or, while firmly holding it in the right hand, strike with the arm smartly against the palm of the left hand; or, further, the thermometer may be fastened to a piece of string and swung around, as with a sling, but with caution, and not too rapidly. In many cases the detached particle of mercury is so small that its weight is not sufficient to overcome the adhesion to the side of the glass tube; the following plan of procedure is then recommended: The instrument is inclined at an angle of twenty to forty degrees, so that the bulb stands higher than the tube, and a blow with a flat piece of wood is given in the direction of the thermometer stem. The mercury in the stem is thus jerked forward, and, united with the detached portion, fills the entire tube. If the thermometer be now slowly and cautiously brought into such a position that the mercury begins to flow back toward the bulb, the united column may generally be returned to its proper place. In the place where the separation has occurred a small air bubble is generally found, but by following the above directions this difficulty may be almost always overcome.—*Journal of Applied Chemistry*.

VARIEGATED COTTON THREAD.—Cotton thread may be dyed in two or three colors by covering some parts with parchment paper, tightly wound, and thin tin or lead foil, holding the latter in place by binding threads. If tied sufficiently tight when the skeins are introduced into the dye bath, the protected parts remain white; and by protecting the dyed portion, and unwrapping the white portion, another color may be applied.—*Scientific American*.

The Corrosion of Boilers.

Dr. J. S. Kidder, U. S. N., communicates to *Van Nostrand's Engineering Magazine* a paper pointing out the probable cause of the destruction of boiler tubes, and describing experiments which show the deterioration or pitted condition of those portions of the generator which are immersed in the water to be due to the action of oleate of copper. The presence of this substance is accounted for by the decomposition of the oleate oil used in lubricating the piston into oleic acid and glycerine, a sufficient frictional heat being raised to thus act upon the thin film of oil between the surfaces. In the condenser the brass tubes are exposed to the powerful comminuting impact of steam at a high temperature and pressure, and this substance is thus finely divided and placed under the most favorable circumstances for union with the free oleic acid which the steam brings with it. Oleate of copper is then formed in the condenser, and appears in bright green, greasy masses, which are carried from condenser to boiler. A quantity of this substance, settling upon one of the iron boiler tubes and adhering thereto, causes both a deposition of copper and absorption of iron. Being insoluble, its action is confined to the surface of contact, hence the small holes characteristic of this kind of injury. Copper, however, it is found, will adhere only to perfectly smooth iron, and since boiler tubes are never in this condition, each deposit is quickly removed and a fresh iron surface continually exposed. Selden's apparatus, mentioned in the report of the engineer of the navy, as a preventative of this difficulty, consists in a long iron box fitted with a steam-tight cover and placed between condenser and boiler. The box is divided into compartments by diaphragms of felt, pervious to water, and the compartments themselves are filled with coke. In referring to the placing of alkalis in this filter, Dr. Kidder remarks that soda is of questionable advantage, and that lime is theoretically the best, and then when only need in connection with a fresh water boiler. At Heckler's mill, the condensed water, after leaving the filter, is treated with atmospheric air forced through it from below. The resulting water is perfectly free from taste or odor, and quite palatable. It seems possible that the hitherto insuperable difficulties in the way of freeing condensed water on shipboard from a certain unpleasant empyreumatic odor may be overcome by similar treatment.

THE DETECTION OF BLOOD SPOTS.—Sonnenchein states that tungstate of soda, strongly acidulated with acetic or phosphoric acid, throws down albuminoid matters from very dilute solutions. These precipitates, insoluble in a large excess of water, dissolve in alkalies, especially if hot. If defibrinated blood is treated with this salt, a red-brown precipitate is formed, which becomes clotty on boiling. All the coloring matter is precipitated. To detect blood spots by this means on clothing, the suspected portion is cut off; and after having been treated by distilled water, the filtered solution is precipitated with the above re-agent. The precipitate, washed and treated with ammonia, takes a reddish-grey color. If phosphoric acid be present, it must be carefully washed away before treating the precipitate with ammonia.

AN APPARATUS FOR DETERMINING THE INFLAMMABILITY OF PETROLEUM OILS INTENDED FOR ILLUMINATION. has been contrived by M. Gramer. It consists of a metallic cylindrical vessel closed with a movable cover, in the center of which is a hole. Through this hole projects a wick, which is inserted in a tube soldered to the bottom. Another hole in the cover allows of a thermometer being fitted into the apparatus, which when used is about two-thirds filled with the oil to be tested; the wick is then lighted, and as soon as any inflammable vapor is evolved, a slight puff takes place, which extinguishes the light, when the temperature marked by the thermometer is noted. The results are said to be very accurate, and the tests can be made in a shorter time than in the ordinary way with a water bath.

CLEANING GLASSWARE IN THE LABORATORY.—Dr. Walz thus describes his method of cleaning glassware used for chemical purposes: The vessel to be cleaned is filled, or, if large, rinsed with a moderately dilute solution of potassium permanganate, the contact of the liquid being prolonged till a film of hydrated manganic oxide has been deposited; the solution is then poured away, and the glass vessel rinsed with strong hydrochloric acid. Chlorine is then formed, but not enough to cause inconvenience; and acting in the nascent state on the organic matters, it speedily converts them into substitution products, which are soluble in the slight excess of acid or water.

ADULTERATION OF TEA.—This formed the subject of an extended discussion before the recent meeting of the British Association for the advancement of science. It was commenced by a paper read by Mr. A. H. Allen. He regards the estimation of tannin in the leaves as of the first importance. The amount of tannin in genuine black tea should be about 12.5 per cent.; if it falls much below this, either it has been exhausted and then dried, or it is mixed with foreign leaves. The next point of importance is the amount of woody fiber or rather of insoluble matter; this should not exceed 60 per cent. Green tea contains about 50 per cent. more tannin than black tea. The ash should be about 5 per cent.

DOMESTIC ECONOMY.

Oatmeal.

We propose to devote a short article to oatmeal and its uses. Perhaps this may be the more suitable, as the present price of breadstuffs is so very high that many who cannot easily afford to purchase wheaten bread in the quantity and of the quality which they have been accustomed to use, may be glad to hear of a substance at once good and comparatively cheap, by which it may be partially replaced. To a very great number of people the value of oatmeal is little known; although the prejudice against it, long entertained, as an article of food rather fit for the lower animals than for human beings, has of late, in some measure, given place to a more just opinion, especially amongst the educated classes, who are capable of appreciating the value of the favorable verdict of chemists and physiologists. It is now well known that no other kind of grain is so nutritious as oats; and the facility with which it is grown on soils not rich enough, and in situations not warm enough for wheat, recommends it very strongly, as fitted to yield a very considerable part of our food supply. Oatmeal is a principal article of food of the peasantry of Scotland, and until nearly the end of last century amongst those of the north of England.

In more ancient times oats formed the principal corn crop of most parts of England; but as agriculture improved and the cultivation extended, wheaten bread was naturally preferred by those who could afford it; the use of oatmeal became more and more limited to the poorer classes; and on this very account was as much as possible avoided by those who, in respect of wealth, birth, or profession, made pretensions of superiority. Another circumstance which greatly tended to restrict the use of oatmeal where it was formerly general, was the convenience with which wheaten bread could be procured from the baker's shop, a matter of especial importance when almost all the members of a family were employed in manufactories. The revived popularity of oatmeal has recently led to the exposure of different kinds of it for sale in bakers' and other shops, particularly in Scotland.

The grain of oats intended for human food is generally prepared by being ground into meal; although it is also used in the form of groats; that is, of grain denuded of its husk, and merely broken into fragments. Oatmeal is of two kinds—both common in all shops in which it is sold—fine meal, and coarse or round meal. For various purposes some prefer the one and some the other. There is no difference in quality, but merely in the degree in which the grain has been triturated in the mill.

Oatmeal is principally used in two ways, for the making of porridge and of oat-cakes. Porridge is a principal article of food of the Scottish peasantry, generally accompanied with milk, when milk can be obtained; although when milk is scarce butter is sometimes used, sometimes sugar, and sometimes treacle beer. For most people, in a sound condition of health, there is no more wholesome article of food than porridge and milk, none that contains a larger proportion both of flesh-forming and heat-producing substances; whilst to almost all who have ever been accustomed to its use, it is extremely palatable. Generally speaking, there is no better article of food for the nursery, none more likely to maintain a healthy condition of the stomach, or to give vigor to the frame; although there are exceptional cases, both among the young and among adults, in which the use of porridge is unsuitable, producing painful distension of the stomach and indigestion. Whilst the caprices of children ought not to be heeded in such a matter, the actual conditions of their constitution ought to be carefully observed and regarded. Porridge is in general made by simply boiling oatmeal in water, stirring all the while to prevent eingeing, and to secure the thorough mixture of the meal and water into a homogeneous mass, without knots. The quality of porridge very much depends on the amount of boiling which it receives. It cannot be too thoroughly heated. Imperfectly boiled oatmeal porridge is a very coarse article of food; and, unfortunately, much of the porridge used is of this character; and the porridge prepared for the nursery is often no better, through the carelessness of the servants who wish to get through their work with as little trouble as possible. It is not nearly so digestible, and therefore not so nutritious as porridge really well made. A common mistake in the making of porridge must also here be noticed, as tending much to the deterioration of its quality, the adding of meal by degrees whilst the boiling goes on, until the proper thickness is acquired; the result being that part of the meal is imperfectly boiled. The cook ought to know the proper proportions of meal and water—knowledge not very difficult to acquire—and mix them at once, so that all the meal may be equally well boiled. But it is to be observed that the water must be boiling before the meal is put in, which is not to be introduced in a mass, but, as it were, strained through the fingers, handful by handful, as quickly as possible.

Why is sometimes need, instead of water, for the making of oatmeal porridge, and affords a very agreeable variety to those in the habit of

using porridge every day. Milk porridge is another variety esteemed as an especial luxury by the Scottish peasantry, and is certainly both a very agreeable and a very nutritious article of food.

Whether fine oatmeal or coarse oatmeal should be used, for the making of porridge is merely a matter of taste.

The most hastily prepared and imperfectly boiled porridge is very superior to brose, yet brose is a form in which oatmeal has long been very generally used, at least in Scotland, and is still used by many of the agricultural laborers. It is made by merely pouring boiling water upon oatmeal and stirring it about. The result is a coarse, pasty mass, with numerous knots imbedded in it, of oatmeal almost raw; a very coarse kind of food, on which, however, with the addition of milk, many farm laborers mainly subsist, often using it as their only article of diet three times a day.

Oatmeal is made into bread by being merely mixed with water, kneaded, and rolled out, by a wooden roller, into thin cakes, which are baked on an iron plate (*Scottie, a girle*), suspended over a fire. Sometimes oat-cakes are made with hot water and sometimes with cold water; but those made with hot water are tougher than those made with cold water; which, if otherwise well made, are preferable. Much, however, depends on the kneading, and the question: "Is she a good baker?"—meaning a good baker of oatmeal—used to be a common one before the engagement of a domestic servant in some parts of Scotland.

Oat-cake can hardly be made too thin; the thinnest oat-cake is almost certainly the best. Oat-cake soon loses its agreeable character by imbibing water from the atmosphere; but if placed before the fire till dried, and cooled, it becomes almost as good as when newly made. With butter, or with cheese, it is a most agreeable article of food.—*Food Journal*.

WASH-HAND BASINS AND CABINET STANDS.—In fitting on the marble top, the portion at front should not be kept any broader than is necessary for strength, as it is disagreeable for the parties using the wash-stand to have to lean forward too far. In arranging the basin on the stool, the plumber ought, therefore, to see that at most the stool only projects about one-half inch beyond the outer top edge of the basin or cabinet stand. In setting cabinet stands and basins, the plumber generally uses putty, or a mixture of putty and white lead; and to make the putty adhere, the bottom of the basin is well rubbed with a softened piece of tallow, or a tallow candle, or the bottom of the basin may be heated and then rubbed over with the tallow.—*Manufacturer and Builder*.

HOW TO KEEP BUTTER COOL.—Get a large flour pot, plug up the hole with a sound cork and seal it. Now put a quarter-brick or other square, heavy body in the bottom, to serve as a support for a second, but smaller pot, which must be plugged up in the same manner. Place a dish under the outer pot, and cover with any cover you please, provided it be not metallic. Now fill the space between the inner and outer pot with water. The butter will keep as firm as a rock, as cool as a cucumber.

CLEANING LACE.—Point, or any kind of fine lace, may be cleaned easily by soaking it in a preparation of sapoline and warm water. If this is not procurable, ammonia may be used with almost equal effect. Let it soak till fit to rinse in pure warm water; then lay it on the ironing-board over clean linen, and iron lightly on the wrong side with a cool iron. Afterward pin the lace on the linen-covered board, inserting a pin in every open loop to keep the pattern clear.

A GOOD TABLE SAUCE.—Take one gallon of tomatoes, wash and simmer in three quarts of water until nearly done; strain through a sieve; add two tablespoonfuls of each of these spices, ginger, mace, black pepper, allspice and salt, and one of cayenne pepper; boil down to one quart; pour in one-half pint beet vinegar, and then pass through a hair sieve. Bottle in half-pint bottles; cork and seal securely, and keep in a cool place.

TO POLISH TINS.—First rub your tins with a dry cloth; then take dry flour and rub it on with your hands; afterwards, take an old newspaper and rub the flour off, and the tins will shine as well as if half an hour had been spent rubbing them with brick dust or powder, which spoils the handle.

FOR BLEACHING MUSLIN.—One pound of chloride of lime to forty yards of muslin; soak the muslin in soft water over night, melt the lime in a pot of water; then put the muslin in for half an hour; then rinse three times; soak in soft water over night; then hang out to dry.

FURNITURE OIL.—Mix half a pint of olive oil with one pound of soft soap. Boil them well, and apply the mixture to your oiled furniture with a piece of dry cotton wool. Polish with a soft, dry flannel.

TO CLEAN MARBLE.—To cleanse marble stained with iron rust, apply lemon-juice to it with a clean rag and wash with warm water. If soiled with dirt, wash it with soap and Paris white.

FLOOR OIL-CLOTHS.—Have the dust wiped from them often; but use soap and scrubbing-brush seldom, as they wear off the paint. Use no hot water.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Hydraulic Bearings for Shafts; Opening of the Season, 209. Preservation of Fish; Discouraging Mining Operations; The New Mining Bills; Close of the Legislature, 216. A New Method of Measuring the Velocities of Tidal and River Currents; Sweetland Creek; Dunning's Improved Pipe Coupling, 217. Patents and Inventions, 220.

ILLUSTRATIONS.—Vertical Shaft with Hydraulic Bearing; Hydraulic Bearing Propeller Shafts, 209. Lowry's Improved Current Meter; Dunning's Pipe Coupling, 217.

CORRESPONDENCE.—Mining and Mining in Plumas and Sierra; Trinity County Notes—Continued, 210.

SCIENTIFIC PROGRESS.—Friction Matches; Simplifier; Wood and Straw Paper Making in France; Thermo-Electricity in Iron Ships; The Patent Safety Blasting Powder; Engraving in Relief, 211.

MECHANICAL PROGRESS.—Iron Shipbuilding; Water Clocks; The Anglo-French Tunnel; Apparatus for Measuring Gas; Monster Engine Belts, 211.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 212.

MINING SUMMARY from various counties in California and Nevada, 212-13.

USEFUL INFORMATION.—A New Method of Staining Wood; Separation of the Mercury in Thermometer Tubes; Variegated Cotton Thread; The Corrosion of Boilers; The Detection of Blood Spots; Cleaning Glassware in the Laboratory; Adulteration of Tea, 215.

DOMESTIC ECONOMY.—Oatmeal; Washstand Basins and Cabinet Stands; How to Keep Butter Cold; Cleansing Laces; A Good Table Sauce; To Polish Tins; For Bleaching Muslin; Furniture Oil; To Clean Marble; Floor Oil-Cloths, 215.

MISCELLANEOUS.—The Yellowstone Country; Chronic Iron; Cherry Creek; Washoe Ores for the Centennial; New Mine, 210. Eureka Mines; The Consolidated Virginia; Pearline Items; White Pine Mining Outlook; Hydraulic Mining and Our Bottom Lands; Another Great Gravel Mine Opened; Pine Flat Quicksilver Mines; Finding the Latitude at Sea, 214. Separation of Gold and Silver from Lead; A Rich Strike in the K. K.; The Siberian Coal Mines; Butte Mountains—Great Mining Enterprise; San Juan; Dry Wash Machine; The Panamint Mines; Dome of the Vienna Exhibition; Lincoln Coal Mine; Mining Suit, 218. The Sutro Tunnel, 219.

Preservation of Fish.

The excellent game law drawn up by the California Acclimatizing Society was not passed by the Legislature, but on the last day of the session they passed the following law in reference to fish: It is entitled, "An Act to Amend Section 634 of the Penal Code," which, as amended, reads as follows:

Section 634. Every person who, between the first day of August and the first day of November, in each year, takes or catches any salmon, is guilty of misdemeanor. The possession of any salmon during said period shall be evidence of a violation of this section. Any person engaging, or having in possession, or offering for sale within three years from the passage of this act, shall be guilty of a misdemeanor.

Section 2. This act shall go into effect immediately.

Under this law the hatch already placed in our rivers ought to have a chance to increase in such a manner that there will be no danger of our fishermen exterminating them. Parties who have salmon in their possession must now look out as that in itself is evidence of a violation of the law.

The Kimball Manufacturing Company of this city have just finished a very handsome steam fire engine, the whole of which was made in this city.

The specimens of the State Geological Survey are being taken to the University, in accordance with a resolution of the Legislature.

The OROIMA mine, Amador county, is said to make \$6 per ton profit on \$7 rock, it only costing \$1 per ton to mine and smelt it.

New hoisting works are to be placed on the South Star mine, Washoe, for sinking a new working shaft.

BURLEIGH drills are in operation in the Gould & Curry mine, Washoe.

JOHN LAMBERT has been appointed Superintendent of the Europa mine, Washoe.

Discouraging Mining Operations.

How strange it seems that a large proportion of the population of this State should see fit to ridicule mining operations. Not only to ridicule and decry them, but to pursue the same course toward those individuals who carry on mining as a business. Because the shallow placers of California have been despoiled of their millions, and are no longer worked, this class of people argue that mining is a thing of the past. They totally ignore the vast hydraulic operations now being conducted in California; for the reason, perhaps, that they do not know anything about them. Yet, these same hydraulic mines will be worked by future generations; and will, fifty years from now, continue to pour forth a flood of gold. Not only is this class of mining held in low estimation by the ignorant, but the quartz interests of the Pacific Coast as well.

We find that the moment a mining enterprise is mentioned in the presence of many, they ridicule it at once, setting down the originator as visionary in his undertaking, or as a dishonest speculator in "wild-cat" stocks. Local itemizers and half-fed Bohemians seize with avidity upon any trifling occurrence upon which they can base a sensation article "ventilating the stupendous swindling transactions of mining corporations." In most of these articles, directors, secretaries and superintendents are handled without gloves, and represented as growing fat on assessments stolen from the pockets of gullible shareholders. All varieties of gross ridicule and caricature are indulged in, and, generally, the reader is left to infer that all mining incorporations are South Sea Bubbles—grand swindling schemes—and that most mines exist only in the imagination of the shareholders; and, furthermore, that all assessments are divided pro rata or otherwise among the sharp "insiders." These fallacious doctrines so generally incited, all have their effect on readers whose minds are not well balanced, and often prove a powerful lever in overthrowing the most beneficial of industrial enterprises.

We certainly have a right to expect that newspaper publishers, at least, should recognize the fact, that we owe our very existence, as Californians, mainly to our mines, and to discourage mining undertakings indiscriminately, is seriously ebbing our vitality. If it is their aim to encourage our people in their legitimate vocations, they should rigidly adhere to a course tending to the rapid development, rather than the retarding of our mining interests. Some of these would-be Sols talk learnedly of "fleecing the stockholders," "dishonest trustees, etc.," and publish articles advising people not to pay these assessments, (which by the way there is no law to compel them to do). It takes money to develop mines, as it does to start almost any other business; but some of these people think a mine should pay as soon as a pick is struck in it, which would be like a building paying rent when the foundation is laid. A building must be furnished before it yields an income, just as a mine must be opened before it will pay; but the difference is in favor of the mine, for something may be derived from it, however little, from the start.

Our great misfortune is, that we have in our zeal undertaken to develop more mines than we have capital to go on with. We want more capital to develop the new mines, as the old ones will take care of themselves. If assessments had not been paid where would have been the Crown Point, Belcher and many other mines, to-day? They would have been abandoned, and some of the richest ore bodies in the world would never have been brought to light. But to read some of our daily papers, Eastern and European capitalists, whose aid we require, might infer that by far the greater majority of our mines are "wild cat" speculations, and the trustees, superintendents, and presidents of the companies, a set of unscrupulous, grasping thieves, whose only business is to swindle stockholders. These charges are only made indiscriminately, and in general terms, the penny-a-liners being afraid or being unable to mention names; but the effect these foolish articles have on people who gain their information on these subjects from the newspapers is highly injurious to the State, and the whole Pacific Coast. Justice should be used at least to deserving enterprises; and, when dishonest transactions are brought to light, no class of the community will be more eager in bringing the guilty parties before the law than the people interested in mining operations.

STICKEEN.—The Collector of Customs at Victoria, informs those who contemplate a trip to the Stickeen mines, British Columbia, that no port on the Stickeen river, or on the north coast of British Columbia in connection with the Stickeen river, has yet been declared a port of entry by the Government at Ottawa, and that until orders to the contrary are issued by the Government all foreign goods intended for the mines at Dease Lake and its neighborhood, must be entered, and duty on them collected at one of the existing ports of entry in British Columbia.

COINAGE.—The coinage for March in the United States mint was: Double eagles, \$3,680,000; trade dollars, \$250,000; half dollars, \$28,000. Total, \$3,958,000. Total for nine months, including March 31, 1874, \$20,341,000.

The New Mining Bills.

The mining bills now before Congress, with all their provisions, amendments, etc., are at present in such a confused state that it is difficult to understand exactly what they are all about. But what is understood is bad enough. The debates on these bills have been lengthy and animated, and have been continued, off and on, for several weeks. The amendments offered by Holman of Indiana, and Negley of Pennsylvania, to the Mineral Patent Bill, are the most objectionable features, except Ward's bill, of which we have frequently spoken. On the 17th of last month Page reported back from the Committee of Mines and Mining, the bill which recently passed the Senate, providing that when applications have been made for patents to mineral lands, the final proof must be made within one year, or the proceedings shall be declared void, unless there is an adverse claim. The object of the bill is said to be to prevent mining companies from filing bogus applications, and keeping the land withdrawn from entry by failing to prosecute their claims.

The amendment to this bill offered by Holman is as follows, in Section 1st: "Providing that nothing herein contained shall affect or make void the proceedings for patents held by applicants for claims on mines on the Comstock lode in the State of Nevada. Nor shall it be construed so as to repeal or impair, or in any way affect the provisions of the act granting Adolph Sutro the right of way or other privileges to aid the construction of the draining or exploring tunnel to the Comstock lode in Nevada, approved July 25, 1866."

Negley's amendment, or substitute resolution, is as follows: "And provided further, that persons, companies, or corporations, owning claims or mines on said lode shall make application for patents within six months from the date of the passage of this Act; and in the absence of a bona fide advertised claim during the notice, make final proof and payment, and file a receipt for such patents, in the same manner as hereinafter provided, within six months from the date of the filing of such application; or if already filed from the date of the passage of the Act and in default thereof, or in default of filing with the Register of the Land Office at Carson City, in all cases where patents have already been issued or the acknowledgement of receipt of such patent is subject to the conditions within twenty-one days from the passage of this Act, such claims for mines shall be open to relocation by other parties in the same manner as if no location of the same had ever been made; always subject, however, to the conditions of the Sutro Tunnel Act, approved July 25, 1866."

On the first instant the House, by a vote of 96 to 116 refused to lay on the table the Mineral Patent bill with Negley's amendment. The bill, as amended, was then passed.

The Ward bill is still being discussed; not having been reported back by the Committee on Mines and Mining. Mr. Sutro has made a very strong fight in getting this amended bill passed. A large and enthusiastic meeting of citizens of Virginia City and Gold Hill, was held on the twenty-eighth, when resolutions were adopted denouncing the Negley amendment. The third resolution reads as follows:

That the passage of the amendment will destroy confidence in the mining interests of Storey county; will retard the work of development and prospecting on the Comstock lode; will discourage those by whose energies deep mining is being carried on; will drive away capital; will depress labor; will depreciate the value of real estate; will tend to annihilate business, and will, in all things, be to each of us a great and lasting calamity.

CONSOLIDATED VIRGINIA.—During last week this rapidly improving and important mine turned out 1,525 tons of ore and shipped 1,432 tons to the mills. A letter from the Superintendent, dated the 29th, says: "Sinking the shaft below the 1,400-foot level is making rapid progress. The south drift on this level is now 72 feet south from the station, and is being run direct towards the drift, now being run from the north winze on the same level. The west drift on this level is now 41 feet west from the station and has not yet reached the west vein. The drift from the winze, run to connect with the south drift from the shaft on this level, is making good progress and continues in excellent ore. The east crosscut from the winze on this level is now advanced 12 feet in fine ore. On the 1,300-foot level the work of extending the ore breaste north and south is continued. The ore in all parts continues of the same good quality. The east crosscut 100 feet north of the ore breasts, has now penetrated the ore to a distance of 32 feet. The quality of the ore disclosed in cross drift is very choice. The drift running south from the ore breaste to connect with the south winze has been extended 25 feet within the past week. The raise from the 1,300 to 1,200-foot level is completed and thoroughly ventilates the former level. The roads have improved, and two additional miles have been secured to reduce our ore."

MINING ACCIDENTS.—Last week John Stevens was caved in and instantly killed in a cut leading to a mining claim, near Angels, Calaveras county.

Martin Barry was killed in the White Rock claim, Brown's Flat, Tolueme county, by the fall of a derriok.

Close of the Legislature.

The 20th California Legislature closed its session on Monday last. Something like 2,000 bills were introduced during the session, by far the larger portion of which were either killed during their progress, or will be suffered to die in the conveniently spacious pocket of the Governor. The first half of the time was frittered away, as usual, in short sessions, long debates and frequent adjournments. As a consequence, the chief part of the business was forced into the last few weeks, and then hastily put through, and much of it too late to allow the Governor opportunity for consideration within the constitutional limits for affixing his signature. As a further consequence, the work of their preparation, whether good or bad, is lost. The Governor, however, seems determined not to allow hasty legislation to be forced upon him, and will sign such bills only as reach him in time for full and careful examination.

Our system of legislation is very faulty, in assuming much that might properly be left to the action of the several counties, in which they alone are concerned. Probably one-half of the business which comes before the Legislature could better be attended to by the various Boards of county and city Supervisors, and at a mere moiety of the cost now entailed.

If all that was desired has not been accomplished, we have, at least, the satisfaction of knowing that the session has closed without the passage of any especially injurious bills. The few tending in that direction were fortunately passed so near the close of the session that the Governor will be able to quietly kill them by simply withholding his signature. The House, generally, and the newly elected members of the Senate—those which are freest from the people—have generally stood up manfully for the right, and interposed a successful barrier against all efforts to place unjust burdens upon the State. These same, although they have introduced several important measures of reform, have yet been unable to carry them through by reason of the perverseness of a Senate which has ignored the expressed will of the people, and manifested a determination that as little should be done in the way of reform as possible.

One of the marked features of the session has been the small encouragement given to lobbyists. We trust that the severe measures adopted in one instance will be sufficient to discourage all future efforts in that direction.

The new Apportionment Bill, and the determined efforts everywhere manifested on the part of the people to free themselves from the little knots of the politicians, in the several counties, who have heretofore managed to control nominations, will undoubtedly make a pretty clean sweep of all obnoxious individuals from the next Legislature. Give us Senators and Assemblymen taken from the farm, the workshop, the counting room, with a small end carefully elected few from legal circles, and we shall have a Legislature two years hence through whose action taxes will be largely reduced, and reform measures, wherever needed, assured.

The Apportionment Act; the Fence Law; the submission to the people of the question of a Constitutional Convention; the Local Option Law, and the abolition of the extravagant City Hall Commission of San Francisco, are among the most healthy and important general measures secured during the session. The efforts to remove from the people the onerous and onerous burdens imposed upon them by an exacting railroad monopoly; the attempt to secure some general system of irrigation, and the lack of success in securing a reduction in the salaries of officers—State and local—are the marked failures. These matters, together with the passage of a few good, and some indifferent laws of general interest, and more of a local or private nature, added to the defeat of several great and small "jobs," constitute the record of the Legislature just closed—not a bad one under the circumstances.

Perhaps one of the largest "jobs" put up during this session was the scheme for the purchase of the Spring Valley Waterworks of this city. As introduced it would have robbed the city of several millions of dollars for the benefit of some half a dozen men. We read that the bill has been passed and approved by the Governor—"as amended." We have not seen the "amendment"—and therefore cannot speak with knowledge of its character; but we are fully persuaded the Governor would not have signed any bill for a water franchise purpose which failed to secure the city the fullest power to protect itself against any scheme for plundering the people.

WORKING OLD GROUND.—The superintendent of the Birdseye creek claim writes to the charet holders in London that he cleared up \$8,000 in 20 days' run from ground in the Neece & West claim that had been wholly drifted and milled by the former owners. This result is a good one, and is an earnest of what may be expected when the good ground is passed through.

At the Raymond & Ely mine they are reopening the second and third levels east of the shaft, believing that ore has been left in many places along the sides of the vein, and that much of the filling will pay to take out.

The Golden Chariot mine shipped \$14,100 on the 30th ult.

A New Method of Measuring the Velocities of Tidal and River Currents.

The facilities demanded by an increased traffic and travel on the rivers, bays and oceans within the last quarter of a century, have directed the energies of nations to the study and improvement of harbors and rivers, and the bars at their entrances. In studying shoals and bars, the mind, going from effect to cause, has been naturally led to the all-important subject of tidal and river currents. This subject has not only engaged the talents and energies of master minds, but has furnished data which are fast growing into a most instructive and useful science—that of "Physical Hydrography."

Seeing the inadequacy of the current meters now in use for furnishing data of the desired accuracy and minuteness, Mr. T. J. Lowry, of the U. S. Coast Survey, has sought to remedy it; and conceived the idea of weighing the velocities of currents by an elastic force, as that of springs. The spring used may be either a spiral spring, as we have in the spring balance, a coiled spring, a straight flat spring, or two curved flat springs, as we have in the spring dynamometer. In the form shown in the accompanying cut, a spiral spring is used; *b*, is a weighted hollow copper sphere; *a*, is a floating sphere; *d*, is a spring balance with an extra pointer, one end of which presses against a moving row of teeth, which are connected with the rod passing through the hollow of the spiral spring; and the opposite end of the pointer points out on the graduated arc the tenths, hundredths and thousandths of each division of the scale. The whole divisions of the scale moved over are shown by the small pointer, *c*. The upper one of the small copper wires connecting the spring meter, and the weighted sphere, *b*, passes over a revolving wheel, at *a*, where there is fixed a spring nipper, for the purpose of adjusting the sphere, *b*, to any required depth, as one, two, three, fathoms, etc.—the spring nipper being so connected with the boat as to be manipulated therefrom. The spring current meter is in the anchored boat with the observer.

It is obvious that with the connecting wires, as shown in the figure, that we do not get the full measure of the horizontal pressure of the current directly from observation, but in obtaining it from the observed data, we have simply a question of the resolution of a force into its horizontal and vertical components; and by very simple mechanical considerations we readily convert this weighed pressure into velocity. But if we have the wire which connects directly the meter with the sphere, *b*, passed down the anchor line, (by a traveller), to the same depth as the sphere, *b*, is sunk beneath the surface of the water, we then get directly from observation, the horizontal pressure of the current, impinging against the sphere, *b*.

Mr. Lowry made this apparatus self-registering by attaching a pencil or pen to the small pointer, *c*, so that its point will press against a revolving cylinder, or a revolving flat circular disc, covered with paper, ruled with concentric circles, the pencil moving, by the action of the spring, either parallel to the axis of the cylinder, or directly towards and from the center of the disc. The revolving cylinder or disc, is driven by a strong coiled spring and regulated by Hipp's chronograph regulator.

In making current observation the objects are three-fold; first, *velocity*; second, *epochs of slack water*; third, *direction of flow*. With the apparatus now proposed, we may weigh the velocity of a current with a delicate spring balance (the feeblest the current the more delicate the spring). This balance will also indicate most accurately the *epochs of slack water*. The *direction of the flow* is found by measuring the angle between the surface float and some determined object; the position of the anchored boat, of course, having been previously determined by angles, ranges, bearings, or distances. With this apparatus we can obviously regulate the sphere, *b*, to different depths, and get the velocity at each, without shifting the position of the boat or floating sphere, *a*; and hence, can get current observations with much more ease, expedition and accuracy, than with the apparatus ordinarily used. It will thus measure the velocity of currents at any reasonable depth, only reaching its limits where the water is so deep as to give the connecting wires an extent of surface, which, exposed to the current, may require consideration in the problem.

With the current meter which is in general use it is necessary, in order to get accurate results, that straight portions of the water-way be selected as stations; but with the meter now proposed, currents can be measured with equal accuracy in the most tortuous channels as in the straight ones. And, moreover, we get our observations of the velocities of currents at any desired point or points, and not the mean of the currents along a quarter or half-mile reach, as we do with two connected balls (one floating at the surface and the other beneath it) set adrift and followed up by a boat. And this spring meter will also be found well adapted for detecting and studying those surface and sub-surface currents and counter-currents which build in one direction—shoals, beaches and bars, whilst opening elsewhere new channels or wearing away the shores. And in studying the problem whether a bar is the result of natural forces now in operation or the effect of past conditions; whether if removed it would form again—that is, detecting its equilibrium point, if it has

any—this apparatus offers marked facilities for expedition and accuracy.

In making a composition of the currents observed simultaneously around and on a shoal or bar, if we find the results taking directions towards the shoal or bar as a focal point, the conclusion is irresistible that the sand which forms this shoal is gradually swept together from the neighboring channels. And if the shoal or bar was dredged away it would form again, for sand banks will accumulate where the resultant of the current forces is zero. And inasmuch as these conflicting currents are ever varying in their directions and velocities, it becomes all important, in order to get the exact duration and extent of each of their phases, to

LOWRY'S IMPROVED CURRENT METER.

have a continuous record of it through its varied velocities, their extent, duration and direction. For at stations where the conflicting currents are violent, the slightest error of observation, or the want of observations sufficiently frequent may, by giving false results, lead us entirely astray. But with the self-registering spring meter for currents now proposed, we avoid this liability to error, since it traces out on paper a curve which is the faithful delineation of the velocities of a current and

makes the whole length of sluices 2,694 feet. The aggregate cost of tunnel, two shafts, sluices, etc., has been \$32,799. During the year the creek returned gross \$16,262 at a total cost of \$3,200; net profits \$8,062. That portion of the creek above the slip tunnel, of about 1,600 feet in length has been a receptacle for tailings for 10 or 15 years. The basin is formed by a rock barrier or shoal of 800 feet lengths in the bed of the creek. This bar at its upper end coincides with the slip. This ob-

DUNNING'S PIPE COUPLING.

their duration through its varied and ever varying phases. Thus we have the whole curve and not a series of points in it (with the intermediate ones to be interpolated by guess) as we have in the apparatus now in general use. With this spring meter we can get accurate measures of sub-surface currents even on very windy days; and since it gives continuous readings of the currents, it better enables us to study the effects of winds and freshets on them. What appeared before a tangled skein of disconnected and discordant facts, will, by using an instrument of this character, arrange themselves into harmonious wholes, the laws of the currents be unveiled, and the engineer enabled to project his improvements with a firm confidence of their success. Mr. Lowry, who is now stationed in this city, has devised several other forms of this instrument; but mechanical details are of minor importance, the main idea being to weigh the velocity of currents by an elastic force, as that of springs. The velocity of a current may be also weighed by balancing it against the force of gravity.

SMELTERS AT WORK.—Nearly all the smelters about Salt Lake, who closed down their establishments during the winter, are about starting up again.

Sweetland Creek.

The annual report of the Superintendent of the company, published in our late London Exchange indicates that from recent surveys the rich channel of ground will last at least, double the time anticipated. After a run of 5t days a clean up of \$25,000 was made of which \$14,000 was net profit, a satisfactory result for the first run of the season. During the year the new tunnel was run 355 feet, and a shaft 75 feet deep raised to the surface. The tunnel sluices have been extended 664 feet making the whole length of tunnel sluices at 2,724 feet, and 280 feet of outside extension added to this

of the Milton Water company not having been completed, the water supply of the company fell short, even when it lasted and the seam was cut short for months by the entire absence of water for that length of time. The superintendent expects a continuous supply of water this year. The full complement of water is 1,500 inches; whereas, last year when running they only used 800 inches, the profits were reduced. Considering that the dead work of the creek is at an end, and that the tunnel is to be driven only from one face, will lessen materially the profitless labor of the mine. Should the water supply hold out and the quality of gravel remain unchanged, they expect larger returns and profits this year. We most earnestly hope that all the expectations of our English friends will be realized.

Dunning's Improved Pipe Coupling.

This invention, perspective and sectional views of which are represented in the annexed engraving, is claimed to provide a simple and cheap union or coupling for gas, steam, and water tubes, which may be applied even in long lengths of continuous straight pipe. It will also serve as a sliding or compensating joint to allow for contraction and expansion, and will, besides, prove useful when it is desirable to connect the ends of pipe in situations where threads cannot be conveniently cut thereon.

A, is a conical sleeve, cut from end to end, as represented in Fig. 1, or if desired, divided longitudinally into two separate portions. It is bored out somewhat larger toward the center, so as to insure a bearing at the ends around the pipe when closed by the collars, *B* *C*, which are also bored to correspond with the conical shape of the sleeve. The collar, *B*, is flanged to receive the threaded coupling ring, *D*, to which it is swiveled as indicated in the sectional view. Collar, *C*, is provided with a thread upon which the ring screws. The joint between the ends of the pipe is thoroughly packed by a section of rubber, *E*, or other suitable tubular packing.

To adjust the device, the extremities of the tube are thrown out of line, and the sleeve, *A*, containing the packing, *E*, and upon which the collars and ring have been placed, is applied to one end. The pipe is brought in line, and the rubber tube, with the other portions, is brought over the joint so as to overlap the two extremities equally. The ring, *D*, is then screwed up, drawing the two collars together upon the inclined surfaces of the conical sleeve, thereby compressing it firmly against the packing.

This coupling can be manufactured very cheaply of malleable iron, as all the parts can be cast of the necessary form and size for different pipes, and require no finishing or fitting except cutting the screw. It is claimed to cost no more than the ordinary union coupling, except the expense of the pliable hose for the packing. It makes a perfect slip joint as well as a good coupling, and will be found very useful for plumbers in repairing split pipe in places where a die cannot be used to cut threads on the pipes, or where the latter are close to the walls or among joists in buildings.

For further particulars address the inventor, Wm. B. Dunning, New York Central Iron Works, Geneva, New York.

MINING PATENTS.—Commissioner Drummond recently received a letter from Gray & Haven, of San Francisco, asking whether the Department would permit parties who own several mining claims adjoining each other, to make one application for a patent to all the lands in one tract, instead of separate applications. He has responded officially, that in all such cases, each claim must be separately surveyed, notices posted on each tract, and record proved separately. Also, it must be shown that five hundred dollars have been expended on each claim. Then, if the claims are adjoining, one application for a patent may be made to cover the whole tract. But this will not be granted when the claims are remote from each other, the only object being to allow patents to issue with as little cost as possible.

"MINERAL KING" DISTRICT.—The new mining district in Tulare county, called the "Mineral King," has been exciting considerable attention of late. A company has been organized and is now building a road from Visalia to the new mines, which lie (as near as can be ascertained) at the base of Mt. Whitney. The mines are about 45 miles from Visalia, as the pack road lies, which has been completed to within 5 miles of the claims. It is utterly impossible to reach the mines at present, on account of the snow, which lies on the mountains from 15 to 20 feet deep, and will continue to do so, for two months to come. From all accounts the mines are very rich and will yield well, as some of the ore which has been assayed in San Francisco, went as high as \$500 to the ton.

While excavating for the foundation of his new mill at Benton, Nevada, A. B. Williams unearthed three bars of bullion, weighing in the aggregate nearly three hundred pounds. It is supposed that it had been stolen.

The recent reduction in price of water used in the American gravel mine, near San Juan, Nevada county, from 16½ to 8 cents an inch, is said to save that company not less than \$150,000 a year.

Separation of Gold and Silver From Lead.

But little is known, to those not engaged in the business, of the methods employed in this country for separating gold and silver from impure lead; and we believe the following facts, gathered by our reporters, will be found of interest.

Two grades of impure lead are exported from Utah to the Eastern States for refining. The impurities are gold and silver, which communicate a superior hardness to the lead, and also increase its fusibility. These ingredients, however, do not exist in sufficient proportion to warrant the application of the cupel process, or rather the loss of lead would be so great as to make the operation too expensive. The lowest grade contains 80 ounces of silver and 1 of gold to the ton; the other grade known as the R. C. M. bullion contains 120 ounces of silver and four of gold per ton of bullion. Besides these components, certain proportions of antimony and occasionally a trace of arsenic enter into the composition of the bullion.

The bullion is first placed in kettles and melted to refine it. In this process the dross, which rises to the surface of the metal during the melting, contains the greater part of the impurities, such as antimony, bismuth, etc. This dross is afterwards refined separately in an appropriate furnace. This having been removed the melted metal is drawn off into a larger kettle. It is thence removed to other kettles, and a certain proportion of zinc added, the quantity bearing a fixed ratio to the quantity of silver already in the metal. In the working of each sample of bullion a preliminary assay is necessary to determine the proportion of silver.

When the metal is melted with the zinc, a slow fire is employed; and as the process goes on, an alloy of silver and zinc rises to the surface. The latter is skimmed off and placed in a plumbago crucible, provided with a neck similar to a retort. The crucible is then placed in one of Du Faur's furnaces, which is so arranged that it can be tilted by the aid of a wheel attached to the furnace. The zinc is here distilled off, and condenses in the tube or neck which is attached to the crucible. A part of the zinc is driven off as oxide, and this is lost, but about two-thirds of it sublimes in the neck of the crucible. When the tube is removed, the zinc is withdrawn therefrom, and used in a similar operation. It will be remembered that silver melts at about the same temperature at which zinc is volatilized. The metal remaining in the crucible consists of gold, silver and lead, the latter in small quantity. This having been withdrawn the precious metals are separated from the lead by cupellation. The resulting gold and silver are then run into ingots, and the silver removed by nitric acid, or by whatever method may be most convenient. In this mixture of gold and silver, gold forms from one-half to one and a half per cent. Some idea of the magnitude of the operation may be formed from the following facts regarding a large establishment. They claim a weekly production of silver of about 12,000 ounces, and a proportionate quantity of lead. Generally the process returns about 89 per cent. of the lead which was in the bullion at the commencement of the operation. They use cast iron kettles in the process of separating the silver from the lead by the aid of zinc, each capable of holding two tons of bullion. Twelve of Du Faur's tilting furnaces are used, each capable holding about 250 pounds of metal. Four refining furnaces are used, two capable of a charge of six tons each, one of twelve tons and one of sixteen tons. *Salt Lake Tribune.*

A RICH STRIKE IN THE K. K.—We are pleased to be able to chronicle a really remarkable strike in the second level of the K. K. mine. At a depth of 154 feet, beneath the revine, and a little northeast of the old Mercedina shaft, there is found an exceedingly large mass of low grade ore, the sure precursor and indicator of pay ore. Through this vein matter the drift was pushed, and on Saturday last pay ore was struck. Up to date the level has been driven steadily forward, through the ore, a distance of 40 feet, and the hanging wall has not yet been reached. Of this 40 feet of ore, more than half, is first-class, yellow, gray, and black carbonates, and the remainder good second-class ore. It is the intention of the manager to continue the present drift until the true width of the new body is shown, and then to sink a winze to connect with the third regular gallery, which has already been started. The body recently struck is, doubtless, the continuation of the main Mercedina ore shoot, which can be followed back to the first level, a distance of more than 100 feet on the incline. The great widening of the ore is first made apparent at the second level; and, should the present body hold out, which all indications warrant us in believing, the K. K. company will have need of all the furnaces it can construct during the coming summer. This strike is a matter of congratulation, not only for the stockholders of the company, but also for the whole district, as furnishing still another proof, if such be necessary, not only of the large amount of ore in our mines, but of their permanence and growing wealth as the depth of the mines advances. —*Eureka Sentinel.*

Plumas County Indians are making money by packing provisions to the miners living in the creeks and camps where there is no road open.

The Sibirian Coal Mines.

A company was recently formed in this city, for the purpose of working some coal mining property in Ignacio valley, Walnut creek, Contra Costa county, about four miles from Pacheco. The company, known as the Sibirian Coal Mining Company, has a reported stock of \$3,000,000, divided into 60,000 shares. This company proposes that, to parties purchasing ten shares of stock, it will furnish coal from their mine at a reduction of 20 per cent. from the current wholesale prices in this city. Mr. Henry Degroot, who made an examination of the company's property, speaks in his report as follows concerning the geological formation: The rock in the vicinity of the company's ground consists chiefly of heavy masses of gray sandstone, in which occur numerous seams of carboniferous matter. Some of these seams are very thin, while others are of considerable size, the whole of them being accompanied with fire-clay, pipe-clay, bituminous shale and slate. Belts of limestone and a gritty conglomerate rock also make their appearance in the neighborhood, these latter being very often constituent parts of the true coal measures. The sandstone here makes its appearance above ground in many places, an enormous reef of this material crowning the ridge that overlooks Ignacio valley, and along which it can be traced by the eye for several miles.

The sandstone in the vicinity of the company's exploratory works seems to be permeated with carboniferous veins of various dimensions. Some of them being mere streaks, scarcely more than discoloring the formation in which they are embedded, while others show a thickness at the lowest points to which they have been exposed for nearly two feet. Along the course of the tunnel, run in for a distance of more than 100 feet, a great many of these minute veins have been intersected, while the stratum on which the principal shaft has been put down is fully 18 inches wide at a point 30 feet below the surface. It stands nearly vertical, and though not over eight inches wide on top, is found to gradually expand till it reaches the above dimensions at the lowest point to which it has yet been laid open. In a second shaft, sunk a few hundred yards to the southeast, and further up the ridge, a still thicker but less concentrated body of coal has been developed on about the same level as that below. The first seam spoken of is very compact, displaying a continuous sheet of solid coal to a depth of 26 feet, the top of it having been covered over with about four feet of alluvium. Slight excavations at several other localities in the neighborhood, reveal small veins; stringers and like indications of carboniferous deposits, the sandstone, shale and similar evidences of true coal measures being everywhere present.

This coal is a species of lignite, which presents the same general characteristics as that of Mount Diablo. It contains few impurities, and ignites easily. According to analysis by Dr. O. A. Henry, it carries about 45 per cent. of fixed carbon, 35 per cent. of volatile matter, and 25 per cent. of water and ash.

Butte Mountain--Great Mining Enterprise.

Of the numerous enterprises to be prosecuted in this section of the State the present season for the development of our vast mineral resources, says the *Calaveras Chronicle*, the prospecting of Butte Mountain by tunneling, stands prominent in importance. A short time since Mr. George Kelton, in conjunction with a company of capitalists of San Francisco, located an extensive claim on the east side of the mountain at its base, about midway between its north and south extremities. A cut for the purpose of starting the tunnel is nearly completed, and when finished, a force of hands sufficient to keep the work in constant progress, both day and night, till the results of the prospecting are attained, will be employed. All the ravines and flats immediately surrounding the mountain, were among the most remunerative of our early worked placer mines, paying well close up to the farthest point that could be mined by sluicing from the ditch which encircles the base of the mountain. On all sides of this great "lead-mark" tunnels have been run and shafts sunk for the purpose of prospecting, and in nearly every instance gold in sufficient quantities obtained to justify more extensive developments. By the limited means already employed in prospecting the base, it has been ascertained that a basin of considerable dimensions lies underneath the mountain; that its rim, on either side, is quite extensive in height, and from every inclining point prospecting, a bed of gravel, with more or less gold, set in, which in many places has proved to be immensely rich, and which has been followed into the basin as far as the miners could possibly operate, in consequence of the great quantity of water met to contend with. The system of prospecting this important locality, as designed by Mr. Kelton—who is the superintendent of the enterprise—is to penetrate the rim at a low point, and then if the tunnel is not sufficiently low to drain the basin, erect the necessary machinery to fathom its bottom, and consummate the work of prospecting. Mr. Kelton's plan seems to be the only real practical method of successfully testing the mineral wealth of the mountain.

The Pactols gold mine near Smartsville is yielding \$800 per day.

San Juan.

The *White Pine News* has had the opportunity of perusing two letters from San Juan; one addressed to J. McManus and the other to Wiederhold and Hoag. The tone of these two letters regarding the merits of the San Juan country differs in this, that one condemns it entirely, the other says nothing in its favor. One says that there are more broke men than he ever saw at one place. The other says he shall get away if he can make a raise. The upshot of the matter is that Pöchers would do well to stay at home and make the best of dull times, rather than go to a country where they are worse off. We append some extracts from both of the letters:

TERRA AMARILLA, N. M., March 1, 1874.

We have now two feet of snow here; but the weather has cleared up, and it is quite warm and I think the snow will soon disappear. Forty miles south of this there is no snow, and has not been during the winter to lay on any length of time. A new county has been established by the Legislature of Colorado, embracing the whole of the San Juan mining county, called Laplata, and the county seat is fixed at a town called Howardsville, situated in Baker's Park near the mines. So this, in my opinion, lets out Animas or Albert City in the Animas valley, and Howardsville will be the place. The location is up in the mountains, and the site is said to be a beautiful one.

The officers of the new county have all been appointed by Governor Elbert, and the county will be organized as soon as the snow will admit of the officials getting there.

It is hard to tell where the travel will concentrate. Pueblo is striving hard for the spring trade and travel. Denver is making an effort, and Santa Fe is working for the Terre Amarilla route. I think the early spring travel will be over the latter route, as it is the most southern, and prospectors will be able to get into the mines at least a month earlier than by any other route.

DEL NORTE, February 26, 1874.

DEAR FRIEND:—This is the most poverty stricken country that ever I got into. The stock is dying with starvation. It has been snowing here the last four days without any stopping to it. This country is no good for a poor miner, where there is up at the mines at least 11 feet of snow now. I have never seen any country where a man can see as many broken men as there are in this Territory. You had better stay where you are. I expect to get back as soon as I can make the rifle. I'd sooner be in Minnesota at once than be in any such country as this. It is actually not worth ten cents to ten square miles.

Dry Wash Machine.

Mr. Le Niece, of this town, has invented and constructed an important mechanical contrivance, which he dubs by the suggestive name of a "Dry Wash Machine." The machine is composed of a hopper, a cylinder about three feet in length, two feet in diameter in the end next to the hopper, and three feet in diameter on the outside end; a screen about one foot below the cylinder; a table about a foot beneath the screen; a trough suspended to and beneath the table, and a fan behind and attached to the table. The placer dirt is put into the hopper, from which it is passed to the cylinder. The cylinder being smaller at the inside end than the outside, "throws its own refuse," or in other words, the coarse dirt all passes from it to the ground, the fine dirt, containing the precious "sand," falls on the screen, which is kept constantly in motion, thus helping the gold to free itself; from the screen the fine dirt falls on the table, also continually in motion, and from the table it is passed into the trough containing the quicksilver. During this sifting process, the fan is kept continually turning in such a manner that it blows a current of air constantly across the table towards the trough, thus blowing even the slightest particles of dust into the trough and quicksilver.

The machine is about six feet high, four feet long, and weighs about one hundred and fifty pounds. It can be taken apart and packed in a small compass, inside of five minutes. Of course, as its name indicates, it is intended to use in dry placer mines, where water cannot be procured. If the invention works according to the expectations formed of it, it will certainly enrich its ingenious originator. We hope it will. —*San Bernardino Guardian.*

THE PANAMINT MINES.—The *Inyo Independent* says: We have in our possession a specimen of Panamint chloride ore which is certainly as rich as anything of the kind we have yet seen. This specimen is out of a three-foot ledge, all of the same general quality; the name of the mine we did not learn. This ledge is opened to a depth of about twenty feet. "The Wonder of the World" is down sixty feet or thereabouts, and the developments in these and numerous others in the camp are said to be as flattering as any men could wish for. The ores evidently contain a heavy percentage of copper and other base metals, and will require scientific manipulation to insure satisfactory results, notwithstanding the fact that the actual assay value of very large quantities of them is away up in the thousands. Panamint is undoubtedly one of the most promising camps of the day. Its population at present is only about seventy, but we would not be in the least surprised if this number was increased to several thousand within one or two years at the most. No district apparently had a greater future before it.

Dome of the Vienna Exhibition.

A few weeks ago, Mr. J. Scott Russell, C. E., read a paper at the Royal Institute of British Architects, "On the Central Dome of the Vienna Exhibition Building." After a few opening remarks, in which the lecturer explored the general principles of public works executed by engineers, and expressed his hopes that the rising generation of architects and engineers would derive mutual advantage by an interchange of special studies, and by a closer alliance of their individual professions, Mr. Russell proceeded to describe in detail, the curious and interesting structure which formed the subject of his paper. The iron dome, or rather cone, at Vienna, may fairly claim to be the largest vaulted roof in the world. It occupies nine times the superficial area covered by the dome of St. Paul's, eight times that of St. Peter's, at Rome, and seven times that of the dome of St. Sophia, at Constantinople; in other words, it is no less than 360 feet in diameter, and 1,080 feet in circumference. It is carried on 30 columns, erected at intervals of 36 feet all round. The cone is raised at an angle of 30 degs., the length of the slope on all sides being 200 feet. The roof is formed of 360 iron plates, tapering uniformly upwards from the circumference to the apex of the cone. These are riveted like the plates of a ship, each row of plates covering one degree of the circle, and each bottom-plate being one yard wide between the lines of rivets. The conical roof thus constructed has no visible external wall, but is surrounded by a circular building, which may be described as the central nave of the Exhibition, carried round under the outer circumference of the dome. The roof, therefore, as seen from outside, crowns the large low buildings by which it is surrounded, and seems to grow out of them. Passing on to the mechanical principles of conic dome structures in iron, Mr. Russell proceeded to describe the nature of the material and the various modes of its application, giving statistics as to the strength of iron, under tensile and compressive forces, respectively. From these he argued that the conic form in certain proportions makes the cheapest and strongest roof on the largest possible scale, consisting as it does of the minimum of material disposed in the most advantageous way. In dealing with this portion of his subject, the lecturer caused some amusement by boldly questioning the advantage of employing girders and roof trusses of the most usual and accepted forms, alleging that they were "mere modifications of ingenious waste," whereas every atom of iron in the Vienna roof did its own work without counteraction, disagreement, or redundant strength. Mr. Russell then gave a mathematical analysis of the method on which the dome was constructed, describing how and why he had eliminated from its design every particle of superabundant material. He recounted the various accidents which might have effected its stability, and showed how he had provided against them, declaring that the cone would stand after it had been pierced through all over, even supposing its outer and inner rings cut through and the outer chain of the cone itself severed. He expressed his belief that only complete disintegration could bring it down, and that it would cost more time and labor to destroy than to construct it.

LINCOLN COAL MINE.—The *Grease Valley Union* gets from Mr. Thomas Paterson, of that place, some facts about the Lincoln coal mine. Mr. Paterson is an old coal miner, having worked for years in the coal mines of England, and is a good judge of such things. He pronounces the Lincoln article to be "lignite." It is similar to the Rocky Mountain coal, but is not quite so hard. The greater age of the Rocky Mountain article gives the greater hardness. The surface of the Lincoln coal is about 58 feet deep, and the thickness of the layer is about 9 feet, perpendicular. The horizontal thickness of the deposit is not yet known. Both above and below the deposit are beds of sand—the coal being sandwiched between layers of sand. This Lincoln coal, when dry, makes a splendid fuel. One ton of it is equal in heating capacity to about one cord and a half of good pine wood. It is coating now about \$2.50 a ton to mine and hoist the coal to the surface. This expense will soon be lessened. The company have now about 500 tons of the coal on the surface of the ground. The Lincoln coal mine promises not only to be a paying institution to its owners, but also a great advantage to the industries of those portions of the State which can be reached by railroads or navigable water. Messrs. James & English, blacksmiths, after a practical trial of the coal, are of the opinion that it may do well in a forge, for the working of iron. They will soon give it a more thorough test, and enough of the article has been ordered for the trial.

MINING SUIT.—David W. Gillet has instituted suit against the Keystone Consolidated Mining Company of Amador, in the Twelfth District Court, and for cause of action alleges that he was the owner, under a State grant, of the land on which the company is mining, and that the company in March, 1872, entered upon the land and ejected the plaintiff therefrom and began mining thereon. He alleges that from March 27th, 1872, until March 26th, 1874, the company extracted gold-bearing quartz from which \$288,000 in gold have been extracted, and are still taking out large quantities of auriferous rock. He asks for a decree declaring him the owner of the property and for \$500,000.

The Sutro Tunnel.

Yesterday, in company with Mr. R. S. Raw, says the Gold Hill News, we made a trip over the line of the Satro tunnel. Considerable snow was encountered on the west end of the line, but on the eastern slope of the mountain the road was dry and dusty. From the summit of the mountain the out-look to the eastward is magnificently grand. At our feet lay the town of Satro, its streets laid out with mathematical exactness, the whole wearing a look of dreamy repose. In the distance the Carson river was discernible, its grass covered banks being lined with stately cottonwoods. No work is being done at present at shafts Nos. 3 and 4.

At Shaft No. 2

The work of sinking is progressing at the rate of from 20 to 25 feet per week. The shaft has already attained a depth of 985 feet, and only 60 feet more will have to be sunk in order to reach the tunnel level. Considerable water has been encountered in the shaft during the present week, but the pumps have been able to handle it. It is expected that the work of sinking this shaft to the level of the tunnel will be completed in about three weeks. A gigantic air compressor for this shaft was recently shipped by steamer from Kalk, Belgium, and will shortly arrive in San Francisco. It will be used in driving Burleigh drills. The work of tunneling from this shaft will be carried forward in an easterly and westerly direction.

Shaft No. 1.

At shaft No. 1 we met our old-time friend, Mr. J. B. Pitchford, a very companionable gentleman and a splendid mechanic. He had just completed the task of placing in position one of the largest and most powerful donkey-air compressing engines on the coast. It was manufactured by J. C. Cockerell & Co., Belgium. The entire weight of the machine is 98,000 pounds. The bed-plate is 36 feet in length; diameter of cylinders, 18 inches, with four-foot stroke. While we were at the shaft Mr. Pitchford got up steam, and set the huge cyclopaean affair in motion. It was evident even to our unmechanical eye that the "compressor" possesses a vast amount of energy. It will be used in widening out the tunnel and in driving Burleigh drills, twenty of which will shortly be placed in operation. The "compressor," which is stationed at the surface of shaft No. 1, 500 feet above the tunnel level, is possessed of sufficient power to drive the Burleigh drills when working a mile away. At present the header is advancing at the rate of about 120 ft. a month. The header is in a distance of 5,760 feet, or 900 feet past shaft No. 1, and is in hard rock.

Miscellaneous.

The number of men in the employ of the company is over 100. The work of running the tunnel is being carried on under the management of the following named officers: Superintendent, F. A. Benjamin; Foreman in charge of header, A. B. Jackson; Master Mechanic, J. B. Pitchford; Chief Accountant, J. R. Johnson; Paymaster, D. J. Bonfield; Surveyor, A. D. Foote; Foreman at shaft No. 2, J. C. Blunt; Post Surgeon, Doctor M. McPherson. After a short stay at shaft No. 1, we proceeded to the mouth of the tunnel, where we had the pleasure of meeting Mr. Benjamin, Superintendent of the company, and a half-dozen other gentlemen employed in some official capacity. Mr. Benjamin is a genial, whole-souled gentleman, possessing a large amount of vim and an abiding faith in the success of the tunnel enterprise. While at the mouth of the tunnel we took a stroll through the machine shop, which is fitted up with a fine lot of machinery. On the floor of the shop we noticed a couple of the celebrated Burleigh drilling machines. They are somewhat complicated, being composed of at least 150 pieces each, but are more effective than any of the battering rams of the ancients, and prove to be powerful auxiliaries in promoting mining enterprises.

Town of Sutro,

As already stated, presents a very quiet appearance. In company with Messrs. Ross E. Browne, Johnson, Foote and McPherson, we partook of an enjoyable meal at a restaurant kept by a lady whose name we do not remember. A school will be shortly organized in Sutro, with 30 pupils in attendance. An effort was made some time since, by Rev. J. Rawson Johnson, to found a church in the town, though he met with indifferent success. On a certain evening in which services were to be held, an eccentric individual called "Saul" went around the town and tried to drum up an audience by ringing a cow bell. After the audience had assembled, "Saul" changed his mind and refused to allow the services to go on.

Geological.

Carson Valley, in the vicinity of the town of Sutro, was originally an inland sea or lake. The soil is composed of the products resulting from the decomposition of the characteristic rock east of the Comstock, such as trachyte and greenstone. Three different river beds are distinguishable. Several varieties of water-shells are to be found in the valley, and in the foothills well defined water marks are apparent to the most careless observer.

Sutterley's Mine.

About 1½ miles north of Sutro, in August, 1873, J. K. Satterley discovered and located a mine on the edge of the valley, the ore taken from which was said to assay as high as \$9,000.

Sutterley located his mine on a large boulder, which, from its rounded appearance, must have rolled at least a mile. The owner of the mine piled up a row of rock on the south side of his claim as a boundary line, and another party, mistaking the same for croppings, located thereon an extension of 3,000 feet with all the dips, angles, spurs and sinuosities.

LABORING men can find steady employment in the quartz mines near Placerville.

Don't Have Your Teeth Extracted.

DR. BEERS' PATENT ENEAMELED GOLD CROWNS, for Covering Teeth broken down by Decay, have been thoroughly tested, and when properly applied will surely restore them again to usefulness and beauty. Call and see them. Office, 230 Kearny street. 6v7-eow-hp-3m

WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere.

(Continued from Page 213.)

YELLOW JACKET.—Sinking the main incline below the 1,540-ft. level is making the usual good progress.

FLORIDA.—Some excellent and very promising quartz has been passed through by the winze below the north drift, which gives very encouraging assays.

TYLER.—Sinking the main shaft is progressing at the rate of two feet per day, the rock in the bottom blasting bad.

WOODVILLE.—Still driving the north drift on the 300-ft. level, following the hanging wall with favorable indications of the development of a more permanent body of ore.

UNION CONSOLIDATED.—The north drift on the 1,300-ft. level of the Ophir is being pushed rapidly ahead toward the south line of the Consolidated in very favorable-looking ground.

SEGREGATED ROCK ISLAND.—A crosscut east has been started from the main north drift, which shows some very favorable prospects.

MINT.—The hoisting works building is about completed, the engine in place and everything in readiness to soon resume sinking the shaft.

MONTZUMA.—Sinking the shaft is making the usual progress.

ALPHA.—Still driving the north drift on the 1,500-ft. level, cutting occasional spots and streaks of ore.

ROCK ISLAND.—Sinking the shaft is making steady progress.

ELY DISTRICT.
RAYMOND AND ELY.—Picche Record, March 21: Sinking has been suspended on the main shaft. A station has been opened at the 1,200-ft. level. On the 1,000-ft. level they find some good ore on the foot-wall. On the 7th and 8th levels stoping is going on, and from 30 to 40 tons of ore is taken out per day. The mine is in excellent condition.

MEADOW VALLEY.—At No. 3 works the shaft has attained a vertical depth of 1,201 feet from the surface. From the 11th station drifts were being run east and west. From the 6th station a level has been run, showing a strong vein of quartz, but little ore. As this is intended for the main working shaft of the company's ground, more attention is being paid to sinking it as rapidly as possible than anything else. The mills of the company keep at work, realizing a fair amount of bullion.

PORTLAND.—The prospects of this mine are, if anything, improving. The anticipations caused by the discovery of a ledge of high grade ore, heretofore reported, are being realized. The winze being sunk from the 180-ft. level continues to show abundance of very rich ore. Some considerable amount of ore has already been taken out. The superintendent expects to commence sending ore to the mills on the 1st prox.

PROCHE.—The work is principally confined to sinking the new main shaft and opening a drift therefrom for connection with the old workings.

PAGE AND PANACA.—The prospects of this mine have improved very much in the past few days. The latest development was made in the 600-ft. level, 286 ft. west of winze No. 1, and assays up in the hundreds. The ore is a beautiful chloride, with streaks of galena. The company are building a new ore-house, and the railroad company are extending their track to the same.

PEAVINE.—The winze between the third and fourth levels is being sunk. Some little ore is being extracted.

ALPS.—The shaft has reached a depth of 380 ft. and still progressing.

WASHINGTON AND CREOLE.—The shaft on the Mazappa ground is now 620 ft. deep, and connection will be made with the drift of Washington and Creole about the middle of the following week. Ore is being found and extracted daily to the amount of five or six tons.

CHIEF OF THE HILL.—Three drifts are being driven on the ledge, the deepest of which starts at a point 600 feet from the surface. Some ore is being taken out daily, and the usual force is employed.

INCOMAR.—The shaft is 583 feet deep, and the drift running southwesterly is now 480 ft. in length.

BOVERY.—The shaft is now down 520 ft., and the principal drift 135 ft. in length. The mine shows very good indications of soon reaching an ore body; but progress is very slow, as the rock is extremely hard.

AMERICAN FLAO.—The mine looks well, and there is every prospect of still greater improvement.

PACIFIC TUNNEL.—From Mr. Nichols we learn that work on this important undertaking is likely to be very soon resumed.

The gravel deposit in Nugget Ravine, near Silver City, Nevada, which is worked by means of sluices, is paying, according to the Gold Hill News, from \$6 to \$10 per day, to the hand. The gold is worth about \$12 per ounce, containing considerable silver.

The expenditures made in running a mining tunnel, before a lode is struck in the tunnel, is not considered by the Land Office as equivalent to expenditures on the lode. Tunnel owners will hear this fact in mind, and act accordingly.

BOOTH & CO. of the Union Iron works, in this city, have lately turned out two passenger locomotives, 30 tons each, for the San Francisco and North Pacific Railroad.

In procuring patents for horax deposits, the same proceedings are requisite as in the case of applications for patents for placer mines.

BRASS LOCKS.—A large amount of money has annually been sent East for brass locks and other kinds of brass goods. The day, we trust, is fast approaching, if it has not already come, when this source of drain upon our resources will be dried up. Whenever an article can be manufactured here, equal in quality and price to the imported, merchants and consumers will naturally purchase at home, not only from a desire to encourage home industry and employment of labor, but from the most universal and, perhaps, strongest of motives—that of self-interest. We are, therefore, always pleased to learn of the establishment of any branch of manufactures that can successfully compete with Eastern or foreign markets. Messrs. Adams, Springer & Co., of the Pacific Brass Foundry, recently opened, at No. 20 Fremont street, in this city, assure us that they can supply the trade with a good article in the way of brass padlocks, ship locks, and brass locks and goods of different kinds, on as favorable terms as laid down by Sargent & Greenleaf, Barnes & Dietz, and other Eastern houses:

TINTIC DISTRICT, Utah, is said to be looking up again, now that spring has come. Favorable reports are received concerning the mines in the district.

LAST week the Little Cottonwood mines, Utah, shipped as follows: Flagstaff, 350 tons; Emma, 30 tons; McKay 20 tons; and Vallejo, 20 tons.

PAIN-KILLER.

1840.

1874.

Time Tests the Merits of All Things.

THIRTY YEARS is certainly long enough time to prove the efficacy of any medicine, and that the Pain-Killer is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a sure and effective remedy. It is sold in almost every country in the world, and it needs only to be known to be prized, and its reputation as a Medicine of Great Virtue, is fully and permanently established. It is the great Family Medicine of the age. Taken internally, it cures Dysentery, Cholera, Diarrhea, Cramp and Pain in the Stomach, Bowel Complaint, Painters' Colic, Liver Complaint, Dyspepsia, or Indigestion, Sudden Colds, Sore Throat and Coughs. Taken externally, it cures Bruises, Boils, Felons, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost Bitten Feet, etc.

Pain is supposed to be the lot of us poor mortals, as inevitable as death, and liable at any time to come upon us. Therefore, it is important that remedial agents should be at hand to be used on emergency, when we are made to feel the excruciating agony of pain, or the depressing influences of disease. Such a remedial exists in Perry Davis' "Pain-Killer," the fame of which has extended over all the earth. Amid the eternal ices of the Polar regions, or beneath the intolerable and burning sun of the tropics, its virtues are known and appreciated. And by its suffering humanity has found relief from many of its ills. The effect of the Pain-Killer upon the patient, when taken internally in cases of Cough, Cold, Bowel Complaint, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores and Sprains, Cuts, Stings of Insects, etc., and other causes of suffering, has secured for it the most prominent position among the medicines of the day. Beware of counterfeits and worthless imitations. Call for Perry Davis' Vegetable Pain-Killer, and take no other.

Sold by Druggists and Grocers.

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the **MINING AND SCIENTIFIC PRESS**, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

LEATHER.

WEDNESDAY M., April 1, 1874.

The Leather market is about in the same unsatisfactory condition as previously reported. Local brands are very slow of sale, and the only business done appears to be in imported goods.

Mining and Other Companies.

Going to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Benjamin Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate District, Lyon county, Nevada.
Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 401 California street, San Francisco, Cal.
Any stock upon which this assessment shall remain unpaid on the 25th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the 15th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Directors,
LEANDER LEAVITT, Secretary.
Office—Room 7, No. 401 California street, San Francisco, Cal. m14-4w

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 25th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Directors,
F. N. WELLS, Secretary.
Office—No. 402 Montgomery street, Room No. 23, San Francisco, Cal. m14-4w

Commercial Coal Mining Company of San Francisco.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of 2 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 25th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Directors,
S. B. HANSON, Secretary.
Office—No. 402 Montgomery street, Room No. 23, San Francisco, California. m14-4w

Grand Central Quicksilver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Ginnabar Mining District, Sonoma County, California.
Notice to STOCKHOLDERS.—A meeting of the stockholders of the above named company will be held at the office of the company in San Francisco, on Wednesday, the 15th day of April, 1874, at 12:30 P. M., for the purpose of adopting By-Laws for the company, and such other business as may be brought before the company. By order of the Board of Directors,
A. C. WAITT, Secretary.
Office of the company, 201 Front street, San Francisco, Cal. m14-4w

Geneva Consolidated Silver Mining Company.

Location of principal place of business, City and County of San Francisco, State of California.

Location of works, Cherry Creek Mining District, White Pine County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth (10th) day of February, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

CAST STEEL SHOE AND DIE COMPANY,

OFFICE—Room 28, Hayward's Building, 419 California St., S. F.

Patented CAST STEEL SHOES & DIES for Quartz Mills.

Price, 20 cents per Pound.

An improvement greatly needed—being Stronger, more Durable and Economical than Cast Iron; as the Dies, when worn down, can be welded to the Shoes as easily as bar steel; never break, keep their full striking surface. Battery of five shoes crushes one-ton more ore in 24 hours than Cast Iron Shoes, will wear as long as four set of Cast Iron Shoes, and can be worn down to 1/2 inch in thickness. The studs can be welded into Picks, Hammers, etc.

—ALSO—Cast-Steel Tappets, Cams, Hammers, Gearing and Castings

OF ALL KINDS, A SPECIALTY.
It takes forty days to fill orders.

CALIFORNIA BRASS FOUNDRY,

No. 125 First street, opposite Minna, SAN FRANCISCO.

ALL KINDS of Brass, Composition Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Belts and Gongs of superlative tone. All kinds of Cocks and Valves. Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WEED. V. KINGWELL.

THOMPSON BROTHERS,

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rico's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand. If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIAN.

For further particulars apply to R. HOSKIN, Dutch Flat, Or R. R. & J. CRAIG, Room 6, 240 Montgomery st., S. F. WILLIAMSON & COREY, Marysville. Agents Dutch Flat, Aug. 10, 1873. 6v27-2m

GRAND INDUSTRIAL EXHIBITION,
To be held under the auspices of the
MECHANICS' INSTITUTE
OF SAN FRANCISCO, CALIFORNIA,
Opening on August 18th, 1874.

The Board of Managers herewith announce that a grand Industrial Fair will be held in the city of San Francisco for 30 days, opening on August 18, 1874.

In view of the increasing commercial and manufacturing importance of San Francisco, its contiguity to and close connection with the various countries bordering on the Pacific, the managers have constructed a Pavilion having a floor area of 150,000 feet, and have invited to it all who are disposed to come and exhibit. All exhibitors will be placed on the same footing. Motive power will be furnished free.

The building will be open day and evening, and every facility will be extended to exhibitors and visitors. Application for space must be made without delay to the Secretary of the Board of Managers, 27 Post street, San Francisco, and all inquiries will be answered and information extended promptly.

No space can be secured unless applied for before the 20th of July next.

Knox & Osborn's Quicksilver Furnace.

The discovery within the past year of a large number of quicksilver deposits in this State, and the scarcity of the supply of the article, have caused much attention to be turned to the subject of quicksilver. In order to ensure cheap mining of this article the form of furnace used is important. Several inventors urge the claims of their respective furnaces upon the miners, and the subject of style of furnace, percentage saved, economy etc., have provoked considerable discussion. During latter months of the past year our columns bore evidence of the interest

grate level, showing the form of the fire space and outlet vapor passage; also the form of the interior of the furnace at the fire level, the top representing the fire, and opposite to it the vapor passage.

The furnace is intended to work continuously for months without stopping. One of them now in operation has run 12 months without stopping the fires, and no reason appears at present why it should not continue to run as much longer. The owners claim that if properly worked, there is no possibility of the operatives being affected by the vapors of mercury in a way prejudicial to health, which ought to be a strong recommendation. Another feature claimed for the furnace is the manner in which

varying circumstances, price of wood and quality of ore, making the cost more or less. This cheapness of reduction naturally saves much expense in sorting ore. When material can be put through the roasting process for 56 cents to \$1.25 per ton, it is not profitable to spend much time in cleaning the ore of surplus rock, as it can be done only moderately close for \$5 per ton, while in sorting close for retorts it always costs more if the work be well performed.

It is not claimed by the inventors that this is the cheapest furnace, considering only first cost; but they aver that the economy of working, repairs and complete reduction, render it cheaper in the end. The furnaces may be made available for any kind of fuel. Rough

the ore open, and to some extent admitting the fire into the center of the mass, while by its own combustion it puts fire into its very midst. We are told that in this way, with moderately dry ore, twenty tons of fine and coarse have been put through in twenty-four hours.

The inventors, Messrs. Knox & Osborn (Golden Gate Foundry, Nos. 19 and 21 Folsom street, San Francisco), have also prepared estimates of cost and plans for building small prospecting furnaces for mines not fully developed.

MINERAL LAND DECISION.—Commissioner Drummond has made a very important ruling under the law providing for the sale of lands

Fig. 1.—Cross Section of Furnace, Walls and Vapor Way Arches.

Fig. 3.—Horizontal Section at Fire-Grate Level.

Fig. 2.—Cut Transversely from Fig. 1.

KNOX & OSBORN'S QUICKSILVER FURNACE.

which these questions excited. Without presuming to decide on the relative merits of the different furnaces now in use, we give, for the benefit of our readers, diagrams showing the construction of the Knox & Osborn furnace, a California invention, which was frequently mentioned in the discussions in our columns last year. There are now seven of these furnaces working in this State, at the following mines: Redington Quicksilver Mining Co., Knoxville, (two); California Quicksilver Mining Co., Knoxville, (one); Manhattan Co., Knoxville, (one); Cerro Bonito Quicksilver Mining Co., Panoche, (one); Phoenix Mining Co., Pope Valley, (one); and Etna Mining Co., Pope Valley, (one).

The cuts show the interior and walls of the furnace, as if cut in twain in the middle.

Fig. 1 shows the charging port at top, and draw or discharge at bottom; also the width of the chamber from top to bottom, transversely with the current of vapors.

Fig. 2 shows the furnace cut at right angle, or transversely from No. 1, and showing charge and draw-ports, as also the fire and vapor channel; also the form of ore shaft where the vapors pass through the ore in reduction.

Fig. 3 shows a horizontal section of the fire-

the heat is economized. By a patented arrangement of air-flues, they are enabled to take the heat from the roasted rock, and, by transferring it into fresh air, thus make this a hot-blast furnace. This is accomplished, not by forcing the air in, but by producing a partial vacuum by means of a suction-pump on a blower. A large portion of this hot air is admitted above the fire, that it may go directly into the charge of ore, where the oxygen, combining with the sulphur, produces much of the necessary heat, diminishing to that extent the amount of fuel required.

At the mine of the Redington Quicksilver Co., where the ores are rich in sulphur, one cord of oak wood runs two of these furnaces for twenty-four hours, during which time forty-eight tons of ore are put through. At this mine, these two furnaces being worked at the same time, the inventors inform us that the expense of running them has been reduced below that attending any other single furnace; and a careful account of expenses kept shows the cost of reduction at these furnaces to be only fifty-six cents per ton! At single furnaces, reducing twenty to twenty-four tons of ore per diem, the cost of reduction will vary from eighty cents to one dollar and twenty-five cents,

wood and logs which cannot be split, of twenty inches diameter, pass into the fire, and when wood is scarce and chapparal abundant, through the use of an attachment planned by Knox & Osborn, brush serves the same as wood, and even coal or coke could be made to answer equally well if other kinds of fuel could not be easily obtained.

This furnace was never intended to run a greater amount of fine ore with the coarse ore or broken rock, than would allow the gasses from the fire to freely pass through and amongst the ore. If a greater amount is put in, it checks the reduction by keeping the fire from the center of the mass of ore, and by driving it along each side of the furnace, only heating the center of the mass through contact of particles or conduction; and as this loose ore is a very poor conductor, the heat makes its way through it slowly. This change in the size of the ore will reduce the working from twenty-four tons per day to sixteen, and if the ore is very wet, to twelve or fourteen tons per day. The inventors have found, however, that this falling off may be partially remedied by putting in some wood with the ore at the charging port. This wood serves the place of coarse ore in part, keeping

within the mineral belt. The Comstock lode, Nevada, is situated in township 17 north, range 31 east of Mount Donner. The meridian portions of this township, comprised in sections 19, 20, 21 and 28, were returned by the Surveyor-General as rocky, barren and mineral in character. These portions, however, have been claimed by the Central Pacific Railroad Company and the State of Nevada. In order to procure their patents these parties have filed evidence to prove that the lands do not contain any known veins of gold or silver or other minerals, and that no valuable minerals have been found therein. The commissioner decides that when lands have been returned as mineral in character, he shall require that the burden of proof shall rest on parties who desire to locate, the same as agricultural lands, and it is sufficient to prove that there is no evidence that they are mineral in character. Parties must show clearly that the lands are agricultural in character. In the cases of the applications made by the railroad companies and the State of Nevada, no such proof is given, and on the contrary it is shown that the lands are barren and unfit for cultivation. The lands are therefore reserved from entry, and held as mineral lands.

CORRESPONDENCE.

Mining in Plumas and Sierra Counties. No. 5.

[By our Special Correspondent.]

Pine Grove,

Lying between St. Louis and Howland Flat, was, not many years ago, a lively mining camp; but owing to the introduction of modern improvements in mining, the force of men required to work the mines is so small, as compared with the old system, that nearly every mining town in the State looks dull to the stranger, until he understands the reason why it seems so. Pine Grove has shipped her millions of treasure to all parts of the world, through the distributing office, San Francisco, and has millions more still garnered in her golden treasury vaults. The Comet company, of this place, rented the water privilege from the Union company of Howland Flat, after its first use by the latter company, thus enabling them to hydraulic off the old drifted out ground, that would otherwise have been worthless to the company, making it pay them some sixty-six cts. per cubic yard. Immediately adjoining the Comet is a large amount of consolidated ground, owned by Thomas Eve, Esq., a great portion of it being hydraulic ground, and if properly opened, the balance can then be successfully drifted. Capitalists would do well if they could succeed in obtaining possession of this ground. In going still further up we pass to the right of

Granite Hill,

Which is all owned by Messrs. George Cox & H. F. Williams, aggregating about 100 acres. They are well prepared for working their mine to an immense advantage; having a copious supply of water owned by themselves. Two sets of monitors are employed, crushing and crumbling away the gigantic banks that rise high in the air above them, rolling the precious metal downwards, where it calmly rests, until resurrected by its lucky owners. In turning around a sharp point, we come in sight of the once celebrated

Howland Flat,

A beautiful town in summer, as it nestles in quiet repose at the base of Table Rock, which towers high in the air with majestic grandeur some 7,200 feet above the sea level. But now it looks as though an avalanche of snow from the mountain side had buried it almost from sight. Nearly all of the claims in this place have been worked by the drifting process, and have paid well for the money invested. All of the front ground has been consolidated, and is owned by Messrs. Stout, Chittenden & Co., who design opening it so as to work all of the ground by the hydraulic process. There is none but who admits it will pay the company handsome dividends, although most of the ground next the bed rock has been drifted out, yielding several million dollars. One mine alone, the Union company, in its palmy days, produced over one million dollars. About one mile east of the Flat, we came upon a little mining camp called

Potosi,

Where the Hawkeye, Pittsburg and Monumental companies have worked with immense results, by drifting out on the main channel of the "Blue Lead." Immediately above them is a

San Francisco Company,

Known as the Empire company, who are, under the able management of Mr. DeNoon, who is one of the shareholders, about opening out on the same channel, with fine prospects ahead. In crossing the several head branches of Slate creek, we first come to a small town, that once sported the euphonious name of

Whiskey Diggings,

A name that still clings to it, although by an act of the Legislature, it was changed to that of Newark. But the miners have nicknamed it Widowville, owing to the numerous grass widows and real widows, who have, and still do, make it their home. With three such names the town is deserving of success.

We find here several companies engaged in running tunnels to tap the rich channel of the western branch of the

Slate Creek Basin Channels,

Which has paid, enormously in former years along the rim rock, where the gravel has overflowed its rich, but deeper bed.

About one and one-half miles further up, on the head of a branch of Slate creek, is another small town called Hepsidam, where we find the "North America," Pilot Peak No. 1, and Pilot Peak No. 2, all three of which are tunnel claims. In a recent letter to the *Mountain Messenger*, its La Porte correspondent said, that "the main lead of the North America had been lost, having jumped off in Pilot No. 1." This is a mistake. No doubt the *Messenger's* correspondent was misinformed on that point, and in no wise intended to misstate the prospects of the company. Instead of losing the lead, the foreman and others inform me they have just struck it. He says there is not a white man working in the claim (some eighteen in number) but that

will tell you his pick is worth to the company \$20 per day. The gold can be seen all through the gravel while working with the pick in the different breasts. Mr. Morgan, the superintendent of the company, is deserving of great credit for the persevering energy with which he has prosecuted the work in this mine. No matter what the obstacle that appeared in his way, it must be removed. In all his efforts to benefit the company, he has had the able and efficient support of his foreman, Myles Schofield. There are a great many men employed rolling the yellow dust to the front, and the shareholders in "Merry England" will, before the season has passed away, have no cause to regret investments in the North America. Joining the North America on its northerly line is the

Pilot Peak No. 1,

Whose tunnel is now in 1,800 feet, and it will not be long before they tap the same rich lead struck in the North America, as it runs directly across the Pilot ground, and its course is not far from the inward terminus of their tunnel. Contiguous, and running parallel with Pilot No. 1, is

Pilot Peak No. 2.

The company are not working their claims, for the want of capital; but have, I understand, banded them to San Francisco capitalists for the pitiable sum of \$12,000. It is no wonder these men grow rich, when such valuable property as this will eventually become, can be obtained for the paltry sum of \$12,000. This system of

Bonding Claims

Works great injury to the State and country wherein located, as well as to the parties bonding. If the system was done away with entirely, and capitalist would invest their money at once, how much sooner our vast resources would be developed, and their golden treasures thrown into the market. As it is, most claims are bonded to speculators. The claimant may live in hopes of getting his money at the expiration of the bond (which is generally from one to two years), only to find them blasted by disappointment. There may have been plenty of opportunities to sell, but that right is denied, because of the bond. One might starve before he could realize a dollar from valuable property he owns but cannot control. My remarks will more particularly apply to mines that are known to be valuable and in a state of non-development for want of capital by their poor and unfortunate owners.

From Pilot Peak No. 2 we turn our face westward. Passing Newark, we come upon the old Sierra Nevada tunnel mine to the left of the Gilsonville road, situated on one of the tributaries of Slate creek. This mine has yielded its thousands of treasure, but at the present writing is nearly worked out. About one mile further down the creek we come upon the little town of

Gibsonville,

Which, like most of the mountain towns, has seen its best days. The claims at this place have been mostly tunnel mines. Messrs. Lang & Brandenburg, have completed their preparations for working these old worked out mines, by the hydraulic process, and will, no doubt, be well rewarded in their enterprise, as it is a well known fact that all the surface gravel embraced in the "Blue Lead" pays well—some of it immensely. Jillsou, Gould & Co., at the west end of the town, are fully prepared to set their giant pipes to work as soon as water starts. This company have a large amount of ground, which pays them well for their money and labor invested in opening them up. About one-half a mile below Gibsonville, we come to

Gibson Creek.

Here we find the Chalcedony, Boot Jack and Taber mining companies, all of which are tunnel mines. Taber & Co. have a valuable mine here in course of development. Some of the heavy capitalists of San Francisco are interested with him, and no one doubts for a moment the richness of the mine. The Chalcedony and Boot Jack companies have labored under great disadvantages. The ground they have worked has been rich; but lying low, they have great difficulty in keeping it free from water, not having machinery of sufficient power. I understand the Chalcedony was bonded in San Francisco for \$39,000, the bond running out last February. If it were the fault of the San Francisco party that the mine did not change hands, they certainly, for once in their lives, made a great mistake.

Further down are the Lsst Chsnce and Go-Ahead companies, composed mostly of owners in the Bald Mountain claims, in Forest City. I understand they intend to commence this spring to open up and develop their claims, being confident of success; and think they will rival, if not excel, the best mines in Northern Sierra. Here I shall close my brief review of those mines in Sierra lying west of Slate creek.

In my rapid transit from Newark to Gibsonville, I forgot to speak of the Mount Pleasant mine—

The Union.

This has been a good tunnel mine, but is nearly worked out. If the company had water for hydraulizing, it would pay well for years to come. The Michigan Company are intending to open up their claims this season; and if they prove as rich as they are thought to be, Gibsonville will be able to appear in a new dress on Sundays.

In one of my previous letters I spoke of the consolidation of the Buckeye and Monitor claims, at Sawpit Flat, by J. H. Thomas, of

La Porte. The former claim recently made a clean up, averaging \$25 per day to the pick. Mr. J. C. Foulk, the Superintendent, says if Mr. Thomas had not already purchased, he could not get the claim for double the money paid, as they have struck gravel richer than ever, that promises to be very extensive.

MAXIMILIAN.

St. Louis, March 29, 1874.

Glycerine in Mucilage.

EDITORS PRESS:—I see in your paper of March 7th, a prescription for paste, as follows: Gum Tragacanth..... I drachm.
Glycerine..... VI drachms.
Aqua Pura ad..... X ounces.

Please tell your readers if the glycerine has any adhesive properties; if not, what advantage there is in adding it.

A good paste is made of rice flour. Respectfully,
J. H. WALCOTT.

San Francisco, March 28, 1874.

[The glycerine is used for several reasons. Its antiseptic and undrying properties ensure permanency to the mucilage; its syrupy consistency gives a good "body;" but the principal reason is found in the fact that gum tragacanth appears to be composed of two different constituents, or to exist in an amorphous condition, one part soluble in water and resembling gum arabic, the other swelling in water but not dissolving—glycerine renders this latter portion manageable and thus produces a mucilage of uniform consistency. We think that the receipt for rice paste has been published in the Press.—Eds. Press.]

Platinum.

In speaking of the precious metals at the Vienna Exposition, *Engineering* speaks of platinum as follows:

As for our last precious metal, platinum, we looked in vain for samples from Russia, which is the chief producer; but in 1871 she only got 4,100 lbs. of this precious and valuable metal. The platinum diggings of Russia are near Bogoslovsk, Miask, Newjansk and Nischnei Tagilsk, in the Ural mountains; they were discovered in 1824; and at six places in 1868, 1869 and 1870, from 494,000, 367,000 and 263,000 tons of sand, 6,675, 7,770 and 6,455 lbs. of raw platinum were obtained respectively. The metal contains always some other substances; thus Le Play found in a sample from Nischnei Tagilsk, 75.1 platinum, 1.1 palladium, 3.5 rhodium, 2.6 iridium, 0.6 osmium, 2.3 osmium, 0.4 gold, 1.0 copper, and 8.1 iron. The raw metal is almost entirely sold to England and Paris, at a price of about 144. per pound of pure metal. It is there refined before it can be worked up into manufactured articles. Of such objects we found some chemical apparatus exhibited by Demontis-Gueneres & Co., who hold a leading position in Paris, and Heraus, of Hanau, in Germany, the former firm also showing metallic ruthenium and palladium. The prize for such work, however, is due to Johnson, Matthey & Co., of Hattongarden, London, who exhibited a splendid platinum still for sulphuric acid works, worth about 3,500. There was also an ingot of palladium worth about 2,000, which had been extracted from a mass of platinum of a value of over one million pounds. Very remarkable also was a nugget of platinum, weighing 4,728 grammes, in a collection of platinum sand and washed platinum, while the alloys of iridio-platinum and platino-iridium deserved great attention, the latter being intended for normal metres, and being smelted in lime crucibles, after the method of Deville. Amongst the exhibits from New Zealand was also a sample of feriferous platinum sand from Orepuki diggings, north shore of Foveaux straits. The extracted metal contains 55.37 platinum, with a little iridium, 13.65 iron and 0.98 gold and quartz. In the Imperial Brazilian Museum's collection were also some samples of platinum sand and platinum from Minas Geraes, in Brazil, where its original matrix is syenite. The annual produce of platinum in Brazil, Columbia, California and Borneo seems not to exceed about 1,000 lbs.

A CURIOSITY. — Ex Governor Blasdel has shown us a great curiosity which he found in the Franklin mine, American Flat. It appears that in some part of the mine a wooden spout was put up to conduct a stream of water out of the way of the men working in a drift or tunnel. This was done years ago. During a late visit to the mine Mr. Blasdel discovered that the inside of the wooden spout had been formed a second spout of stone. The stone resembles marble, and both on bottom and sides appear regular layers resembling the "growths" of a tree, about an eighth of an inch in thickness and differing slightly in color. This stone cast of the spout presents on the under side a fac simile of the grain of the wood of the board forming the bottom of the spout, and it was the opinion of many persons who examined it, that a portion of the wood had been petrified and thus incorporated in the mass of stone forming the imitation spout. The material thus solidified appears to be almost pure silica, with perhaps aggregations of some grains and particles of other matter. The water forming this singular concretion, almost as hard as flint, is as clear as the water of any ordinary spring or fountain. A similar coating of stone would doubtless be formed in or upon any article carved in wood and placed where the water would flow over or around it, and some curious things might thus be formed. —*Enterprise.*

The Bladen Mines.

The San Diego *Union* says: As this new mining district has recently absorbed a large share of public attention, a more detailed description of the locality and ledges than has yet been given, will be of interest. The Bladen gold and silver ledge is situated near the summit of the highest foothills of the Coast Range mountains, and is distant about eighty miles from San Diego, and fifteen miles northeast of Temecula. The mining district borders on the San Jacinto plains, at the base of the San Jacinto and Coahuilla mountains. It is twenty-five miles from "Old Grayback," the highest peak of the San Bernardino mountains.

The ledge has been discovered at different points each side of the Bladen mine for a distance of about fourteen miles, and bears a northwesterly and southeasterly direction, following the range of hills in as straight a line as may be in the direction of the Julian mines on the south, and the San Bernardino mountains on the north.

Water is abundant at the mines at this time, and is said to run in the San Jacinto creek during the year. Oak timber is plentiful enough in the district for fuel, and will supply quartz mills for many years to come; while in the mountains, from fifteen to twenty miles distant, abundance of fine redwood and cedar timber of the best quality is found.

The appearance of the country is in every way favorable to the existence of extensive mineral deposits.

The Bladen ledge has been opened up in six or eight different places by shafts sunk only a few feet in depth. The deepest shaft is about fifty feet, in which the ledge is solid the whole distance between the wall rocks, and is over four feet in width. In all of the other claims the ledge averages over six feet in width from the surface down, and in some of them much more than this width. The "walls" are excellent, with the proper dip and gauge well marked in every claim.

The altitude of the locality is about five hundred feet below that of the Julian district, which is about sixty-five miles distant. The character of the country immediately surrounding the Bladen district is more hilly and broken than that around Julian, and the land apparently is neither as good for farming or grazing as that of the latter section. But six miles southwest the country opens into low rolling hills, covered with grass and flowers, which are still more abundant and beautiful in the valleys which lie at short intervals between the low ranges and extend for miles in many directions, until they widen out into the Temecula valley, which is an extensive country, of good soil, well watered and timbered.

North of Bladen, about five miles, is the head of the San Jacinto plains, from which point one might travel a long day's journey north, south and west, over a country as level, apparently, as a floor, save where occasionally barred by a grassy hill, jutting out to mark the boundary separating one beautiful valley from another. This part of San Diego county is unsettled, although profitable farms and homes might be made there for hundreds if not thousands of families. About fifty thousand sheep and many cattle roam the hills and valleys.

Two mining districts have now been formed; the Bladen and the Crystal district, which adjoins the former. Good local mining rules have been adopted in conformity with the provisions of the mining laws of Congress. Work on the ledges will be pushed with vigor, and if the ledges prove permanent, of which there is little doubt, mills will soon be running, and there will soon be a very prosperous mining camp in that northern portion of our county. No observer of experience has expressed a doubt of the existence of a boundless store of mineral wealth. The ore has been tested several times, and yields from all parts of the ledge not less than \$80 in silver and \$20 in gold per ton.

GOLD ON THE YELLOWSTONE.—Since the summer of 1873, and at regular intervals, discoveries of gold in paying quantities have been reported from the tributaries of the Yellowstone river in Montana. The latest exciting news from the undeveloped auriferous deposits of the Territory is contained in a letter addressed to the *Bismarck Tribune* by a resident of Bozeman, Montana. According to this communication, the new El Dorado is the Tongue river valley, about midway between Bozeman and Bismarck. In February a large expedition was organized at Bozeman, composed of over 100 men armed with needle guns and three pieces of artillery, with plenty of grape and shell. Other expeditions are forming, which will increase the number of miners and explorers near Tongue river to 200. The original discoverer says that he sunk shafts in two gulches and on one bar, and from 11 buckets of dirt he got \$6.60 of coarse gold. The expedition mentioned carries provisions sufficient for each man for six months. They go determined to make a permanent stand and hold the country, if possible. Many business men are preparing to transfer their business to the mines in early spring.

QUICKSILVER.—The annual report of the Quicksilver Mining Company has been presented, showing that this Company have paid up all the first mortgage bonds, which were due on the first of June last, and amounted to \$500,000. They have also a balance on hand of \$320,000. The contracts to supply their products at \$30 and \$50 per flask have expired, and the company have now advanced their rates to \$100 per flask.

SCIENTIFIC PROGRESS.

Sulphuric Acid.

Sulphuric acid, or oil of vitriol, is certainly the most important of all chemical products. It is seldom used for domestic purposes, and we presume there are thousands of our readers who never saw an ounce of the concentrated acid in their lives. But this sour, corrosive liquid is of immense value to mankind. In the great industrial world it occupies a position second perhaps to no other substance. If the amount of its manufacture and consumption by any people does not measure the degree of their civilization, it must be regarded as a common pivot around which revolve all the industries pursued by any nation.

It is through the agency of this acid that we have soda, soap, glass, paper, bleaching and dyeing salts, nitric acid, aniline colors, kerosene oil, superphosphates for farmers, and a thousand other agents which our modern civilization demands. Indeed, it is from the reactions to which it gives birth, that the greater part of the chemical products employed in the arts and sciences, the greater part of the medicaments used in the art of healing, result. Only those who are engaged in some pursuit demanding its employment, or those who are specially acquainted with chemical industries, have any correct idea of the colossal scale upon which this acid is manufactured both in this country and in Europe. At one establishment in the city of Brooklyn, N.Y., the stream of concentrated acid which runs from the platinum retorts is nearly three-fourths of an inch in diameter, and this stream is constant, day and night, month after month, and year after year. This is but one of the many immense acid factories scattered over our country.

In Europe it is produced upon a still grander scale, and the united streams of the fiery liquid, which flow from the thousands of retorts in active operation, would aggregate in volume some of the mountain cascades so much admired in Switzerland. It is estimated that the annual production in Europe reaches 800,000 tons. In order to gain some conception of the volume of the liquid, let us imagine that all the acid made in Europe were carried to Central Park and poured into a canal lined with lead. This canal would require to be six and a half feet deep, 34 feet wide, and more than half a mile long. The acid would nearly fill the basin of the beautiful lake over which the boatmen convey passengers in their gay barges, during the summer.

In Europe the acid is manufactured mostly from iron pyrites, and in this country the pyrites are to a considerable extent being substituted for sulphur. The acid made in this city from the mineral is sold at a lower price than that from sulphur. The strength and effectiveness of the acid from the two sources are the same, but the iron sulphide is apt to contain traces of arsenic, which is found in the acid. This does not, however, interfere with its use in the arts. The enormous consumption of the pyrites in Europe in this manufacture fills one with astonishment. It is estimated that more than 660,000 tons are used, a quantity which would require nearly 100,000 railroad cars to convey the mineral from the mines to the acid works. The statements here presented are well calculated to show the great importance of one of our industrial products not well understood by the majority of readers. —*Journal of Chemistry.*

THE OXYHYDROGEN LIGHT.—Dr. John Nicol describes, in the *British Journal of Photography*, a new mode of making lime cylinders as follows: Four parts of precipitated chalk are intimately mixed with one part of ponderous carbonate of magnesia, and the whole made into a stiff paste with mucilage of gum arabic. The mass should be well beaten in a mortar, or in any other way to ensure thorough incorporation, and made a little stiffer than glazier's putty. It then may be rolled on a slightly oiled marble or porcelain slab, or smooth board, till it assumes the form of an ordinary ruler, and then cut into suitable lengths. The holes are easily made with a wire of the proper thickness; and if the wire be "olive ended," like those used for piercing tobacco pipe stems—that is, having a tiny bulb or button at the end to be inserted—it will penetrate straighter and easier. The cylinders thus finished only further require drying, which may readily be done in the kitchen oven; and as they must be thoroughly dry, they may be left there for two or three days.

THE heat of the sun nowhere penetrates the ocean more than six hundred feet. At a depth of from one to two miles the temperature is about four degrees below the freezing point, caused, probably, by the ice water poured into the ocean from the Arctic regions, northern and southern. This, being heavier than the surface water, sinks to the bottom and forms currents ever flowing toward the equator, to take the place of the water which, there heated and rendered lighter, rises to the surface and forms the Gulf and other warm streams. As these flow again toward the Arctic regions, it will be seen that a perpetual circuit is kept up, the Arctic waters continually lessening the heat of the tropical waters, and these, in their turn, giving out their heat as they flow away from the tropics. England is warmer than Greenland only because of the warmth derived from the Gulf Stream.

Electrical Art.

Marvelous things have come from the jerking of the leg of Volta's frog. The nerve fibers of that dissected Batrachian have culminated in telegraph wires stretching over the globe; and the mysterious force that thrilled them under the hands of the earliest of electrical experiments is now applied to half a hundred uses, some of them utilitarian to the case, some of them reaching upward to the confines of a man's loftiest philosophical knowledge. The wires that Melloni extended from a thermoelectric pile to the neck of a sleeper still prove the correlation of vital and physical force; the conversion of electricity to heat when retarded by an imperfect conductor, is the foundation of the most recent plan for illuminating streets and buildings.

Indeed, vast as has been the advancement of electrical science, we are hardly more than beyond its nearest and narrowest edges. Some time since, in conversation with one of the most eminent of electrotypers, we were told that more than one obvious drawback from perfection in that much improved art is yet to be removed by new inventions; studying the records of 30 years ago, concerning the relations of the electric fluid, so called, to vegetable life, we found the question of its utility in promoting plant growth not yet fully answered in the negative; taking a broad view of many of the uses to which bleaching powders are put, we find ozone proposed as a substitute, and its chief obstacle, its cost, only to be obviated by cheapening the production of the electric currents, by which ordinary oxygen is converted into its more powerful allotropic form; casting a glance at the science of medicine, we find electricity, long the foundling of empires, giving evidence of a value not yet fairly understood, and it may be, as yet, somewhat dangerous to trifle with; and in the more ordinary and common place realm of the mechanics' workshops, and the draughting board of the engineer, electricity takes its place in projects for motive power, for regulating time pieces, for protecting buildings from fire and burglary, for signaling on railways, and for igniting the gas jets in the lamps of streets. And even more than this, telegraphy itself, which has exercised the best inventive intellect of the world for more than twenty years, gains new triumphs in novel means of transmitting two messages simultaneously in opposite directions over the same wire, thus at once doubling the facilities of communication in all existing lines. From this hasty view of electrical art, and not one-half of the whole is here included, we may well venture the prediction that this occult science has yet undiscovered fields of usefulness before it; that new forms of industrial life are to arise from "the death and decay of metals" in the battery jars. —*Newark Manufacturer.*

WIND AND CURRENTS.—The commonly received hypothesis with regard to the trade-winds is now called in question by some of the best scientific minds. This hypothesis, as is well known, assumes that the lower strata of the atmosphere near the equator, being over-heated by the sun's rays, expand and rise into the upper regions of the aerial envelope, their place being taken by a cooler air, which rushes from the higher latitudes of the north and south; and, moreover, that the ascended heated air travels backwards, as an upper current, to the latitudes where the cool air originates, and then, descending again, the aerial circulation is completed. One of the most striking objections now made against this theory is, that the equatorial zone is far from being the hottest part of the tropical and sub-tropical regions. It is shown, as a matter of fact, that in the North Atlantic basin, the great Desert of Sahara has a temperature from twenty to fifty degrees hotter than the equatorial zone; yet, so far from a cool current of air being drawn in from the Atlantic toward this heated region, the northeast trade-winds pass straight onward in their southerly course, without the slightest indraught toward the African coast.

ODOR.—Mr. S. J. Lyman recently lectured in Montreal on "The Diffusion of Odor." The theories regarding odor were illustrated by many facts of great interest—indeed, it is seldom so much of interest is crowded into an hour's lecture. The history of Jane Bruce, who was deaf, dumb and blind, was given. This girl was left with only the sense of smell and touch, yet was able to recognize friends after a long absence by the characteristic odor of each, and even to select her own linen from the laundry. The fact of the Cariboo detecting the hunter's approach at a mile distance by the odor, was also given to illustrate its diffusion. Quite a sensation was produced when a pair of fine eekns were presented to the audience on the platform. These much dreaded animals, which are extremely pretty, were handled by the lecturer without fear, but it was difficult to impress the audience with the idea of their safety in so close proximity. Mr. Lyman proved that the odor from these animals was so diffused that there were only 1-23,232,000th of a drop in each cubic foot of air pervaded by this nauseous perfume.

SEVERAL specimens of barrels of novel construction were recently on exhibition in the St. Louis Exchange. They are double-staved—really a barrel within a barrel—and all joints being broken makes them perfectly water-tight. The cost of them is to be no more than that of an ordinary barrel, and they are intended to carry all kinds of liquids, as well as flour, fruits, etc.

MECHANICAL PROGRESS.

The Largest Gun Ever Made.

"The Sataliff gun, recently cast at the West Point Foundry, weighed in the rough state 72,000 pounds, and is the largest gun ever made. The gun is made of iron, standing a pull of 30,000 pounds, and is now 19 feet long. It is to have a steel barrel four inches thick at the breech and three at the muzzle, with rifle bore, and weighing 44,000 pounds. The shot will be nine inches in diameter, and will weigh about 250 pounds. It will require eight days to cool the monster by the Rodman process, water being run through the bore during all that time. The gun is made for Government experiments."

The statement that this is the largest gun ever made, appears to be a very decided mistake.

Mallet, in speaking of cannon, divides the subject into four parts, corresponding to the different epochs of improvement, and says:

"The first or earliest was that of stone balls—the stone of the ancient catapult transferred to a new agent of propulsion. The artillery prepared for throwing these was of great caliber, sometimes as much as two feet, and was either formed of forged iron staves, and rings shrunk on them hot, as in the Bombard of Ghent, Mons-Még at Edinburgh, etc., or cast in bronze as in the Kammerlichs of the Dardanelles."

As early as 1452, Mohammed II. established a foundry at Adrianople, for the express purpose of casting "a cannon capable of throwing a ball of stone of sufficient size to batter the walls of Constantinople." Such a cannon was then cast of brass, by one Urban, a Dacian or Hungarian, who had deserted from the Greek army. In speaking of this monster cannon, Gibbon says that it was of such enormous size that in order to transport it, it was necessary to link together 30 wagons; and a team of 60 oxen was required to draw it.

According to Leonardus Chiensis, the ball for this cannon weighed 1,200 pounds, but this statement is hardly to be believed, especially in view of the fact that other authorities place the weight at 600 pounds. Gibbon tells us that the explosion was felt or heard for a distance of 12 miles, and the ball was driven above a mile; and on the spot where it fell it buried itself a fathom deep. The caliber of the gun was 22 inches, and unless the stone, of which the ball was made, was exceedingly heavy for stone, it would be impossible for a ball of 22 inches diameter to weigh 1,200 pounds.

We are also told by Gibbons and others, that a cannon more enormous than that of Mohammed, just mentioned, still guards the Dardanelles. This cannon has a caliber of 28 inches, and if the report of its trial a few years since be true, "the effect was far from contemptible." "A stone bullet of 1,100 pounds weight was once discharged with 330 pounds of powder; at a distance of 600 yards it shivered into three rocky fragments, traversing the strait, and leaving the water in a foam, again rose and bounded against the opposite hill."

Phillips tells us that the largest cannon ever made was cast in India in the year 1685, of brass; but we are unable to find any account which will tell what part of India, or the dimensions of the cannon.

He also states that at Ehrenbreitstein Castle, one of the strongest forts in Germany, is a prodigious cannon, 18½ feet long, a foot and a half in diameter in the bore, and three feet four inches in the breech. The ball made for it weighs 180 pounds, and its charge of powder is 94 pounds. The inscription on it shows that it was made by one Simon, in 1529. In Dover Castle is a brass gun called Queen Elizabeth's Pocket Pistol, which was presented to her by the States of Holland; this piece is 24 feet long.

The largest, though not the heaviest, gun of which we have any accurate description, is the Great Kremlin Gun of Moscow. An inscription on it shows that it was made at Moscow in 1586. The dimensions are: Total length, 18 feet; exterior diameter, about 48 inches; and caliber, thirty-six inches. The weight of the cannon is 97,000 pounds. All the cannon mentioned so far were originally intended for throwing stone balls; and after the idea was conceived of casting metal balls, they were tried in the old cannon, many of which were thus destroyed.

In 1856 a mortar was constructed at Woolwich Arsenal, with a caliber of 36 inches. It weighed about 35 tons finished. The shell for this mortar weighed about 3,000 pounds.

Another mammoth mortar was constructed in England a few years since after plans by Robert Mallet. The complete mortar weighs 50 tons, and is of 36 inches caliber. This mortar was constructed at an immense cost, but proved to be an utter failure. The shell unfilled weighed about 2,600 pounds.

The great cast-steel gun of M. Krupp, of Essen, Germany, weighs 112,000 pounds, or 52 English tons, and with its carriage and turntable weighs 90 tons. The diameter of the bore is 14 inches, and the length of the gun is 17½ feet. Its solid shot weighs 1,212 pounds, and its shell 1,030 pounds.

The largest gun ever made, intended for throwing metal projectiles, was made at the Fort Pitt Foundry, Pittsburgh, Pa., on the

11th of February, 1863, under the superintendence of R. Anlick, U. S. N. The muzzle is marked: "20 inch No. 1, Fort Pitt, 1864, 116,497 pounds." The dimensions are: Total length, 20 feet 3½ inches; length of bore 17 feet 6 inches; greatest diameter, five feet four inches; least diameter, two feet ten inches; caliber, 20 inches.

From this it would appear that the Sutcliff is not the largest gun ever made, but that, on the contrary, guns of larger size and greater weight were made several hundred years ago, and from that time to the present the largest gun made for modern projectiles being cast in the United States.—*Arifan.*

Agricultural Machinery.

Prof. Fawcett, in his able paper on Wealth and Wages in Great Britain, says: Numerous instances may also be given of the extent to which employers are induced to economize labor by the introduction of improved industrial processes when trade is unfavorably affected by any such circumstances as a deficiency of raw material or a scarcity of labor. Thus it is said: "In their gallant struggles in the difficult times following the war in America our manufacturers developed the resources of machinery to a greater extent than had ever been attempted before, and they succeeded in making a considerable reduction in the amount of labor employed." In consequence of the extremely high wages which are prevalent in the United States, Americans are far more interested than Englishmen in applying machinery with the view of saving labor. Machinery is not only far more largely used in agriculture in the United States than it is in England, but many of the improvements which we have introduced into agricultural implements have been obtained from America. I find it stated that in the United States the application of labor-saving machinery to agricultural operations is increasing every year. The number of patents issued for agricultural implements was, in 1847, 43; in 1863, 390; in 1864, 563; in 1866, 1778; and in 1867, 1800. It can scarcely be doubted that even the comparatively small rise which has taken place in the wages of English agricultural laborers since the formation of agricultural unions, has already acted as a stimulus to many farmers to adopt various means of economizing labor, such as the employment of more machinery. If the supply of agricultural labor should be diminished, as seems not improbable, by a large emigration of agricultural laborers, it cannot be doubted that the farmers would be prompted to make still greater efforts to economize labor, and thus the rise in wages, which would naturally result from a diminution in the supply of labor, would be to a considerable extent counteracted.

THE CRANSTON ROCK DRILL.—An English exchange thus speaks of a new drill—one of the class intermediate between hand and machine tools: The machine is simple in its construction, and yet can be applied in a great variety of ways. For instance, the drilling tool is self-rotary, but the machine is so arranged that the drilling tool can be rotated by hand, which is of great advantage when working stone of unequal hardness or containing cavities. Again, the self-rotary motion can be readily exchanged to a slotting motion, and it can be applied to drill at any angle. It is much shorter and lighter than any other drill, the machine and tripod-stand together weighing only two cwt. The valve can be readily adjusted so as to regulate the force of the blow to the varying nature of the stone to be bored; and it will bore a hole two feet deep without changing the drill. Through Aberdeen granite it bores at the rate of from two to four inches per minute; and at an iron-stone mine in Cumberland, a hole, two inches in diameter and four feet six inches in depth, has been drilled in 32 minutes in hard hematite iron-ore, with a pressure of 35 lbs. of air at the machine. The drill is extremely strong and compact, and so easy to work that any ordinary miner can very soon acquire a thorough knowledge of it.

PEAT AND PETROLEUM.—Costly coal has had the effect of fostering the production of rival fuels and gas-producers. The result of experiment has been to launch various projects for producing peat fuel on the market. Gas is now obtained from petroleum instead of coal. These pregnant facts induce the careful observer to disregard the warnings of the croakers who predict the rapid exhaustion of our coal supply and the consequent decline of English prosperity. A hundred years ago the power of steam—if known to a few students—had not yet been applied to the purposes which have contributed so largely to the advancement of the present century. It is not likely that discovery will come to a full stop at once, or that our descendants will prove less able than ourselves to unravel the hidden secrets of nature.—*Iron.*

IMPROVED POTATO DIGGER.—A scraper removes the portion of the earth which covers the potatoes, leaving a corrugated roller suspended from the beam to act with good effect upon the smooth surface thus formed. A double or V-shaped plow, following immediately after, is thus enabled to elevate the earth in which the potatoes lie embedded, without injury to them, and with comparatively small expenditure of force. The roller also acts as a colter wheel, in respect both to the scraper and the plow, governing the depth to which they penetrate the soil.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

IREMS.—*Ledger*, April 4: J. H. Lowery has recently struck very rich diggings about one-fourth of a mile south of his residence. Ludikins & Co.'s claim, in French gulch, near Aqueduct city, is paying from \$5 to \$10 a day to the hand. Two claims new being worked by Italians near Aqueduct are doing remarkably well. One of the claims is paying over wages, while the other, we learn, returns \$20 a day to the hand in heavy coarse gold. The claims of E. Bowers & Bro., situated near Aqueduct, are looking remarkably well and are paying over wages. Extensive work is being done on the claims of Louis Ludikins; these claims are also located near the village. Mr. T. S. Craft is now mining in Red gulch, to find the channel lost by former miners in the gulch, with every indication of success. The claims of Rendall & Bricker, near Union mill, one mile from Pine Grove, are looking remarkably well. The hydraulic claims of J. Evans and Bro., in the vicinity of Aqueduct, are rewarding their owners for their labor. The claims known as the Alsado claims have proven to be very valuable.

PROGRESSING.—The tunnel recently commenced under Butte mountain, under the superintendence of Mr. George Kelton, is, we learn, progressing rapidly, the tunnel being now in over 50 ft. This enterprise is an important one, and if driven in a proper distance, we believe the most satisfactory result will follow.

GOOD ROCK.—The rock in the 900-ft. level in the Oneida mine continues of excellent quality, and the chimney increases in length. A further sinking of this mine will develop very fine rock.

CALAVERAS COUNTY.

WEST POINT DISTRICT.—*Chronicle*, April 4: A recent discovery on the north portion of the Woodhouse turns out splendid ore. The vein rapidly increases in width; ten inches thick at the surface, twenty inches at the depth of nine feet. About one hundred tons of fifty dollar ore are lying on the dumps of the Harris mine, near South Fork. Carlton mill has been running steadily on Lone Star ore since the weather permitted hauling. The Harris mill which was recently rebuilt, increasing its capacity to ten stamps, is also pounding away incessantly. The south level of the Zacatero, at the depth of about 290 feet, shows ore two feet wide, and plenty of free gold. The San Joaquin, a strong and valuable vein, is about to be re-opened. Judge Beeler is extracting some healthy ore from his mine above Skull Flat. The hoisting works, water wheel, etc., of the Pescos mine are completed. Sinking will be resumed as soon as the pump is planted. Good Faith is idle. The True Blue company have commenced work on their mine. An attempt has been made, by Stockton parties and others, to jump the Austrian mine, owned by A. M. Harris. The Yellow Jacket employs but a small force of hands, but the Superintendent intends to resume active operations in the main shaft at an early day. The hoisting works of the mine are a pattern of economy and convenience. The Granite Crown, one of the strongest veins of this county (over forty feet wide), will start up soon. The ore of this mine is low grade on the average, but its capacity is immense; coarse north and south; inclination east, contrary to the general dip of the veins in the vicinity. The Grigg's tunnel is within a few feet of one of the veins intended to tap. A portion of the property changed hands lately. The Henry tunnel is also being steadily extended. The Superintendent of the Mina Rica is expected here in a few days to commence active operations; also the Superintendent of the Ohio.

SAN BRUNO.—Operations are still briskly pushed in the San Bruno at Mosquito. Rock is not being taken out very rapidly at present, however, owing to the fact that work is principally confined to raising from the lower to the upper level for the purpose of ventilation. It is so hot in the mine that the workmen can only labor for a few minutes at a time.

INYO COUNTY.

ANOTHER MILL FOR BENTON.—*Independent*, March 28: Mr. Williams has commenced operations. A practical architect and draughtsman has been employed to draw the plans and specifications; considerable lumber is on the ground, and carpenters have gone to work on the frame. A five-stamp battery, two large amalgamating barrels and one settler goes into it; the engine is a plain slide valve, 10-inch cylinder, with a horizontal, tubular boiler, 14 feet in length by 3 feet in diameter. The barrels will be constructed in size similar to those in Mr. Mack's mill. The settler is a Henley improved, with iron bottom and wooden sides, all from the Union Foundry, Sacramento. The mill site is adjoining the foothill of the volcanic tufa forming the base of the lava mountain south of Benton.

MONTEREY COUNTY.

ASSAY.—*Argus*, March 23: An assay of a new lead just discovered by Mr. Charles Clusker, gives \$39.59 silver. The assay was made by Mr. Craig.

The following is the assay of the Alta mine, lately located by Messrs. Taylor and Cox:

Gold \$29.79; silver, \$67.87, and 70 per cent. lead.

NEVADA COUNTY.

IDAHO.—*G. V. Union*, April 4: New shaft now down very nearly to the 800-ft. level, and the men are now timbering it in a substantial manner. It will be sunk and timbered to the 8th level by about the 1st of May. Old works are now idle, and have been for some time; but it is the intention to repair the shaft, build a new engine house, put a new and much larger engine in it for use in pumping, exclusively. The month past shows an improvement in the ore coming out of the mine, the yield for the five weeks being about \$70,000.

EMPIRE.—Several hands were discharged from the Empire during the first part of the week, because underground appearances were not good. About the same time the miners retained struck into a rich body of ore. Next Monday the mine will put to work its usual number of miners, because of the good ore found within a day or two.

NORTH STAR.—Prospects improved greatly during March. Gold to the value of something like \$14,000 was taken out in a four weeks' run.

MAGENTA.—The mine is looking well and is furnishing an abundance of ore.

INDEPENDENT.—The new tunnel is about 700 ft. in length and strikes under the gravel bed. The mine will soon be drained and the work of drifting out will begin.

TOWN TALK.—Gravel is steady as usual, and gives its two owners something over a thousand dollars a month in profits.

CINNABAR.—Some specimens, which look like cinabar, were brought to town from the regions of lower Wolf creek. These specimens were found north of the Nickerson location.

MANZANITA MINE.—The Nevada Transcript of the 2d says: We yesterday visited this mine and found fifteen men busily at work, and better than all, they are all white men. Not a Chinaman works around the diggings. The Manzanita now is in working condition.

KENTUCKY.—This mine has been suspended as to operations for some time. Water in the mine and the difficulty of getting a supply of wood—owing to soft roads—caused work to be stopped.

RAY'S RANCH.—Shaft down only 50 ft., but it runs through fine rock. From the bottom of the shaft drifts have been run both toward the north and the south.

SLATE LEDGE, or Perrin's mine, is paying regularly with good appearances underground. About 50 ounces of gold per week has been taken from the amalgamators during the past month.

NEW YORK HILL.—Work is going steadily on in this mine. Connection with an old tunnel is being made to get air, which gives about 150 ft. of backs in the rich deposit. The lower tunnel is in 350 ft.

EUREKA.—There is nothing new to report from this mine. The mill is taking out gold which more than pays expenses.

COE.—This mine is drifting from the bottom of the shaft which is over 500 ft. down on the incline. The drift is in 25 ft. and is in good rock. The ledge is three feet thick.

SEVEN-THIRTY.—The new shaft is down about 50 feet and is in good quartz all the way.

DARTMOUTH.—Good gravel is coming out and is washed in a common sluice box. This gravel is paying, as we understand, about \$20 per day to the hand.

PLACER COUNTY.

ST. PATRICK.—*Herald*, April 4: At the St. Patrick mine the old administrator, J. H. Crossman, after a few months rest, has again taken hold. The mine never looked more promising.

MAMMOTH.—No. 1 shaft is down 115 ft. Water power (over-shot) is used for a motor. Levels are being driven to develop the mine. Its prospects are very encouraging. On No. 3 ledge the ore recently extracted and milled yielded \$23 per ton, at a cost not exceeding \$10 for mining and milling.

BUCKEYE.—The deepest workings are at the Buckeye, on which the company have recently erected new and substantial steam hoisting works. The ores now being extracted from shaft No. 1, 242-ft. level, are unusually rich. Fire assays of the sulphurets, that show no free gold, range from \$1,000 to \$1,500 per ton.

ST. LAWRENCE.—The St. Lawrence mine, near Ophir, the Hathaway lode, is being worked systematically under the superintendency of Chas. Purdy. The vein is strong, say from 3 to 4 ft., and heavily mineralized.

SANTA CRUZ.

HOOSAO.—*Sentinel*, April 1: The great amount of snow has seriously retarded the work, but a few men being engaged in developing the mine during the past month.

The mines in Newark Valley are reported to be in splendid condition; and we learn by letter from a party in that place, that the mill will be started up on Monday next.

RICHMOND.—Work still continues on the McGee shaft, the workmen being engaged in running the tunnel from the shaft to connect with the mine, which is still worked through the Lisette tunnel. The new ore dump being erected for the convenience of shippers in loading their wagons, is rapidly approaching completion. The furnaces are still idle, owing to the non-receipt of coal, the impossibility of which is caused by the stormy weather.

K K.—This mine is in excellent condition. The ledge discovered about two weeks ago, in the drift northeast of the Marcelina shaft, still holds out, and the work on the winze, which is being sunk through the solid ore, still con-

tinues. The drift east of the 3d level is advancing and is now in nearly 50 ft.

RUBY CONSOLIDATED.—About 30 men at work. Quality of ore found very good. The company will use coke at the furnaces this season, and will start them up as soon as the condition of the weather permits.

EUREKA CONSOLIDATED.—The company still receives enough coal to keep one furnace going. At the mine about 100 men are at work, which number is not one-half of the force usually engaged.

TUOLUMNE COUNTY.

BUCHANAN.—*Democrat*, April 4: This well known mine, incorporated some years ago as the Tuolumne Mountain G. and S. M. Co., capital stock, \$165,000, in 1,650 shares, was reincorporated last week as the Buchanan; capital stock, \$500,000, in 5,000 shares.

NEW ALBANY ONE.—We saw a large piece of rock from this vein, which was profusely adorned with free gold and sulphurets. Several tons fell from above, in the tunnel, a few days ago; the piece we saw was brought down as a sample of the "fall."

RIVERSIDE.—J. L. Murphy, superintending work at this mine, on the other side of the Stanislaus river, says a goodly quantity of ore is already out, that promises to pay well, and the mine looks very promising. He is getting the mill ready for crushing.

RICH POCKET.—L. K. Hough and Fred. Cope, of Garrote, for several months worked on the old Cosmopolite claim, making about wages, until two weeks ago they struck a pocket which yielded \$1,000 that day, and the next Thursday they took out \$1,200.

CHAPPAAL.—Samples of ore taken from this mine, located near Buchanan, are quite rich in gold, easy to be seen with the naked eye.

TRINITY COUNTY.

DOING WELL.—*Journal*, April 4: In the claim of Hump & McInnery, Weaver Basin, two men and a Little Giant are this season doing as much work as was done by eight men under the old system of "gouging." In fact, the only difficulty now is to get the dirt out of the way. A flume of a mile in length, with a grade of only 2½ inches to 12 feet, must be allowed to take its time. Want of fall is the great drawback to the hydraulic mining here in the Basin, but even with this great obstacle there is not a claim but that is paying, and paying well, too.

Nevada.

WASHOE DISTRICT.

OPHIR.—*Enterprise*, Apr. 4: Miners are now engaged at work calculated to open connection from the 1,300 down to the 1,700-ft. level. Good progress is being made in the several winzes and uprisings that are in progress for the opening up of connections from level to level.

GOULD & CUBAY.—The prospecting drifts on the 1,500 and 1,700-ft. levels are continued. On the lowest level (1,700-ft.) more rapid work is accomplished with the aid of three Burleigh drills.

IMPERIAL-EMPIRE.—Sinking below the 1,900-ft level is progressing at the rate of 2 ft. per day. Two winzes on the 1,700-ft. level, known as the north and south, still continue in favorable looking quartz.

HALE & NORCROSS.—The main drift on the 1,900-ft. level has been driven southward to the southern boundary, and is already extended into the Savage mine. The drifts already commenced in this direction have been delayed in their progress on account of the close atmosphere, and the vein has not yet been reached.

LADY WASHINGTON.—After the pumping machinery is ready for work sinking will be resumed in the shaft. When the shaft shall have attained a depth of 300 ft., a station will be opened and a drift started for the lead.

CALIFORNIA.—The drifts on the 1,300-ft. level from the Consolidated Virginia and Ophir mines are making very regular advancement. These drifts will be connected and the ventilation of the mine secured within one or two weeks from the present date.

CAWTON POINT.—The middle winze, 1,400-ft. level, has again reached good ore. The north winze, same level, is still in good ore; also, the east cross-cut still continues in good ore and has not yet reached the east wall. The daily yield of ore is 500 tons.

KNICKERBOCKER.—The main shaft is down 515 ft., 15 ft. having been made this week. They now hoist the water out in a tank.

THE GOLDEN EAGLE.—Work has been resumed on this mine and the ledge between the shaft and the main tunnel shows a fine quality of ore. A powerful engine has been contracted for from the firm of Sellers & Co., Pittsburg, Pennsylvania, to do the hoisting of the mine.

LEO.—The rich deposit of ore found in the tunnel is holding out well. The winze now being sunk in it will in due time develop the deposit and define its course and extent.

UTAH.—On the 400-ft. level the work of development is vigorously prosecuted. The drift running south is 40 ft. from the main west cross-cut in vein material. The raise from this level is 60 ft. above the track floor, and is making rapid progress.

CALEDONIA.—The drift lately started west from the station is making good headway. The winze from the third station level is down 82 ft.

GOLDEN FLEECE (PEAVINE).—Three shifts of men are employed and the work is being pushed ahead day and night. The rock in the face of the tunnel is growing harder, which is thought to indicate that they are now nearing the ledge.

SILVER HILL.—The foundrymen and ma-

chinists are actively engaged in finishing up the new machinery, and it is thought that the works may be started up again next Thursday.

BELCHER.—The ore breasts on the 1,400-ft. level are showing exceedingly well as they are opened out. The main east drift on this level is in 358 ft. and the face is in ground which works well. The main incline below the 1,400-ft. level is down 156 ft. in hard blasting ground. The daily yield of the mine is 550 tons of ore.

ANDES.—Main west drift is now in a distance of 140 ft. The rock continuing very hard and requiring constant blasting the progress is necessarily very slow.

UNION CON.—Good progress is being made in the drift running into this ground from the 1,300-ft. level of the Ophir.

BALTIMORE CON.—The rock in the bottom of the shaft has changed and is now in material more favorable to rapid progress in sinking.

YELLOW JACKET.—Good headway is being made on the incline. Prospecting is still going on in the several drifts and cross-cuts on the 1,400 and 1,540-ft. levels.

SEO. ROCK ISLAND.—A body of favorable looking quartz has been found in the east cross-cut from the north drift. The main north drift in the direction of the American Flat is being pushed forward.

JULIA.—Still drifting southward on the 900-ft. level, encountering ore of a very fair character.

ALHAMBRA.—No work is now being done in the shaft. The business now in hand is the erection of hoisting works and the setting up of the machinery.

NEW YORK CON.—Re-timbering the main shaft will be completed by Monday. All the surface work will be completed and the new machinery in running order by the twentieth instant. About the first of May the work of sinking will be resumed in the shaft. The last 100 ft. in the shaft cut a number of very promising veins of quartz, which it is hoped will be found concentrated in one body at a greater depth. When the shaft shall have attained a depth of 550 ft. a station will be opened and a drift started for the lead.

OVERMAN.—Day before yesterday one of the rods of the new Burleigh compressor was broken, but it was found that working one cylinder furnishes sufficient air to run not only the hoisting engine at the winze on the 100-ft. level, but also a drill on the 300-ft. level. The winze is now down (measuring on the incline) 300 ft.

CHOLLAR-POTOSI.—The drift at the fourth station has been extended 12 ft. during the past week. During the week 600 tons of ore have been extracted from the ore-producing sections of the mine and shipped to the mills for reduction. The billion product for the month will exceed \$80,000.

WOODVILLE.—Good progress is being made in the erection of the new mill.

JUSTICE.—The rock in the bottom still continues to be a mixture of porphyry, clay and quartz.

EUROPA.—The winze is down 38 ft. Ground works well. Will make a cross-cut into the lead when the winze shall have reached a depth of 50 or 60 ft.

ALPHA.—The indications are about the same as last week.

LADY BRYAN.—The new shaft has attained a depth of 55 ft. As yet they are not troubled by any influx of water.

MONTEZUMA.—Ore is being encountered which is being saved with the intention of having it milled.

SUTRO.—Still pumping, with some decrease of water noticeable during the past three days.

TYLER.—Main shaft down 240 ft. Rock in the bottom working well.

SIERRA NEVADA.—*Enterprise*, April 4: The shaft is now down 310 feet. No increase of water and the rock blasts well. The work of excavating for the foundation of the new hoisting works is about one-fourth completed. About 20 men are now engaged on this work. The hydraulic works will be started up about the 1st of May.

CONSOLIDATED VIRGINIA.—The main shaft is now sunk and timbered to a considerable depth below the 1400-ft. level. On the 1,400-ft. level the drift from the shaft is already 100 ft. south of the station. The drift from the winze on the same level is now in 48 ft. The Occidental and the Sacramento mills, of a monthly reducing capacity of 3,000 tons, will assist this month in the production of bullion.

SAVAGE.—Connection with the Hale & Norcross, by means of a drift on the 1,900-ft level, will be made to-day. The west cross-cut on the 1,900-ft. level, back of the station, is now in a distance of 135 ft.

Arizona.

MORE GOLD.—*Miner*, March 28: Mr. Geo. Heintzelman arrived in town last night, from Big Bug mining district, with about seven ounces of gold dust, which he sold at the rate of \$18.25 per ounce.

We saw to-day, at the store of L. Bashford, nearly \$1,000 worth of gold, taken from the placers in the past few weeks. Head & Co., Campbell & Buffins, Asher & Co., have each about as much.

RICH ORE.—Mr. Marcens, of Antelope, has recently taken a lot of very rich ore out of his mine, the Marcens. He is now arranging said ore.

The five-stamp mill of Mr. Stanton is coming from California. It is to work the Great Sexton mine near Antelope.

MANY miners have gone, and more are talking of going, to Humboldt district, which lies south of Bradshaw.

White Pine.

Past, Present and Future.

The following article appears over the signature of "A. C.," in the White Pine News. White Pine at its birth, six years since, was a prodigy. The chloride ores of the Hidden Treasure and the Eberhardt were unknown to the North American continent, and had a parallel only in the Charnacello and kindred Chilean mines. Their richness running into the thousands, and their docility extending nearly to assay value, excited the greed or interest of all within hearing. These, together with the misapprehensions of their extent, caused by the profuse exhibition on Chloride and Bromide flats, inflamed the public to a degree unknown since the birth of California. Electrified by the prospect of interminable wealth, multitudes took their lue of march for the new Mecca, and so great was the hegira, that indifferent to sickness or climate, within the first season some ten or twelve thousand men had established themselves in huts and caves, nine thousand feet above the sea. All locomotives were in requisition, from shanks' mare to the impromptu coach, and teams groaned under the burden of subsistence for the pilgrim army. In the midst of the small-pox, with the thermometer at zero, a carnival of riot and speculation was inaugurated; mines, lands, wood and water were claimed, towns were built, lots rose to the thousands, and mining claims, good, bad or indifferent, were bought and sold at unconscionable prices. Toll roads were located, the postoffice and Wells Fargo's Express established, and the Bank of California not only contributed a branch, but some of her most enterprising operators. The motley assemblage of miners, experts, speculators, three-score and ten lawyers, and roughs, were a tumult, but each and all sedulous in his vocation. Thirteen thousand mining claims were located, many of them in conflict, from the ignorance or knavery of their owners, titles were adjudicated pell-mell, by the aid of experts and their profusion; many of the suits terminating at the exact period when their seeming worthlessness was demonstrated. A dozen mills were erected on the presumed extent of the chloride ores, and what were called the base ores were scoffed at as worthless, and not provided for in the category of reduction.

With few exceptions, no serious efforts were made to explore the mines. The absorbing idea was a sale, and a failure to accomplish this was a signal of apparent abandonment. A few pounds of ore and a barrow full of rock were tokens of ownership, that unfortunately extends to the present time, preclusive of subsequent legitimate labors, that in hundreds of cases would have been instituted. Within a short period, attention was attracted to the smelting ores of the district; and, in consequence, some thirteen furnaces started up like mushrooms, and, like mushrooms, vanished; devoured by insufficiency in construction, and by the inexperience of their operators. Earthquakes are seldom, and not prolonged. Excitements, however violent, must subside, and to a point beyond the normal one.

A revulsion followed the excess in White Pine. The speculative miner and operator, unable to realize \$20,000 for a hole in the ground, withdrew; and, to account for his recession, had to disparage the district. The Chloride Flat man, bottoming his shaft in the shallow intercalated masses of Treasure Hill, ignorant of the origin of these ores, joined in their criminations; and, loudly declaiming against the existence of true veins in limestone, took up his blankets and "walked." The excess of mills over explored chloride ores, the failure of the furnaces from improper materials and lack of knowledge of their owners, the non-appreciation of the base ores, conspired to depopulate the district, and it snubbed on the mischiefs it had unwittingly inflicted on Belmont, Antsin and Virginia, and to which a short future may impose on Pioche.

Fire has lent its flaming aid to depopulation and depreciation, by the destruction of two mills, and the chief part of Hamilton; but, in spite of these calamities, a review of the present, when made with judgment and dispassion, is not hopeless of the future; on the contrary, it "should cheer but not inebriate." The mountains have not been removed. We have three of them, obliquely parallel to each other; they aggregate nineteen miles in extent, and no observant men can be skeptic enough to deny their reeking with ore—ore of all the valuable varieties—save tin and platinum, and requiring the various modes of reduction. The chloride ores are confined to the summit, south and northwest ends of Treasure Hill, while the complex and leaden ores are distributed on its sides and over Babylon Hill and White Pine Mountain. Blue Hill alone would make a respectable rival to ordinary mining districts; but, when the whole of the mountains are comprehended, with their numberless rich mineral crops, the district is peerless; and, without any claim to prophecy, it is as safe to premise a silver future as to declare a sad past. The Chloride Flat fiasco will be understood when it is shown that the unreliable beds of ore were the natural outflow of superabundant veins, that near the surface found it easier to uplift the rocks than to rupture them, and hence the superfluous chloride ore flowed into the intercalated spaces. When the bedding rock is searched for fissures they will be found; and, when wrought, will develop into a system of metallic lodes, that will amply restore the repute of the Chloride, Bromide and Pogonip Flats and

disabuse the cavilers against metalliferous limestone. Intermediately, these eorners can have a full field on the west side of White Pine mountain, where the three formations, mined in Eastern Nevada, are rife; they can there delve in slate or quartzite, or gratify a penchant by digging in granite.

There are now in the district nine quartz mills, with one hundred and sixty five stamps, and a fifty ton tailing mill, capable of a daily reduction of 200 tons, which could be readily supplied from existing sources, and tripled, if ten per cent. of the ventures now made at Pioche or Virginia were had. This could be done without trenching on the base ores requiring a modified treatment, or the leaden ores legitimately due the furnace. These last furnish a vast reservoir from which wealth will flow, making the district as conspicuous for the amount and value of its base bullion as it is now for the docility of its ores. The knowledge acquired, since the discovery of White Pine, of furnace construction and fluxation of ores, ensures a success that will wipe out the disgrace of an early defeat. Bull run will be forgotten in the "march to the sea."

The Aurora lode, two and one-half miles in length, and 75 to 100 feet in width, abounding in rich chlorides, has been explored only for 3,500 feet, to a depth of less than 300 feet, and now presents an expanse of ore that proclaims a future rivalry with the Comstock. This is not a solitary reliance, though it promises to be a gigantic one, as the Eberhardt will again exhibit its millions, unless all mining history is a cheat and a lie. No rich creasing exhibitions can be followed by perpetual barrenness. The original fertility will, from time to time, recur, and reward bountifully the persevering operator. Charnacello, Grass Valley, the Comstock,

A True Statesman.

The decease of Hon. Charles Sumner, at the age of 63, has been marked by the sincere sorrow of the nation. We have too few, among living politicians, whose conduct is governed by purely honorable motives, not to regret deeply the loss of one whose character has been beyond assaunt. Whatever mistakes Charles Sumner committed, and in whatever personal collisions he may have been involved, no one dared to impugn his integrity. During his career as a statesman, Mr. Sumner had constantly to face embittered attacks from political opponents on all sides, whom his unflinching determination had stung into enmity. No man of any strength could have lived amid the stirring events which have occurred during our national history without making enemies, and bitter ones. Even Washington, who was one of the very few men who met with appreciation during their lives, was attacked in the same manner.

Sumner first came to the front during the excited sectional debates which preceded the attempt to dismember the Union, and his firm, unwavering course, through all those anxious days, did much to inspire confidence among loyal men, while it naturally made him a mark for the personal abuse of the secession party, culminating in the disgraceful attack upon his person.

Mr. Sumner evinced a remarkable aptitude for his work as a statesman. He was well versed in the intricacies of international law, and had a long experience in the councils of the nations. His merits were so conspicuous that he was often called upon to assume the

CHARLES SUMNER.

and hundreds of Mexican mines have had their preludes of dissolution, but survived to a long life of usefulness, under energetic management. The Pocotillo will be restored by shafting at the original opening, the early riches of the Virginia will be recovered, the Sunbeam requires only an additional blow, while the Grant & Colfax, the Copper Silver Glance, the Imperial and fifty others will expand into capable and valuable mines under persistent exploration. The Trench, the Caroline and the Mobile illustrate the advantage of regular and systematic working. Not only self-supporting, they accumulate capital in means and ores, and, at the same time, demonstrate increased breadth and fertility in their veins. On an earnest and unprejudiced scrutiny of all the conditions of the district, it is impossible to forbode other than a success to a renewed and energetic effort, and the only possible shadow to be cast, would be an apprehension of a lack of fuel for comprehensive workings. This, it is to be hoped, will be dissipated by the offerings from the Paucake and, possibly, from the Mokomoke mountains, as well as from a future connection with the Central Pacific railroad. Nature has indicated the route, and when White Pine has culminated to her natural importance the road will readily be built.

RICH STRIKE.—The vein of rich ore found in the Leo mine, Gold cañon, a short distance this side of Devil's gate, mentioned in our last regular mining report of Thursday, has since developed into a strike of considerable importance. It is in the face of the main tunnel or adit running into the hill, following the ledge, and has widened to about two feet in width. It came in at the bottom of the drift, and has raised now nearly to the top. The greater part of it is a soft black ore, which assays as high as \$5,000 to the ton, in gold, it containing but a small proportion of silver. In fact, both fine and coarse gold is easily and plentifully washed or "horned" out of it. This rich streak increases in size and richness and promises to develop into a good sized body or chimney of ore. Mr. Moyle, the superintendent, feels quite elated over his success, and, of course, is carefully securing all of this good ore for future reference.—*Gold Hill News.*

more responsible duties of the Senate, and served upon the most important of the Senate committees.

But it would be purely gratuitous to dilate upon the worth of a man so well and widely known. Suffice it to say that our country has suffered an irreparable loss, a loss which will be felt by all who have heard the name of Charles Sumner.

PROVIDING AGAINST COLLISIONS.—A correspondent writes to the *Scientific American*: It seems to be more dangerous now than ever to go to sea, as vessels are so much more numerous, and sailing so much faster causes a great increase of danger. Is there not a remedy? I think there is. I believe the Ville du Havre and Loch Earn might still have been afloat if they had been provided thus: Put a chain of the same weight as the anchor chain around the ship outside, supported by iron brackets with rings in the ends of them to pass the chain through and keep it in place. These brackets or chains supporters should be 18 inches long and from one to four feet below the main deck, according to size of ship, and about eight feet apart. Large passenger steamers might have two such chains, one one foot below the main deck and the other four feet below it. Such ships, in colliding, would have to break or pass through the chains before making holes in each other's sides. Level with main deck, have two beams, running out from eight to 15 feet beyond the cutwater, one on each side of cutwater, eight to 12 inches in diameter, so constructed that, when they come against a vessel or any outside object, they would yield and spring back slowly to within a foot of cutwater.

MINT OPERATIONS.—The Director of the Mint reports the coinage at Philadelphia, San Francisco and Carson, exclusive of minor coins and bars, during March as follows: Gold coin, \$4,216,400; trade dollars, \$4,845,485; subsidiary silver coin, \$127,085; total, \$9,188,970. Of the above amount, the mint at San Francisco coined over \$3,600,000 in gold, and \$250,000 in trade dollars. Orders from Japan and China for trade dollars are still increasing, and the mints are kept busily employed supplying the demand.

The Copper Interests.

While searching for the more precious metals of silver and gold, we are led to ignore the riches contained in the immense amount of rock bearing copper ore which abounds in our adjacent mountains. There are several well developed properties of this nature on White Pine mountain, one of which has been patented by an eastern company, and will probably be worked the coming season. The value of this article is becoming enhanced daily, and by the reports from the leading markets of the world we read that its scarcity is being made a subject of remark. The Lake Superior copper mines, which have heretofore produced a great proportion of the metal, are said to be becoming barren, or so much so as to render their working unprofitable. Also mining in other portions of the world is fast losing its former profitable character on account of the increased expense of extracting and working the mines. In view of these facts, copper speculators are commencing to turn their attention to hitherto neglected properties in search of a supply of the article, and if we do not advertise our country in this particular we cannot expect them to hunt us up. Not only in this district are favorable evidences of the existence of copper in large quantities, but also in the neighboring district of Robinson a great extent of country has been successfully prospected, showing indisputable evidences of permanency and quantity. This mineral, as found elsewhere, is generally but slightly tainted with silver or gold, but in the case of the district last mentioned both these properties exist, sometimes to an astonishing degree. One would be astonished on visiting the locations already made and now being worked more or less, at the vast extent of the croppings traceable over the country, and would be astonished why more capital has not found its way thither. Some will say that the work done has never proved remunerative to the owners, and why? The great distance from railroad communication and thence to market, causing enormous expense in transportation, united with the necessities of the usually poor shippers, requiring them to sell at reduced rates to moneyed men, and the various and inexplicable loss in weight, etc., between the points of departure and arrival, all operate to our disadvantage. We require men of capital who will come among us, extract the ore, erect their own furnaces, and ship the matted copper to the best markets. The profits arising from this valuable branch of industry will be apparent both to the poor and rich. Nature has done her best to make Eastern Nevada the miner's paradise. All that is needed to unlock her hidden treasures is the magic key of money. We are aware of several parties who intend visiting this section as soon as the snow goes off sufficiently to allow an inspection of properties to be made, and we are confident our advice will be acted upon and comprehensive development be at once commenced. In the mean time our mining friends must not frighten moneyed men away on account of extravagant and exorbitant prices.—*White Pine News.*

A GREAT FEAT IN STONE SAWING.—One of the stone saws of Messrs. Emerson, Ford & Co., 28 inches in diameter, carrying 14 steel chisels, making 22 revolutions per minute, recently cut lengthwise through 9 blocks stone each measuring 4 feet 6x10x10 inches. The saw cut 1 inch ahead at each revolution—1 foot per minute. The 9 blocks were cut in 87 minutes, being 28 feet of linear cutting and 56 feet of surface. The machine was driven by a four-inch belt from a 12-inch pulley. A fresh set of chisels was inserted for each block, the time occupied in changing being two minutes for each shift. The chisels weigh 200 to the pound, and cost half a cent each. The cost of splitting the 9 stones was \$1.50, power included. The stone was a hard, chert-gritted sandstone, much used in Pittsburg for building purposes; and 45 cents per superficial foot is paid for hand dressing the same stone.—*Manufacturer and Builder.*

ARIZONA MINES.—The "Oro Blanco," a mine close to the Sonora line, is claimed by some Mexicans, who say that, should its American owners attempt to take possession of the property, the State of Sonora will forward march against them. Mexican bluster, this. The Americans who lay rightful claim to the mine had better take some white friends down there, show the white of their eyes to the Mexicans, and settle the business. The *Citizen*, from which we learn these things, informs its readers that the disputed mine is rich in free gold; that its American owners agreed to permit a few Mexicans to arastras from it, but never agreed to allow troops of Mexicans to squat upon and rob it, which they are now doing.

FROM PANCAKE.—Col. A. Lewis arrived from the coal mine at Pancake late last evening. He informs us that the machinery is all up and working in a satisfactory manner. The north incline is down a distance of 150 feet, following the vein which still preserves the same width, being from four and a half to five feet wide. Ten men are at work on the mine at present. According to the estimates of surveyors, and experience in sinking other shafts, the water-lie is expected to be struck at about 210 feet from the surface, when it is thought a sufficient quantity of coal will be found to use in making coke for smelting purposes.—*Eureka Sentinel.*

USEFUL INFORMATION.

Horse-Hair.

So greatly has the change of fashion increased the demand for horse-hair during the last ten years, that, although the supply has greatly augmented, it has been so far beneath the requirements that the price has risen fully fifty per cent. We depend on South America chiefly for this article. For it is sacrificed the tails and manes, if not the lives of an enormous number of those wild horses which roam in such countless hordes over the far-stretching plains, which are the great physical feature of that continent. We obtain also no small quantity from Russia, the product of many horses which abound in the Tartar-inhabited steppes of Siberia. To this is to be added what is gathered from our horses at home, which, though superior in quality, bulks very small when compared with what comes from abroad. During the last few years our imports of horse-hair have amounted to about 720 tons. A large amount, no doubt, yet nothing as compared with the quantity of manufactured hair sold, much of it, too, at a far lower price than the raw horse-hair had cost. To understand these apparent anomalies we must be acquainted with the process by which curled hair is produced.

Before horse-hair is fit to be used for bedding, it has to go through several processes, each of which requires the application of considerable skill. In the mass it is lumpy, dirty and of diverse qualities; it has, therefore, to be sorted according to strength and color, and afterward passed through a mill, which opens up the lumps, and frees it from dirt and extraneous matter. It is then prepared for the hands of the curler, who, by the aid of a machine adapted to the purpose, twists it into a hard-knotted rope. It has afterward to be thoroughly soaked or boiled in water, and baked in a hot oven, which, when opened out, gives it that durable curl which bestows on it the lasting softness and pleasant spring that render it so excellent a stuffing material.

To take out the supply of horse-hair, which, from the very nature of the esse, must always be limited, the hairy tufts at the ends of the tails of oxen are much used. The hair from these, though never so good as the best which the horse yields, is quite equal to the ordinary qualities; and that it is of great utility is evident from the fact that, although an immense quantity is collected at home, an average of 180 tons is annually imported.—*Cabinet-maker.*

Burning Bricks with Non-Explosive Oil.

A subscriber states that the saving in burning by this method is not less than 33 per cent. One hundred dollars worth of oil will burn 60,000 hard burnt, beautiful facing bricks, and 40,000 hard burnt ordinary bricks, giving a brick equally burnt from top to bottom. End, side and heart of the whole pile all present the same hard burnt, beautiful looking bricks. There is no smoke, neither is there any soot or dirt arising from the fuel during the process of burning by this method; but one continual heat from the beginning until the bricks are sufficiently burnt. After the "water smoke" has passed off the bricks, the heat is regularly increased to any pitch which may be required; and in 48 or 50 hours, a regular, equalized, high pitch of heat is obtained, sufficient to melt cast or wrought iron if required, with little or no loss in burning, producing a hard unshaken brick, imperishable in water or atmosphere, and proof against change of temperature.

But in order to make a brick of this character, it must be borne in mind that all does not depend on the manner in which the bricks are burnt, whether with wood, coal, gas or oil. To make a brick proof against the changes of temperature, the first thing to be done, after it is ascertained that the material of which the brick is to be made is of the right quality, is to dig and cast up loose, in the fall of the year, as much stuff as it is intended to make into bricks in the following season, in order that the rain, snow, frost, thaw, and atmospheric air may decompose and mature every particle possible, and prepare it, ready for the tempering machine in the forthcoming spring.

Bricks, whether of clay or clay loam, prepared in this manner and burnt with non-explosive oil, are vastly superior, as to quality, beauty, and durability, to bricks made of immature raw material. There being neither smoke, dust, nor soot entering the kiln during the process of burning, the bricks, when taken from the kiln, have the appearance of newly planed small blocks of wood.

This method of burning bricks and other clay articles is most certainly destined to revolutionize the whole system of burning clay, throughout the whole of the United States.—*Scientific American.*

AN IRON FILTER.—Spongy iron is produced by calcining powdered iron ore with charcoal. Such iron forms a most excellent filter, more powerful, it is said, than even animal charcoal. It is said that even sewage water filtered through a layer of this substance is completely purified, and will remain sweet for almost an indefinite time.

It is said that if one part of sugar is dissolved in three parts of water and digested with one-fourth part of calcic hydrate, the resulting liquid will readily dissolve glue warm, and the solution will remain fluid on cooling, without having lost any of its adhesive properties.

Adulterated Pepper.

We are adverse to giving private information about any kind of adulterations, for the simple reason that such information may be turned to a bad account, while publicity is the best way to suppress this growing evil. The principal adulteration of the present day was first commenced in France and Germany, and accomplished with refuse material from potato flour factories, which are very common in Europe, but not here for the simple reason of the cheapness and abundance of all other kinds of flour. The dried particles of potato skin are pulverized and mixed with ordinary black pepper. The easiest way to distinguish this adulteration is the microscope or magnifying glass. Good pepper consists of black particles mixed with yellowish gray ones, giving a dark gray appearance, while the adulterating powder consists of uniform dark gray particles. The latter also floats longer on water than good pepper, and the color communicated to the water is also different in the two kinds of pepper. The adulterated pepper is also at first sweetish and afterwards burning to the mouth, notwithstanding it has a much weaker taste and odor. Finally, good pepper contains very little starchy matter, while this kind of adulteration is rich in it, as is easily detected by means of a solution of iodine, which colors starch blue. Other adulterations are pulverized beans, peas, and linseed cake; but these are very easily distinguished by the microscope, as well as earthy matters, which besides are easily separated by burning or calcination, when they remain behind. Also white pepper is often considerably adulterated with lime, chalk, soapstone powder, or starch. The purpose of all these adulterations is twofold; first, to increase the quantity directly, and secondly to improve the appearance of an inferior looking article. There are now in France two principal kinds of adulterated pepper, which Bonhardt, who investigated this subject thoroughly, calls "poivre léger" and "poivre blanc." The first is at present mostly adulterated with the potato skins named, the second with chalk, soapstone, starch, etc.—*Manufacturer and Builder.*

SALT AS A PRESERVATIVE FOR WOOD.—We may learn many things from the experience of others; but, unfortunately, we are very much inclined not only to overlook this, but even often to neglect the lessons of our own experience. The experience of many nations who possess an available seashore is, that timber immersed for some time in sea-water, before being sawed in the mill, is better, harder, and much more durable than if immersed in fresh water; and, in Holland, where very active shipbuilding has been going on for centuries, this fact is universally admitted, and its knowledge applied. It is also found that wooden piles driven in the sand of salt marshes last for an unlimited time. External causes of decay, such as dampness, may be made inoperative by the painting of the wood; but dry rot takes place, irrespective of the presence of paint, and seems to be due more to heat than to dampness. Paint only protects wood from atmospheric causes of decay; but the internal dry-rot can only be prevented by treatment of the wood when seasoning; and among the simple and cheap preventatives, salt appears to be the most available. It appears that, even after the dry-rot in timber has commenced, immersion in salt water effectually checks its progress and preserves the remainder of the wood. In the salt mines of Hungary and Poland, the galleries are supported by wooden pillars, which last unimpaired for ages, in consequence of their having become impregnated with the salt. Pillars of brick and stone, used for the same purpose, crumble away in a short time by the decay of their mortar.—*Car Builder.*

RESTORATION OF OIL PAINTINGS.—The linseed oil used by most artists contains 80 per cent. of linoleine, while the poppy oil contains 75 per cent. of that substance. This linoleine, acidified by exposure to the air, increases in weight 10 per cent., giving a hard transparent mass called by Mulder linoleine, which preserves the colors with which it has been used. To the picture when finished, varnish is ordinarily applied consisting of solutions of resins in turpentine or fatty and drying oils. If the varnish cracks, more is applied to fill up the pores, and several repetitions may have the effect of ruining the picture. The picture allows moisture to condense upon them, which is evaporated, and in process of time more is condensed, the result finally being a dulling of the picture. Indeed, the author states, that, by wetting a varnished surface with distilled water, and evaporating the water, wetting again, and again drying, a white spot may be readily made. M. Pettenkofer restores the brightness of the picture by exposing it to the vapor of alcohol, which, by condensing on the picture, causes a solution of the film of varnish, and thereby restores to the resin its uniformity. A varnish of balsam of copaiba, which dries more slowly than most others, is also found to act as a preservative. By way of preparation for the alcohol treatment, the pictures are washed first with water to remove dust, etc., and then with turpentine to remove the excess of resin.

Dr. SAGE, of Geneva, thinks that sodic acetate is far superior to common salt, and will preserve meat and vegetables in a condition much more akin to the fresh article.

GOOD HEALTH.

Meat-Tea.

Bogoslowsky has re-examined the theories of Kemmerich in regard to the action of meat-tea, which was supposed by him to depend wholly on the potash salts contained therein. Bogoslowsky says that Kemmerich used too large doses, and the fact that a rabbit can be killed not only by a large amount of beef tea, but by the salts extracted from a similar amount, proves nothing, except that both are (in enormous doses) poisonous. With small doses the difference is a marked one. While, for example, a rabbit was killed by the injection of extract of seven hundred grammes (1 pound and 10½ ounces) of meat reduced to thirty cubic centimetres (about one ounce), the ashes of the same quantity dissolved in thirty cubic centimetres of water produced, in another rabbit only a transient acceleration of the pulse, and the animal completely recovered. Nine days after, it died in an hour and a half after the injection of the corresponding quantity of meat-tea. It was shown that injections of warm water caused an increased rapidity of the pulse, but of meat tea, a much greater and more lasting acceleration. The salts hardly differ from warm water; or in larger doses, the acceleration may last somewhat longer. The author was able to produce these phenomena to a slight degree in his own person, but in another individual did not succeed. After large doses (ten, twenty, thirty grammes), in the latter case the pulse fell, while the thermometer was unchanged. After forty grammes gastric symptoms appeared, and the pulse rose. He concludes, as a practical result, that extract of meat is not so innocent a dietetic substance as is generally supposed, but always calls for care in its administration. (If Leibig's or any similar extract is here referred to, it would seem that the danger is not great unless the quantity used considerably exceeds that mentioned in the directions accompanying the packages.) In endeavoring to determine to what ingredient meat-tea owed the excess of its action over that obtained from the salts, Bogoslowsky found that creatinin, which exists in extract of beef in considerable quantities, when injected either into the jugular vein under the skin or into the stomach, produced a slight acceleration of the heart's beat, but he could not get any fatal effect.

From all which it appears that the stimulant action of ordinary doses of beef-tea is due partly to the warm water, the salts, and the creatinin. It would seem, however, from the observations last quoted, that the presence of creatinin is not sufficient to account for the difference between the action in beef-tea and the salts obtained therefrom. It is only in exceedingly large doses that the salts alone are sufficient to account for a fatal effect by their depressing action upon the heart. Leube has made use of the following method of preparing a solution of meat, to replace the complicated and costly process of Meissner with natural peptin, which is, besides, objectionable on account of the disagreeable taste and smell of the product. One thousand grammes of lean beef is placed in a porcelain pot, with one thousand cubic centimetres of water and twenty cubic centimetres of pure hydrochloric acid. The mixture is heated in a Papin's digester for ten or fifteen hours, and occasionally stirred. The mass is then rubbed down in a mortar to the consistence of an emulsion, and boiled fifteen or twenty hours more without the cover of the digester being lifted. It is then neutralized with carbonate of soda, evaporated to the consistence of a pap, divided into four portions, and dispensed in pots. The muscular fibres are broken up to a fine detritus, and the greater part of the albumenoid constituents is dissolved. The preparation is well borne and willingly taken, but it is better to use some other easily digestible food therewith, in order not to disgust by too constant use. The taste may be improved by the addition of Liebig's extract. The solution can be used in acute gastric ulcer and in chronic dyspepsia. It is supposed to give rest to the stomach by sparing it the labor of digestion, the albumenoids being already converted into peptones.—*Boston Medical and Surgical Journal.*

Real and Apparent Waste.

All is not waste that seems such. The time spent in the pastimes of childhood and youth is funded in health and strength, and a whole exchequer of delightful memories, on which the man or woman can draw at will. The time spent in school and for cultivation, is a splendid investment for all after years. The time taken out of business for needful rest and recreation is not wasted, but saved. The danger is not that we shall rust out, but that we shall wear out and break down before our time. The men who live on the jump, in a perpetual rush and whirl, as though an instant were an eternity and their fate depended on its use, are more wasteful of time than those who move to a slower measure and in more leisurely ways. The man who bolts his dinner as though he had a set of mill-stones in his stomach to grind the food he does not stop to chew, may save five minutes in a day; but he may lose hours of sleep and months in debility, and carry a shattered constitution to a premature grave. A distinguished physician has said it would be a wise economy for every business man to spend one year in ten in travel, or comparative leisure;

for what he would lose in that way would be more than added, with interest, to the length of life. Every literary man knows that the half days wasted on the beach or in the woods, in lounging about the shops, or out in the golden sunlight that covers the hills, often prove the most profitable periods of his life. The bankrupt millionaire touched a great truth when he said "what he had was swept away, and what he saved was lost; but what he had given away was saved." The days wisely wasted in recreation and beautiful fellowship and helpful charities, are most grandly kept.—*Herald of Health.*

Health Maxims from the Apocrypha.

The chief thing for life is water, and bread, and clothing, and a house to cover shame.

Better is the poor, being sound and strong of constitution, than a rich man that is afflicted in his body.

Health and good estate of body are above all gold, and a strong body above infinite wealth. There is no riches above a sound body, and no joy above the joy of the heart.

Death is better than a bitter life or continual sickness.

Give not over thy mind to heaviness, and afflict not thyself in thine own counsel.

The gladness of the heart is the life of man, and the joyfulness of man prolongeth his days.

Envy and wrath shorten the life, and carelessness bringeth age before the time.

A cheerful and good heart will have a care of his meat and diet.

Watching for riches consumeth the flesh, and the care thereof driveth away sleep.

Watching care will not let a man slumber, as a sore disease breaketh sleep.

If thou sit at a bountiful table, be not greedy upon it, and say not, there is much meat on it.

Eat as it becometh a man those things which are set before thee; and devour not, lest thou be hated.

Better is he that laboreth, and aboundeth in all things, than he that boasteth himself, and wanteth bread.

Sound sleep cometh of moderate eating; he riseth early, and his wits are with him; but the pain of watching, and cholera, and pangs of the belly are with an unsatiable man.

Whoso is liberal of his meat, men shall speak well of him; and the report of his good house-keeping shall be believed.

Show not thy valiantness in wine; for wine hath destroyed many.

Learn where is wisdom, where is strength, where is understanding; that thou mayest know also where is length of days, and life, where is the light of the eye and peace.

Whosoever is brought upon thee take cheerfully, and be patient when ye are changed to a low estate.

Be not insatiable in any dainty thing, nor too greedy upon meats.

Rise up betimes, and be not the last; but get thee home without delay.

Salt for the Throat.

In these days, says the *Religious Herald*, when diseases of the throat are so universally prevalent, and in so many cases fatal, we feel it our duty to say a word in behalf of a simple, and what has been with us a most effectual, if not a positive, cure of sore throat.

For many years past, indeed we may say during the whole of a life of more than forty years, we have been subject to sore throat, and more particularly to a dry hacking cough, which is not only distressing to ourselves, but to our friends, and those with whom we are brought into business contact.

Last fall we were induced to try what virtue there was in common salt. We commenced by using it three times a day, morning, noon, and night. We dissolved a large tablespoonful of pure table salt in about a half a small tumbler full of cold water. With this we gargled the throat most thoroughly just before meal time. The result has been, that during the entire winter we were not only free from coughs and colds, but the dry hacking cough has entirely disappeared.

We attribute these satisfactory results solely to the use of the salt gargle, and most cordially recommend a trial of it to those who are subject to diseases of the throat.

Many persons who have never tried the salt gargle, have the impression that it is unpleasant. Such is not the case. On the contrary, it is pleasant, and after a few days' use, no person who loves a nice clean mouth and a first-rate sharpener of the appetite, will abandon it.

MEDICAL VALUE OF ASPARAGUS.—A medical correspondent of an English journal says, that the advantages of asparagus are not sufficiently estimated by those who suffer with rheumatism and gout. Slight cases of rheumatism are cured in a few days by feeding on this delicious esculent, and more chronic cases are much relieved, especially if the patient avoids acids, whether in food or beverage. The Jerusalem artichoke has also a similar effect in relieving rheumatism. The heads may be eaten in the usual way, but tea made from the leaves of the stalk, and drank three or four times a day, is a certain remedy, though not equally agreeable.

GLYCERINE PLASTER.—A stiff plaster can be made with 150 grains starch boiled in one ounce of glycerine. A sedative plaster is made with three grains sulphate of atropia, two grains ceratrin, eight grains sulphate of morphia, one drop otto of roses, one ounce hard glycerine ointment.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Knox & Osborn's Quicksilver Furnace, 225. True latest man, 230. Value of Silver and Gold; Amalgamation of Silver Ores; Society of Engineers of California; Native Alloy on the Comstock, 232. Improved Threshing Machine; The Seattle Coal Mines; Academy of Sciences, 233. The Agassiz Memorial, 236.

ILLUSTRATIONS.—Knox & Osborn's Quicksilver Furnace, 225. Charles Sumner, 230. An Improved Threshing Machine, 233.

CORRESPONDENCE.—Mining in Plumas and Sierra Counties—No. 6; Glycerine in Mucilage, 226.

SCIENTIFIC PROGRESS.—Sulphuric Acid; The Oxhydrogen Light; Electrical Art; Wind and Currents; Odors, 227.

MECHANICAL PROGRESS.—The Largest Gun Ever Made; Agricultural Machinery; The Craceton Rock Drill; Pest and Petroleum; Improved Potato Digger, 227.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 228.

MINING SUMMARY from various counties in California and Arizona, 228-9.

GOD HEALTH.—Meat-Tes, Real and Apparent Waste; Health Maxims from the Apocrypha; Salt for the Throat; Medical Value of Asparagus; Glycerine Plaister, 231.

USEFUL INFORMATION.—Horse-Hair; Burnlog Bricks with Non-Explosive Oil; An Iron Filter; Adulterated Pepper; Salt as a Preservative for Wood; Restoration of Old Paintings, 231.

MISCELLANEOUS.—Platinum; A Curiosity; The Bladen Mines; Gold on the Yellowstone; Quicksilver, 228. White Pine; Rich Strike; Providing Against Collisions; Mint Operations; The Copper Interest; A Great Feat in Stone Sawing; Arizona Mines; From Panake, 230. The Gould & Curry Air-Compressor; Mining in Arizona; Mining Operation in Nevada; The Highest Mountains; Strange Phenomenon at Gold Hill; The Biggest Steamship Afloat—America Leads the World, 234. Placer Mining in Colorado; Deceptive Specimens; Inyo County Mines, 235.

Rotundity of the Earth.

In looking over one of that interesting series of pamphlets—"Half-hour Recreations on Popular Science," (Bancroft & Co.,) we came upon an item on the subject referred to. It seems strange that at the advanced stage of knowledge in which we now are, that any one should have returned to the old belief that the earth was a flat surface. But it seems that at even this late day there are some who still maintain this belief, as will be seen by the item to which we refer, which is as follows:

"A fruitless attempt has been made for some years past to induce the belief that the earth is a flat surface; and a Mr. Hampden, who seems to have been persuaded that it is so, rashly risked five hundred pounds on the issue of an experiment on the Bedford Level, in order to test the truth of the assertion. His offer was taken up by Mr. A. R. Wallace, and arrangements satisfactory to Mr. Hampden having been made, the experiment was tried by means of three disks, rising forty-two feet above the level of the surface of a piece of water large enough to show the curvature, if there were any. Therefore decided against Mr. Hampden, the central disk rising considerably above the line formed by the two outer disks, as seen from one end through a selected and approved telescope. The curvature to and fro in six miles to the extent of about five feet was proved."

A PROSPEROUS MINE.—"Jefferson" writes to us that the Legal Tender silver mines at Clancy, famous as the most important silver mines in Montana, are expected to produce this season more than triple the usual quantity of ore. The company have just completed the erection of machinery and steam-hoisting apparatus capable of hoisting 2,800 buckets in 24 hours. Work in the main shaft will be immediately commenced, sinking to and running out two new levels, both east and west, at a depth of 240 feet and 320 feet. In the 160-foot level are heavy breasts of rich ore. The stopes are yielding shipping ore worth \$400 per ton. The mining force will probably be increased to 100 men. Concentrating works are in course of erection. The company have on dump about 750 tons of ore preparing to ship to Freiberg, Germany.

Coal was last week discovered on the bank of Bear river, Placer county.

Amalgamation of Silver Ores.

Aaron's Method as Practiced in Mono County.

This method of amalgamation, introduced about five years ago, by C. H. Aaron, is a modification of the Mexican "fondo," and is somewhat similar to the "Chilian process," described a short time since in the Press. The latter, however, in which, according to the description, neither steam nor metallic copper is used, is not found to answer with the ores of Blind Spring district, which consist in great measure of "Partzite."

The ore is crushed fine, either wet or dry, and is amalgamated in barrels similar to Frieburg barrels, except that steam is introduced through the journal. From 15 to 40 pounds of sulphate of iron, about 50 pounds of salt, and from two to 10 pounds of iron borings are put with a ton of ore into the barrel. Also a quantity of copper in the form of balls or small bars. Steam is applied till the pulp is boiling hot, and then the quicksilver is put in.

The amalgamation, inclusive of charging and discharging the barrels, occupies from 12 to 24 hours, at the end of which the pulp is passed to the separators as usual.

The object of using sulphate of iron is to produce, with the aid of the salt, dichloride of copper from the copper contained in the ore. The dichloride of copper is the chief agent in this, as in the Chilian method, and if there were no copper in the ore it would be necessary to use bluestone.

An improvement, invented and patented by Mr. Aaron, consists in using a solution of sulphurous acid in water, in place of sulphate of iron, by which the dichloride of copper alone is produced, directly from the ore; while the sulphate of iron produces also protochloride of copper, which must then be reduced to dichloride at the expense of time and consumption of the metallic copper and iron turnings. It also injures such quicksilver as remains in the barrel at the time of charging. This improvement is not yet worked on a large scale.

The loss of quicksilver, which in the "fondo" is very heavy, it is claimed is now reduced, by proper arrangement of the settlers, to 1½ lbs. per ton of ore.

The results attained by this process are such as to tax the credulity of the San Francisco metallurgists, some of whom decline to believe that 90 per cent. is averaged in Mack's mill at Benton; but we are assured it can be done. Indeed, Mr. Aaron asserts that he has himself worked rich ore to 97 per cent. of the mint assay, and has averaged 85 per cent. on all grades from \$70 per ton upwards, with very imperfect means of crushing.

The mill above alluded to crushes the ore dry, through a 60-mesh screen, and works the barrels 24 hours. The Pioneer mill at Montgomery crushes dry, through a 40-mesh screen, works the barrel 12 hours, and extracts 85 per cent. Formerly this mill crushed wet in an arrastra, with results varied from 70 to 97 per cent.

Mr. A. B. Williams is now building a new mill at Benton, to work the ore from the Diana mine, and as he is a millman and mechanic, and has had several years experience with this process, he will undoubtedly produce first-class results.

If the ore were passed through a screen of 100 meshes to the linear inch, it is thought that at least 95 per cent. of the silver could be obtained from these ores; while the time consumed in working them in the barrel would be lessened.

From experiments made some years since, it appears that the ores of the Comstock vein can be worked to 90 per cent. with great care, by a slight change in the process, and the bullion would be fine; but as the process cannot be worked in pans, there might be some difficulty in getting it adopted, though the inconveniences of barrels will probably soon be surmounted by a new machine invented, and about to be tried by Mr. Aaron, which combines the mechanical convenience of the iron pan with the chemical possibilities of the wooden barrel.

THE FRENCH GUIANA MINES.—These mines, which a few months ago were attracting considerable attention, have not proved what was expected by the sanguine prospectors. A miner who has returned to Salt Lake City from French Guiana, gives a most discouraging account of his experience in that country. He says the climate precludes the possibility of successful white labor, and the stories of the richness of the gold placers are highly overdrawn. It would be a miracle almost for a North American to run the gauntlet of the poisonous water and atmosphere of the mining district and come out alive. Most of the Utah party are heartily sick of their venture, and are trying to get back. We did our best at the time of the excitement to warn miners about the climate of the country and its general unhealthiness, but some men are never contented unless they are looking up new fields; the further off the better.

The company organized last fall for manufacturing iron at Ogden, will commence building in a few days, and expect to have their works running by September.

Native Alloy on the Comstock.

On calling to return a book to our old friend and correspondent, Mr. Melville Attwood, we found him engaged preparing some objects for the microscopes; and on enquiry of what they consisted, he informed us it was the native alloy or argenteriferous gold of the Comstock lode. He had devoted much time to the investigation, and made numberless assays; and the result was, that he found the gold of that great lode occurred in the form of a native alloy—different from any he had ever heard of—and was composed of nearly equal parts of gold and silver. He showed us specimens taken from this lode to the north of Virginia and southward beyond Gold Hill, and from the croppings down to the deepest workings, all having the same character and composition. Mr. Attwood's researches prove to him that this alloy exists in all parts, and at all depths of the Comstock, in an unchanged form. The alloy is finely disseminated in, and intimately mixed with the mineralized silver, having the following characters: hardness, 3; specific gravity after melting, from 13.571 to 13.7; color, white, with a pale yellowish tinge; after melting, a grayish white, with a shade of yellow; contains 55.37 per cent. of gold, 42.87 of silver, and 1.74 of substances as yet undetermined. The great difficulty in getting a fair sample of the alloy, was in freeing it from the mineralized silver.

In Dana's System of Mineralogy, page 9, is mentioned an ore named Kustelite, viz: Auriferous Kustelite (1866) contains from 10 to 30 per cent. of silver; color, white to pale brass-yellow. There is a gradual passage to argenteriferous gold. (See gold.) The name Kustelite was given to an ore from Nevada having the following character: H = 2—2½. G = 11.32—13.10; color silver-white, somewhat darker than native silver on a fresh surface. Richer found in it silver, lead and gold, the first much predominating; from the lode of the Ophir mine, Nevada, in bean-shaped grains.

This is so different in character from that now under examination, that we think it can hardly be the same. As it appears, however, to be named after Mr. Guido Kustel, the able metallurgist of this coast, to whom California and Nevada owe so much, Mr. Attwood feels anxious that the alloy should still bear his name. Mr. Attwood is indebted to Mr. H. G. Hanks, for assistance rendered in checking the results arrived at in assays, etc. Mr. Hanks is now getting ready a paper for the Microscopic Society, describing the various forms of the mineralized silver found in the Comstock lode.

Value of Silver and Gold.

The basis upon which the value of silver is computed in the U. S. mint and its branches, is as follows: 99 ounces of pure silver is worth \$128 00; or 11 ounces of standard silver (900 fine) is worth \$12.80; hence one ounce of pure silver is worth \$1.29.23, and one ounce of standard silver is worth \$1.16.36. The premium or discount on silver varies with the supply and demand. One grain of pure silver is worth \$0.0026936; one ounce Troy of pure silver is worth \$1.292929; one pound avoirdupois of pure silver is worth \$18.5547; one ton (2,000 pounds) = 29,166.6 ounces Troy equals \$37,709.50; one cubic inch is worth \$7.15; one cubic foot is worth \$12,355.20.

It is presumed that many people do not understand the expression of "fineness" in connection with gold and silver. In speaking of bullion, what we usually call "fineness" is simply the weight of fine metal contained in a given quantity of mixed metals and alloys. For instance, in a gold or silver bar, which is expected to be 850 fine, it is simply meant that in 1,000 parts by weight, 850 are fine gold or fine silver, as the case may be. In our mint the value of gold is computed from standard weight; that is, gold which is 900 fine, that being the fineness of our gold coin as required by law. Of pure gold (1,000 fine) 387 ounces are worth \$8,000. Hence one ounce is worth \$20.67183-34625, and the one-thousandth part of an ounce, decimally expressed as .001 fine, is worth \$0.020671834625.

The gold of this State yields on an average 880-thousandths of the pure metal; that of Australia 925-thousandths. This of course varies greatly with the locality. We know of places only two miles apart where the gold from the upper mine was sold to storekeepers for \$16 per ounce, while that from the lower mines only brought \$11.50 and \$12 per ounce. The reason of this variation in value is very simple. The gold from the upper mines contained very little silver, while that from the lower contained a large proportion of silver, bringing it down in value according to equal weights. Fine gold 1,000 fine is denominated 24 carats fine. Gold containing two parts of alloy in 24 is said to be 22 carats fine. Jewelry is generally made of 18 carat gold.

METEOROLOGY.—As a strong argument against the terrible destruction of our forests, it has been predicted that the rainfall would fall off from year to year. California differs radically in many things from our Atlantic States, where this is an accepted theory. But we were not prepared to see this meteorological law so completely reversed in the Pacific States. This winter seems to proclaim that as our forests disappear our winter rains will increase.

Society of Engineers of California.

The Society of Engineers held their first ordinary meeting on Tuesday evening, at the Mechanics' Institute, President George F. Alhardt, C. E., in the chair. Those present, who had not already signed the rules of the society, did so, and Mr. Hanscom then read a paper on the objects and influences of the society and the duty of members toward it, which elicited an animated discussion on the many subjects of importance in engineering which should be taken up and ventilated by the society. Among these are our water supply, harbor protection, drainage, roadways, inter-communication by land and water, irrigation and kindred subjects of importance to the State.

The society is a new one and will be of great benefit to the members and the community. Mr. Hanscom's paper on the "Objects of the Society" was as follows:

"In reading the scientific and practical engineering journals of the day, one may wonder at the rapid strides which have been made in the increasing number of designs and constructions which are at any one time being developed and completed. From every quarter of the civilized world we read of almost countless projects in the various branches of engineering science which increase in boldness and utility, so that we may almost wonder where will science and skill finally reach. And at the present time the various journals are eagerly sought, for almost daily information as to some new and grand piece of construction, or the development of some wonderful design. Even the daily newspapers consider it important to chronicle in their telegraphic despatches the progress, almost step by step, of some new triumph of learning for the benefit of humanity. How many engineers have watched with the closest attention the reports, from week to week, of the construction of the East river bridge, from the caissons and their form and strength to resist the pressure of air, through all the various arrangements for placing in position—the removal of earth for a proper bed—the appliances for maintaining an atmosphere underneath in which men could live and work—to the gradual raising of the stone-work for its cables, which are to constitute one of the arteries of living New York, over which humanity will pulsate daily.

There is information for the architect, the hydraulic, and may we add pneumatic engineer, the gas engineer, the mechanical and civil engineer, each of itself requiring the most extensive knowledge and practice in its own particular branch; and I believe it is a fact that no engineering project in the world is looked upon with so much interest; and why? because from the experience developed in the construction of the undertaking. Scientific engineering knowledge is developed and disseminated in every place.

Thus we see that the grand effort is to obtain knowledge, and that so much the more is information imparted, so much is the standard of qualification raised among people of all classes and branches of professions. Can we not from this understand that the interchange of ideas, communication of thoughts and theories from study and practice, emulate and inspire us with more effort and intelligence to operate in our various positions in life? It is the natural desire for companionship that makes us agreeable in company, and a natural desire for information that makes two of a profession interchange ideas. By our gradual but wonderful means of rapid communication throughout the world we are all becoming familiar with each other, and by this means are mutually increasing our store of knowledge and daily applying new learned principles to immediate practice.

It is from such considerations that the effort has been made to organize and develop the Society of Engineers of California. All acknowledge its necessity and value; and not even those immediately connected with it, but the community at large. Who does not know the necessity of able and public discussion of the water supply of this city; or the gas; or the drainage; or railways? and do not all commercial men in the community recognize the importance of protection to our water front? And of no less importance is our communication with each other in the State by land and water.

Are not our agriculturists aware of the vital importance of irrigation in certain portions of our noble State? All these, and many others of much importance, are subjects on which one and all desire information; and here is the place for each to add his efforts for the benefit of others, from his study and experience. It seems a duty, then, that we owe each other, to give to all who may be interested such knowledge as we may possess, and can without injury to ourselves. How often do we in common conversation catch some new idea, which in some future time develops into a portion of some work which it seems exactly to fit. Then let each and all endeavor to bring some result of study or practice on his particular branch for the discussion and benefit of others, and we shall have a society which will be of value and honor to ourselves and the community surrounding us."

The paper on boiler pressures by Mr. Jamea Spiers was postponed on account of illness of the author, until the next ordinary meeting, which will be held on the first Tuesday in May. Mr. C. H. Lougee gave some very interesting accounts of his experience in submarine diving in China, in making examinations of the U. S. steamer Oneida, which was sunk in one hundred and forty feet of water. After which a general discussion took place until ten o'clock, when the meeting adjourned.

Improved Threshing Machine.

We illustrate this week a threshing machine constructed in accordance with patents issued to James T. Watkins, of Santa Clara, December 17th, 1872, and Mr. Watkins and Jasper E. Scott, also of Santa Clara, January 20, 1874. The improvements covered by the former patent are, briefly, as follows: The employment of a series of parallel slats, *b*, shown separately in the foreground of the wood-cut, arranged in the form of a comb in the rear of the threshing concave, which receives the straw from the cylinder and passes it to the apron, while the grain is allowed to fall through the slats upon the grain belt below. Just below this comb a shaft, *c*, passes across the frame, carrying a number of long teeth, which alternate with the teeth or slats of the comb. By means of a crank outside, the shaft can be turned so as to bring the teeth to a vertical position between the teeth of the comb, where they serve as a supplementary row of concave teeth, or it may be turned so as to disengage the teeth. A third improvement consists in a very ingenious device for regulating the blast of the fan. Two semi-circular plates, *e*, *e*, are pivoted, one above and the other below, so that by moving their opposite free ends toward each other or apart the opening can be made larger or smaller, as desired. Motion is communicated to these plates by rods, *g*, *h*, which connect the free ends of the plates with the ends of a lever, *i*; thus

The unthreshed straw is ordinarily fed into the throat, from which it is taken by the cylinder, by hand; this is a very laborious as well as irregular method, sometimes clogging and partially stopping the machine, and sometimes leaving it with too little straw, so that it will run too fast. The new feeder consists of the forks, *D*, *D*, each of which is operated by an arm, *F*, from a crank-shaft, *J*, which is driven by belt connection with the machine. *G* is a short upright post, secured on the top of the threshing. One end of each of the arms, *F*, *F*, is secured to a crank on the shaft, while its middle is provided with a curved slot, through which a pin passes into the post, *G*. A friction-roller may be placed upon the pin, if desired, to relieve the friction. The forward end of the arm is pivoted to the middle of the fork-handle, while one end of a connecting rod, *H*, is secured to the upper end of the handle, its opposite end being fixed to the upright post, *G*. As the crank shaft is rotated, the arms, *F*, *F*, will be moved back and forth, while the curved slot lifts and lowers the forward end, causing the fork to describe an oval track, and thus rake the straw down the incline to the cylinders. The forks, of course, act alternately.

This form of feeder also acts as a regulator, for the forks are always carried back at a certain height from the bottom of the throat, and if any masses of straw should be brought to them, they would force back the overplus, and only take a certain quantity forward. Their motion may be regulated by shifting the point of attachment of the arms, *F*, *F*, and rods, *H*, *H*, up or down along the fork-handles, causing

The Seattle Coal Mines.

A subscriber of ours, writing from Seattle, thinks that the press of San Francisco maintains a dignified silence with regard to the mineral interests of that section of country. He says that although they have no gold and silver mines, they have plenty of coal, a product of the earth quite as necessary as gold or silver. He says that they have a coal mine there which would buy all the gold and silver mines in California, if it was ever developed. He refers to the Rentan (?) coal mine. In speaking of it he says:

"Here is a mine worth speaking of, and its equal does not exist outside of Pennsylvania. In this mine there are four seams which will cut fifty feet of coal; another beauty of it is that at least 3,000 feet on each seam lays above the water level. Only think of a sheet of coal 50 feet thick, 3,000 feet wide and six miles long. This is quite a pile, and would keep all the gravel and quartz mills busy to pay for its product as fast as it could be got out at \$2.00 per ton. Millions of tons of superior coal only waiting to be dug out and put in the market, and no notice of it in the papers. Yet if a fair sized lead of quartz should be discovered in Arizona, California, or Nevada, how the ink would fly. You should not forget that there are other and more profitable metals than gold and silver to be mined. Here in this part of the

capitalists, and those who have made money out of them will be very likely to invest more, if it can be proven to them that there is a fair show to make a profit in the investment.

Academy of Sciences.

At the last meeting of the California Academy of Sciences, held on Monday evening, the following gentlemen were elected resident members: W. O. Gibbs, Manuel Aspizoz, Ferdinand Lantern, Rev. F. E. Shearer and George W. Deitzler. The donations to the cabinet were as follows:

Dr. D. E. Hungerford presented a large collection of shells, corals, star-fish, fish, two specimens of crustacea, vertebrae of shark, tortoise shells, copper ore, pearl fish-hook, etc., mostly from the Gulf of Lower California.

Dr. Marshall presented the cast of a mastodon's tooth, from San Mateo.

Capt. D. C. Woods presented the snout of a saw-fish, caught off the coast of Mexico, and a pair of cow walrus tusks, taken from the animal at Cape East, Behring's Strait.

Mr. W. G. Blunt presented a case of twenty-five species of eggs.

Mr. F. Gruher presented several specimens of stuffed birds.

Judge Ford, through Barry & Patten, presented the skull of a marine animal (not determined).

J. W. Michael presented a fossil sea lion's skull washed out of a clay bank of Chorro creek,

AN IMPROVED THRESHING MACHINE.

each part is actuated simultaneously. Another improvement is the adjustable tail-board (not shown), which is composed of several strips or boards, united together by straps or hinges, allowing it to be raised or lowered to any height desired by turning up or down one or more of the strips.

Instead of beaters, above the straw-carrier, one or more series of long teeth or fingers are employed, which, without beating the straw, gently pick it up and loosen it with a shaking motion, so as to release the grains and allow them to pass through the carrier. Over the upper straw-carrier are agitators, *m*, of peculiar shape, each being a metal rod, bent in a zigzag manner back and forth, and each two adjoining ones alternating. The gearing by which they are revolved is shown upon the outside. The resultant motion is undulatory, somewhat like a process of kneading. The inventors claim that agitators constructed of this form are superior to any other kind, because they do not heat the straw, but simply agitate it sufficiently to free the grain. The movement of the screen is effected by a link and crank, giving the desired shaking and jarring motion. The screw-conveyor extends across the lower end of the elevator, thus avoiding choking and clogging, and keeping the grain in motion so as to be distributed to the buckets of the elevator.

We regard the automatic feeding apparatus as the most ingenious part of the machine. The improvement in feeding devices is the subject of the second patent, dated this year. The inventors, after spending considerable time and effort in the attempt to produce a really effective automatic arrangement, devised and adopted the apparatus figured above the front of the threshing machine. They employ one or more forks, which are so connected with supporting and operating arms that they will, by suitable machinery, be alternately reciprocated back and forth in front of the throat of the machine, and feed the straw by a raking motion.

them to describe a greater or smaller oval, and thus adapt themselves to the requirements of the machine, because the larger the oval described, the more straw will be fed.

The machine is made throughout as automatic as possible, and the labor of attending to it is very slight. One of the inventors, Mr. Scott, who has lost the use of one leg, successfully managed one of these threshers entirely by himself, last summer, for an entire day, and attends to the engine, which drove the thresher at the same time. He found time to bring the straw to the machine, remove the grain and chaff, and regulate all the working parts, without difficulty.

THE DISCOVERER OF GOLD.—The California Pioneers, at their last meeting, elected James W. Marshall, the discoverer of gold in California, an honorary member of the Society. This reminds us that Mr. Weamer, who also claims to be the discoverer of gold, is still in the land of the living, although spoken of as dead some time ago by many of the papers. He is about to locate permanently in Phoenix, Arizona, where he has been to prepare a home for his family. Mr. Weamer still insists that he was the first discoverer of gold. He says that he and Marshall were standing near together when he—Weamer—picked up the piece of gold which Mrs. Weamer still has in her possession. The lady resides at Oamhria, California, and still retains the famous piece of gold.

THE CLARA BELL MINE, Bakersfield, Kern county, has a ledge a foot thick which will mill \$40 per ton. The Cinderella, with a two and a half foot ledge, will mill \$20 per ton. It is owned by Blade & Co.

THE CROWN POINT MINE has received a steel wire cable weighing 17,750 pounds—a heavy weight to raise every time a car load of ore is raised.

country we have iron as a close neighbor to the coal, and both of good quality."

"Iron Mountain if worked would bring more gold than has ever been dug on the Pacific coast, with the aid of the coal to work it, and in some cases both coming out of the same shaft. In the Seattle mines there is a mint of money waiting to be brought to light, and just in the shape we most need it. This coal has fallen into the hands of a lot of mining sharps, and a 'freeze out game' is going on while the mines are standing still. This coal should be sold in the San Francisco market at retail for \$6 per ton of 2,240 lbs. But that would be encouraging mining out of certain limits, and it seems to be the policy of the moneyed men of your city to encourage the importation of foreign coals rather than to help develop the rich and inexhaustible mines at home."

Our correspondent seems to entertain almost as poor an opinion of San Francisco capitalists as he does a high opinion of the mines he describes. There is little doubt that if he could prove his assertions about the mine he speaks of to any of them, that it would be quickly bought up. The trouble is with many men receiving the aid of capital, that they look at all the advantages of the situation through a magnifying glass and are totally blind to the disadvantages. They describe their mines in such glowing colors that the capitalists think they "smell a mice" and pay no attention to anything the owner may say. We hardly think that any of the San Francisco papers ignore either the coal or iron interests of this coast entirely. They are all anxious that coal deposits may be found which will enable us to work our iron, and are willing to do all they can to call the attention of moneyed men to favorable localities. The people here do not know much about coal mining, and, perhaps, do not want to put their money into a business they do not understand. All the coal mines on this coast are, however, worked by San Francisco

San Louis Obispo county, twelve miles from the coast.

Six specimens of ore from Utah and Colorado were received from ex-Governor Purdy.

Henry Edwards presented specimens of scorpions, tarantulas and lizards, collected on the Colorado river, Arizona.

H. G. Bloomer donated a specimen of the Australian Carpet snake.

From Mr. Button, two alcoholic specimens of lizard.

A specimen of tapa, or native cloth, from the Pacific Islands, varnished and of a peculiar pattern, differing from any in the collection of the Academy, was received from Mr. Raymond.

Mr. McHenry presented some fossil leaves from Seattle, Washington Territory.

Charles D. Gibbs read a paper on the "Reclamation of Swamp Lands," illustrated by diagrams.

Dr. Behr exhibited and described the nature of a species of mangrove, adapted to this State and found in New Zealand. He had, after considerable difficulty, procured some of the seed in a perfect condition, and was experimenting in raising the tree.

A technical paper on some tertiary fossils found in a well at San Diego by Henry Hemphill, was read on Professor Dall's behalf by Mr. Stearns.

Dr. Gibbs, Sr., made some brief allusions to the reported volcanic actions at Bald Mountain, which he believed were the results of chemical actions, similar to those at our own Geysers.

A circular from the Agassiz Memorial Committee was read, which is referred to at length in another column.

After some discussions relative to proposed changes in the constitution, the academy adjourned.

The quicksilver mania has taken hold of the Point Arenates.

The Gould & Curry Air-Compressor.

We yesterday visited the Gould & Curry, for the purpose of seeing in operation the Burleigh air-compressor which has just been set up at the works of that company. The machine was set up under the supervision of L. C. Parke, agent for the Pacific coast and Japan, of the Burleigh Drill Company, for their drills and air-compressors, and was set in operation for the first time, evening before last, about 5 o'clock. The compressor is a very powerful, compact and handsome piece of machinery. Combined with it and compactly fitted into the same heavy iron frame, is the engine by means of which it is driven. The air is forced from the two large cylinders of the air pump through a strong iron pipe into a receiver, standing a few feet from the machine. This receiver resembles a large steam boiler standing on end. From the receiver runs a strong iron pipe resembling a steam pipe; this goes down the main shaft of the mine and connects with the drills, engine, or whatever is to be driven by the compressed air. The compressor is a piece of machinery well worth seeing, easily understood when seen, but not easily described. We may state, however, that by a very simple arrangement a spray of cold water is constantly thrown into the cylinders in which the air is compressed, both cooling the air and cylinders and serving as a lubricant for the pistons. But for the jets of cold water thrown into the cylinders they would become so heated by the compressed air that they would eventually melt. Whatever extra moisture is thus forced into the air is condensed upon entering the receiver and is drawn off at its bottom. They were yesterday engaged in testing the main pipe, leading down into the mine, for leaks. By forcing air through the pipe the leaks were discovered, marked and afterwards stopped. They have on hand the drills (very compact and ingenious machines) to be worked by the compressed air, and will have them in operation in two or three days. As a miner said yesterday—"It 'pears like these 'ere air combusters is a-going into the mines most everywhere."—*Enterprise*.

Mining in Arizona.

Nothing but fierce Indian wars can now retard the mineral progress of Arizona, and these we do not look for, so long as Gen. Crook holds command of the small military force in the Territory. A very wet winter has aroused the old spirit of go-aheadiveness in the breasts of our miners, and, with prospects for the speedy erection of mills, furnaces, etc., miners and others reason that the future looks promising.

The fall and winter's working, with the 10-stamp mill at Wickenburg, the numerous arrastras in Yavapai, Pima and Mohave counties, the smelting furnace in Yuma, at Castle Dome, and the hundreds of rockers, sluices and hydraulic pipes, have more than satisfied all who were, or are, in any way, interested. The yield, in gold and silver, of all this working and of all these appliances, is not, of course, known with any degree of certainty; but, judging by the gold that has found its way to Prescott and then to San Francisco, we may safely set down the yield of gold and silver, since last Christmas, at \$150,000, leaving out of all question amounts still held by miners and the value of about 100 tons of ore shipped to San Francisco from Mohave and Pima counties.

Miners have now the assurance of three months' supply of water, and those living and working within a radius of 45 miles of Prescott will, in that time, take out in the neighborhood of \$100,000, as their claims are pretty well opened and quite rich.

At the end of this time, we confidently expect to see between 300 and 800 men in Bradshaw mining district, at work on the Tiger, Benton, War Eagle and other great mines there, as, by that time no less than three companies say they will commence active operations there. Mr. Wright, who left here yesterday morning, started away more than pleased with what he observed in Bradshaw district, and the general belief here is that his tribe will purchase the Tiger. Small matter, however, should they fail to come up to their agreement, as the agent of another company stands ready to purchase and work the mine, should Messrs. Ganahl, Wright and others see fit to crawl out of their "bonded" promise. A mine like the Tiger, that is traceable for miles; that has yielded ore worth nearly \$1,000 per ton; that has on its dump about 800 tons of ore, worth, at least, \$100 per ton; that has shipped 35 tons of ore to San Francisco, which netted the company over \$16,000; all of which ore came out of a shaft a little over 100 feet in depth, is not likely to go begging at this greedy time of the world's history. Another strong inducement is its location, in the midst of many other rich mines, and in a country where wood, water and grass are abundant.

Besides this show for mining life and activity, we have hopes that the Vulture company will soon do something; and our faith that the arrastras now being driven by water-wheels in Big Bug, Hassayampa, Walker and other districts will do well for their owners and the country is unbounded.

Going to Mohave county, we find that, since the fear of a long war with the Hualpais has faded, miners have gone to work as if no danger of this kind threatened.

The furnace recently erected at Castle Dome is just the trick to work much of the ores of Mohave county; and as the owners of said fur-

nace offer to purchase all ores which they can master, a market is thus opened to the miners of Mohave and other counties of the Territory. The boats of the Colorado Steam Navigation Company will stop and take on ores at any place on the river, so that there is now no excuse for idleness on the part of owners of lodes carrying argenteiferous lead ores.

Taken all in all, our Territory is not so ground down as croakers would make it appear. True, government contractors and some Indian agents are and have been doing all they can to ruin it; but, with Crook to keep it from being turned into an estate of the Interior Department; with our mining, farming, grazing and other resources; with the chances—now good—for the speedy completion of the Southern Pacific railroad, we are of the opinion that all true Arizonans can still defy the Devil, Columbus Delano, Gen. Howard, Dr. Tonner and Postmaster-General Creswell.—*Arizona Miner*.

Mining Operations in Nevada County.

The Nevada Transcript of March 27th contained the following:

Eighteen or twenty years since, Cement Hill was regarded the richest mining camp in this vicinity. An ancient river channel was found there which was cut by the Native American ravine. At a point where the ravine strikes the hill the ground was worked and found to be very rich; but after two or three years the lead was worked out or it could be traced no further. It remained unworked until about ten years ago, when E. F. Peck came into possession of it, and from prospects obtained and a thorough survey of the surroundings, he came to the conclusion that the ground which had been worked was only a section of the channel, which had been forced there by a land-slide, and the original channel lay further back in the hill, at the west side of the ravine. Acting on this theory, he commenced running a tunnel, eight years ago, for the purpose of finding it. He drove this tunnel 500 feet, but did not succeed in reaching the point desired. Last fall he made arrangements with a Mr. Foot, and started another tunnel. After running 300 feet he succeeded, without doubt, in finding the old channel, and it is the opinion of all who formerly knew the character of the ground, and those who have examined it since the discovery, that it will prove fabulously rich. The situation of the bed of gravel is said to be unusual, from the fact that 25 feet of soft granite bed rock overhangs the gravel. Other ground on the west has been located, and the County Surveyor will, to-morrow, complete surveys of the whole vicinity.

The gravel mines on the ridge are displaying a great deal of enterprise in the way of opening up their mines and making preparations for a thorough working of the ground that belongs to them. The Grass Valley Union says: "At French Corral, V. G. Bell is engaged in running a tunnel on the Milton ground through the hardest kind of rock which has cost \$86 a foot, and that, too, while using single-handed drills and giant powder. This tunnel will require about two years more to complete. Then he will be able to work the large tract owned by the Milton company with profit and system. At Empire and Kate Hays Flats, the miners are all busily engaged in preparing for a brisk summer's campaign—doing considerable blasting and some tunneling. At Birchville a busy scene is presented in the mining portion of the town. At Sweetland the Manzanita tunnel is in 3,000 feet and is as straight as an arrow—so straight that a candle lighted at the face can be seen at the mouth of the tunnel. It is regarded as a curiosity by all who have seen it. The grade is gradual and uniform all the way. It has considerable distance yet to run. It also is the property of the Milton company. The Sweetland creek mines are all doing well. At Buckeye Hill, George D. McLean, formerly a Grass Valley man, is washing and running the tunnel ahead at the same time. George has opened the mine systematically, and we understand it is paying well. A head of 1,000 inches of water is regarded as rather small at the Buckeye. This mine is owned by an English company. The Yuba tunnel comes next. They have been washing for some time. Last summer they were compelled to shut down because they could not get water. Their main pipe is 14 inches in diameter. The American mine is the next neighbor of Yuba tunnel, as can be noticed by the white stakes that show the boundaries. Their new tunnel is in 3,000 feet, and has some 2,000 feet to go. Their main pipe is 32 inches in diameter, which feeds five pipes—the largest of which having a six-inch nozzle. Thirteen under-currents are run by them to catch the gold. Davie & Bowen have been steadily washing since Christmas with 400 inches of water. Their working force is eight men. Smith & Buga have a small claim running over 200 inches of water, and are making good wages. At Montezuma Hill, two miles south of San Juan, the mine is being worked energetically and profitably. The main pipe is 6,000 feet long and 12 inches in diameter.

The Eureka Lake company are engaged in extensive mining at Columbia Hill. This company, during the past year, says the San Juan Times, purchased almost every foot of mining ground in that locality, and during the past fall and winter, mined extensively on what was known as the Richardson claims, close to the town of North Columbia. A clean-up of 30 days' run, the past winter, realized over \$20,000 over expenses, allowing eight cents per inch for water.

The Highest Mountains.

All the highest mountains in territory belonging to the United States are west of the Missouri river. Professor Hayden, the Government geologist, gives a list of more than sixty notable mountain peaks. In this list, only two are included in the Atlantic States, and these figure as mere pigmies by the side of the great mountains of the Pacific Coast. According to this authority, the highest mountain is not in California, but is really in Alaska. Two mountains in that territory figure as follows:

Mount St. Elias.....	FEET.	15,860
Mount Fairweather.....		14,789

But these are estimates, rather than the result of exact measurements. St. Elias, if the measurement does not shrink hereafter, is taller than Mount Whitney.

Mount Whitney, California.....	FEET.	15,000
Mount Shasta.....		14,442
Mount Tyndall.....		14,386
Mount Elmore.....		13,858
Mount Dana.....		13,227
Mount Lyell.....		13,217
Mount Silliman.....		11,623
San Bernardino.....		11,600
Lassen Butte.....		10,577

This is the best assortment of mountains to be found in any State in the Union. There are any number of mountain peaks ranging from 7,900 to 5,000 feet. But these make no figure among the giants. Colorado makes the following showing:

Mount Harvard, Colorado.....	FEET.	14,270
Pike's Peak.....		14,216
Irwin's Peak.....		14,192
Gray's Peak.....		14,145
Mount Lincoln.....		14,124
Mount Yale.....		14,081
Long's Peak.....		14,050
Mount of the Holy Cross.....		13,500
Horse Shoe Mountain.....		13,406
Silver Peak.....		13,350
Veile's Peak.....		13,455
Mount Anahuac.....		13,402
Mount Guyot.....		13,223
Parry's Peak.....		13,133
Mount Flora.....		12,878
Spanish Peaks.....		12,000
Mount Englemann.....		11,000
Mount Wright.....		11,800

In Oregon the following mountains are most prominent:

Mount Hood.....	FEET.	11,225
Mount Pitt.....		11,000
Mount Baker.....		10,719
Cascade Range.....		9,000

Besides Mount Ranier in Washington Territory, set down as 14,434 feet high, Mount St. Helen's, in the same Territory, although only 9,769 feet high, is put down as a volcano. In fact, there is not an active volcano within the limits of our whole territory, although the number of craters show that the volcanoes were active at no remote period.

The following tables show the most notable passes over the two great ridges of mountains that have yet been found:

Passes over the Rocky Mountains.

32d Parallel, near El Paso.....	FEET.	5,714
35th Parallel, near Albuquerque.....		7,472
38th Parallel, (Cocheco Pass).....		10,000
41st Parallel (Union Pacific Railroad).....		8,241
42d Parallel (South Pass).....		7,083
47th and 48th Parallels (Cade's Pass).....		6,044
47th and 48th Parallels (Deer Lodge Pass).....		6,200
47th and 48th Parallels (Lewis & Clark's).....		5,323
Flathead Pass (Northern Montana).....		5,459
Kutanie Pass (British America).....		5,000

Passes over the Sierra Nevadas.

Tejon Pass.....	FEET.	5,250
Walker's Pass.....		5,300
New Pass, to Owen's river.....		3,164
Mono Pass, to Mono Lake.....		10,700
Donner Pass (Central Pacific Railroad).....		7,042
Beckwith's Pass, to Pyramid Lake.....		4,500
Truckee Pass.....		7,200
Madeline Pass.....		5,687

Strange Phenomenon at Gold Hill.

About three minutes' walk, in an easterly direction from Main street, Gold Hill, there is to be seen a most wonderful phenomenon. The ground, either from an earthquake or some other cause, has recently split open for at least a quarter of a mile. The crevice thus created, starting at Fort Homestead, crosses the railroad track, and thence pursues a nearly southerly direction down the west side of the cañon, embraced between Fort Homestead and the hill beyond. It then crosses the cañon, and extends for a considerable distance up the west side of the hill last named. The crevice varies in width from one to twenty inches; and, in places, appears to be bottomless. The most interesting locality to visit first is directly east of Postmaster Chubbuck's residence. In going to the locality indicated, it is necessary for the visitor to cross the cañon named above. The crevice, or chasm, throughout its entire length, is as straight as an arrow, and is of recent origin. It was first discovered by our fellow townsman, Fleming, an old prospector. That it is something more than a land-slide is evident, from the fact that it crosses the cañon in a direction nearly at right angles to the same. Our reporter, who visited the scene of the earth opening, lost all traces of the same at the fort. It is possible, however, that it extends northerly as far as the Imperial works. The ground upon which the town of Gold Hill is built, seems to possess the element of instability; and in many cases, the water-pipes have pulled apart, and boiler beds have gone out of position, owing to this circumstance. The question—"Whether are we drifting?" is a pertinent one. Any person possessed of ordinary curiosity, or having a taste for geological investigations, will be richly rewarded by visiting the scene of the phenomenon referred to above.—*Gold Hill News*.

The Biggest Steamship Afloat—America Leads the World.

The "City of Pekin," a full description of which, and of the launching, is given below, is a steamship belonging to the Pacific Mail Steamship Co., and is next to the Great Eastern, the largest steamship in the world. The "City of Pekin" will carry 7,000 tons dead weight, besides passengers and coal; and if fully loaded with teas, her cargo would be worth two million dollars. The contract price for her was \$1,127,000, about the cost also of our Palace Hotel. The "City of Yeddo," now building, will be as large as the "City of Pekin." The following is the account of the launching, etc., dated Philadelphia, March 18th.

This afternoon, at six minutes past one o'clock, the "City of Pekin," the largest steamship in the world next to the "Great Eastern," was most successfully launched from John Roach's shipyard, Chester, 14 miles from Philadelphia. The launch was witnessed by thousands of persons, and it is looked upon as a great national event. The sea monster is intended for the Pacific Mail Company's line, and will run, together with the "City of Yeddo," of the same size, and nearly ready for launching, between San Francisco and Pekin, China, and Yeddo, Japan.

The launch was witnessed by several United States Senators, members of Congress representing nearly all the States, representatives of different State governments, and thousands of visitors from Philadelphia, New York, Washington, Baltimore, Wilmington and other cities. It was fully expected that President Grant would be present, but he was detained in Washington.

After the launch, a grand banquet was given in a spacious building in Roach's shipyard. Nearly 2,000 persons sat down to the table. Speeches were made by United States Senators Bogy, of Missouri; and Cameron, of Pennsylvania; John Roach, builder of the "City of Pekin" and "City of Yeddo," and others.

The dimensions of this magnificent steamship are as follows: Length of load line, 395 feet 5 inches; length over all, 420 feet; beam, 47 feet 4 inches; depth, 38 feet 5 inches; tonnage, nearly 6,000 tons. She is rigged with four masts, full ship rig, with fore-and-aft jigger-mast; has accommodations for 120 first-class, 250 second-class and 1,000 third-class passengers. Her engines are double compound high-pressure cylinders, 51 inches in diameter; low-pressure cylinders, 88 inches in diameter; stroke of piston, 64 inches, with propeller wheel of Hirsch's patent, 20 feet three inches in diameter, pitch 30 feet. Her hullers are 10 in number, and in length each 10 feet six inches, with a diameter of 13 feet.

The social hall, on deck 41 feet by 19 feet eight inches; the grand saloon, 120 feet by 48 feet. It is most beautifully finished in maple, satinwood and French walnut. It is lighted by 12 side-lights and two skylights. There are in the first cabin 50 state rooms, each with two berths, lounge and wash-stand, and lighted with side oval windows. Each room is six feet three inches by eight feet six inches, and are spacious and most favorable.

To the rear, along the passage-way, is the room of the stewards, bath-room and water-closet, and the ladies' toilet-room, lighted by stern windows.

The second cabin has on the starboard side the pursers' room, bath-rooms and water-closets, mess-room, kitchen, and the rooms of the store-keeper, cook, baker, porter, lamp and oil room, and the quarters of the hostess and carpenter.

On the port side is the gallery, oilers' room, the quarters of the water-tenders, second and third engineer, first assistant engineer, chief steward, chief engineer and surgeon, with three bath-rooms, barber-shop, wine-room, pantry and additional state-rooms, dispensary department, water closets.

The storeroom on the starboard side, has, in addition to the stowage accommodation, the hospital department, with five berths, butcher-shop and cattle pen. Forward, on the port side, are water-rooms, water-closet, and room for baker and cook, with passenger accommodations.

The forecastle has accommodations for 60 of the crew, and is more spacious than usual. Forward, on deck, is the pilot-house and chart-rooms. The quarters of the First, Second and Third officers are on deck, abaft, and fitted up with every convenience, including walnut furniture. The smoking room is also on deck. It is 19 by 15 feet, and handsomely furnished with lounges of walnut. Attached to the "City of Pekin" are the Captain's gig, 10 boats, and six of the largest sized and most improved life-rafts, forming ample means of safety to the passengers and crew in case of accident.

Seven rolling-mills in this State contributed the iron, the weight of which is estimated to be 1,000,000 pounds. The weight of the vessel is calculated at 7,000,000 pounds. When loaded to her full capacity, she will stand about 17 feet above the water line. We already have spoken of her engines, but may add that her horse-power is rated at 4,500. The furnaces will consume about 60 tons of coal per day, and the speed of the vessel, it is estimated, will be 15 knots per hour.

The saloon-cabin will be furnished and upholstered in the most elaborate manner, with plush and velvet carpetings. On the spar-deck we notice the steering apparatus, which can be used either by hand or steam. The masts are of the fore-and-aft type, and the windlass is arranged to be operated by steam or manual power. The anchors are of 5,500 weight separately, and are attached to 27 fathoms of two and a quarter-inch chain. She can avail herself of 3,300 feet of canvas.

On leaving our port she will be taken in charge by Captain J. Maurie, of the Pacific Mail Steamship Company, and conveyed to the Morgan Iron Works, where her hull and engine will be completed. The cost of her full completion. One million dollars in the estimated cost of this magnificent structure.

The workmen engaged in the mining and smelting in Prussia are united in a kind of self-insurance society, the object of which is the supporting of the sick, superannuated, widowed and orphaned members of the craft. In 1871 the union included ninety-one subdivisions, in which were enrolled the workmen from 2,445 mines, 183 smelting works and eighteen salt works, to the number of 101,813 regular, and 106,349 occasional workmen. The property of the union is free from taxation, and counting up all kinds of effects, amounted in 1871, to forty-two thalers four and one-third groschen per member, or about \$62. On January 1, 1873 the union was caring for 9,269 invalids and 277 "half invalids." During the year 1,413 invalids were received, and 1,501 were removed from the society's care, and 128 half invalids were received and eighty-four removed. The invalid age has before varied from the fifty-fifth year in 1861 to the 48-8th in 1868; but in 1871 it went just one step lower. It stood at the 48-7th year.

NINETY per cent. of the good lever watches sold in the United States are of American make, but there are large quantities of cheap watches imported from Switzerland and France.—*American Manufacturer*.

Placer Mining in Colorado.

UNION DISTRICT, SUMMIT COUNTY.—Summit county is pre-eminently the placer mining county in this Territory. A description, therefore, of its prominent placer diggings and their resources will be interesting.

The placer mines are situated in the southeast corner of the county, within an area of twenty square miles. The Alpina streams, whose sources are above timber line and which have a perennial supply of water that accommodate this area, are the Blue, Ten-mile, and Swan rivers, and French, Illinois, Indiana and Pennsylvania gulches. There is also a network of small streams, affording water during a portion of the season.

There is in the aggregate one hundred miles in length of good ditches fed by these rivers and streams. The more prominent of the ditches are the Gold Run, ten miles long, independent ditch, eight and one-half miles long, Blue river and Buffalo Flats ditch, six miles long, and the Green-leaf ditch, four miles long. These ditches have cost about \$1,000 a mile. In the flush days of '60-'62 the Georgia and Galena gulches, Hughes' Flat and Jeff Davis' Patch were the heavy producers of bullion, but they have since fallen into comparative neglect and disuse. But on the completion of the Swan river, Georgia ditch, and the construction of new ditches (in contemplation) higher up for the former two diggings, they will probably be worked again with good results.

Gold Run, which comprises what is now called Union district, was discovered in February, 1860. It has always been noted for its rich and extensive placer mines. But it was only partially worked until the completion of the ditches, in 1863. Since then it has yielded \$550,000 in gold, as follows: Buffalo Flats, \$300,000; Gold Run Ditch company, \$250,000; and the district remains comparatively unworked.

Mining is carried on in this district by bed-rock flumes, hydraulics, and the "booming" system.

We learn that the minimum yield to one hundred square feet is \$1,600, and the maximum \$16,000. There are several hundred acres in the diggings. The bed rock is slate, very soft, making it easy to clean and shovel up. The grade is from six to nine inches in twelve feet. There are comparatively few boulders to handle. With proper appliances and the water of the Gold Run ditch in one consolidated mining operation, over two acres of the diggings can be mined in a season. The mining season generally lasts six months, from the first of May to the last of October.

The diggings will be extensively worked the coming season.—*Colorado Ex.*

DECEPTIVE SPECIMENS.—Minerals are sometimes picked up hundreds or thousands of miles from their real home. Everybody has heard of cunning miners "salting" barren ground with specimens from mines at a distance. It is a common and often successful trick. Petroleum has been poured into natural springs, and the lands sold at a high figure. Holes have been dug on mountain sides and filled with wet coal-slack in winter, covered over, and afterwards cut down as coal-bed outcrops, to get a premium for the discovery. California nuggets have been dropped into Greene county oil borings, etc. But the same thing happens without fraudulent intention. A. W. Franks, Esq., exhibited at a meeting of the Society of Antiquaries, in London, November 28, 1872, a bronze pricket candlestick, four and a half inches high, "the stem of which issues from the body of a stag," apparently of the 14th century. It was found on the wharf at Calcutta, in ballast thrown from a ship from Erith, in Great Britain. Had this been a stone implement, or a piece of tin-ore, it would have escaped immediate observation, and being afterwards found by some curious observer, would have led to some archaeological or mineralogical mistake. No doubt, many such mistakes have occurred in all ages; for in all ages commerce has thrown the stones of one shore upon others far away.—*Railway and Mining Register.*

INTO COUNTY MINES.—A letter from Cerro Gordo, Inyo county, to the *Call*, gives some interesting information about that region of country. Cerro Gordo is nearly 28 miles due east of Mount Whitney, 260 east and about 100 south of San Francisco, and 27 miles east of Visalia. The writer was Sheriff of the county at one time, and frequently had to ride 150 miles on horseback to summon a juror. On the 17th of March, six years ago, he, in company with M. E. Belshaw and E. Jordan, started at Cerro Gordo, the first successful lead-smelting works on the Pacific Coast, which have been in constant operation ever since. Some 10,000 tons of lead and silver have been shipped from this place to Selby's works in this city, and two fourteen-mile teams are being loaded daily for Los Angeles, each team taking 340 bars, of 85 pounds each, at a trip. Although a hundred teams are employed, they are three months behind with the transportation, as the works have now 23,000 bars on hand.

The correspondent, who is no longer interested in the smelting works, says 300 tons of lead ore can be tumbled out at a single blast, and the ledge in some places is 200 feet of solid ore. The company is not incorporated, but the mine is owned and worked by individuals.

Cerro Gordo is 8,250 feet above the sea level. The winter has been very severe, not having thawed for eighty days. Shocks of earthquake are very frequent, but do little or no damage.

GRAND INDUSTRIAL EXHIBITION,

To be held under the auspices of the

MECHANICS' INSTITUTE

OF SAN FRANCISCO, CALIFORNIA.

Opening on August 18th, 1874.

The Board of Managers herewith announce that a grand Industrial Fair will be held in the city of San Francisco for 30 days, opening on August 18, 1874.

In view of the increasing commercial and manufacturing importance of San Francisco, its configuration to and close connection with the various countries bordering on the Pacific, the managers have constructed a Pavilion having a floor area of 150,000 feet, and have invited to it all who are disposed to come and exhibit. All exhibitors will be placed on the same footing. Motive power will be furnished free.

The building will be open day and evening, and every facility will be extended to exhibitors and visitors.

Application for space must be made without delay to the Secretary of the Board of Managers, 27 Post street, San Francisco, and all inquiries will be answered and information extended promptly.

No space can be secured unless applied for before the 20th of July next. A. S. HALLIDIE, Pres. 13v25-3m J. H. GULVER, Sec'y.

The Agassiz Memorial.

In removing Louis Agassiz, death has deprived us of one, who, for the last quarter of a century, has done more than any other person to stimulate in this country the study of Nature and a spirit of scientific investigation. Twenty-eight years ago he left Switzerland, his native land, for the United States, and became an American citizen. Those twenty-eight years he gave to unremitting labor in behalf of that higher education, which, by the public at large, was little understood. His interest was confined to no town or State, to no individual or class. He journeyed much; and, wherever he went, there his pupils were. He might have rested on the reputation he brought from Europe, and by lecturing and writing have made a fortune. Such a life, however, he would not, or perhaps could not live. At the age of 67 his brain gave way, and he died, leaving no wealth but his name, his example, and his works. It would not be grateful for the country, nor would it be for the country's interest, that Agassiz should pass away without a fitting memorial. Such a memorial can be made out of the great museum which he began and partially built, and for the completion of which he has left full directions. Completed, it would be a perpetual fountain of knowledge and a monument quick with his spirit. "Museum," a word that commonly suggests little more than a collection of curious objects, is scarcely an appropriate name for the memorial Agassiz ought to have. The museum he labored for is a presentation of the animal kingdom—fossil and living—arranged so as to picture the creative thought. The study of such a subject is the highest to which the human mind can aspire.

The Museum of Comparative Zoölogy at Cambridge is an independent establishment, governed by a faculty of its own. It was founded fifteen years ago by Agassiz, and has grown to its present large proportions under his hand. In connection with it is the newly established School of Experimental Zoölogy on the island of Penikese, endowed by Mr. Anderson, of New York. The system of instruction has the broadest character, and includes elementary teaching, as well as the highest investigations. The exhibition rooms are free to the public. Large sums have already been expended in bringing this National museum to its present condition. Its collections in several branches are superior to the British Museum or the Garden of Plants. To make such an establishment useful, it must have a large building and a considerable annual income for the payment of professors and assistants. To perfect the grand plans conceived by Agassiz will require at least \$300,000, of which about one third would be used in enlarging the building, and two-thirds would be funded.

It is proposed to raise the money to complete this work, and a committee composed of scientific men has taken the matter in hand, with this view. The friends of Agassiz—the friends of education—propose to raise a memorial to him, by placing upon a strong and enduring basis the museum, which is at once a collection of natural objects, rivaling the most celebrated collections of the Old World, and a school open to all the teachers and pupils in the land. It is to be hoped that the people of America, among whom Agassiz unselfishly labored and among whom he spent the last portion of his life, will not hesitate to carry on the work he has begun. His example and his teaching have benefited every section of the country, even to our out-of-the-way California. The museum he planned and founded will, if suitably endowed, become an ever increasing source of scientific and practical usefulness to the nation and the world. We cannot doubt, therefore, that the appeal made by the committee will be answered by the public in the same generous spirit in which Agassiz devoted his genius to the furtherance of science and the advancement of education among us. Subscriptions may be sent to Sebastian B. Schlesinger, Esq., Treasurer of the Agassiz Memorial Committee, 5 Oliver street, Boston. Teachers and pupils desiring to subscribe to the "Teachers and Pupils Fund" of the "Agassiz Memorial" can address J. M. Barnard, No. 13 Exchange street, Boston.

A BLACK ROCK VEIN.—The Burnt Flat Co. have been sinking for a valuable quartz vein, on the bank of the North Fork of the American river, under the shadow of Cape Horn, on the C. P. R. R., since 1866. Two or three tunnels and as many shafts were sunk without discovering the main auriferous vein. Recently the owners concluded to test a ledge of black rock, whereby they stumbled, as it were, upon very rich pay. The company are now confident of rich rewards for their perseverance. Upon receiving samples, we shall have further to say about the ore.

TOPS OF MOUNTAINS.—Secretary Delano has decided that the applications to purchase the tops of Mount Broes and Mount Lincoln, in Colorado, as placer mining land, where quartz has been discovered on the surface, are contrary to law. Whenever minerals are found in rock in a placer, they must be applied for as lodes, for which \$5 per acre is demanded.

The tallest chimney in the world is being constructed in Lawrence, Mass. The work is resting at 100 feet in height, in order to settle and season before putting on the entire immense weight.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., April 7, 1874.

FOR WEEK ENDING MAR. 24, 1874.

CAR FOR SINGLE-TRACK RAILWAYS.—Thos. M. Rankin, Modesto, Cal.

FENDER FOR VESSELS.—John B. Treadwell, S. F., Cal.

SLIDE VALVE.—Charles O. Farciot, S. F., Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

RAILROAD WORK.—Advicee from Olympia, W. T., state that work was commenced on the Olympia and Tenino R. R. on the 7th inst. The citizens turned out en masse, closing up every place of business and devoting the day to hard work on the grade.

The Bellingham Bay Coal Company is having a new shaft sunk about a half mile northeast of the present site, where it is expected a very superior article of coal will be obtained.

BUSINESS in the Tintic district, Utah, is looking up, and indications are that the district with its many advantages will attract a fair share of attention.

A VALUABLE coal mine was lately discovered back of Carmelo bay, Monterey county.

PAIN-KILLER.

1840.

1874.

Time Tests the Merits of All Things.

THIRTY YEARS is certainly long enough time to prove the efficacy of any medicine, and that the Pain-Killer is deserving of all its propitiators claim for it, is amply proved by the unparalleled popularity it has attained. It is a sure and effective remedy. It is sold in almost every country in the world, and it needs only to be known to be prized, and its reputation as a Medicine of Great Virtue, is fully and permanently established. It is the great Family Medicine of the age. Taken internally, it cures Dysentery, Cholera, Diarrhoea, Cramp and Pain in the Stomach, Bowel Complaint, Painters' Colic, Liver Complaint, Dyspepsia, or Indigestion, Sudden Colds, Sore Throat and Coughs. Taken externally, it cures Bruises, Boils, Felons, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost Bitten Feet, etc.

Pain is supposed to be the lot of us poor mortals, as inevitable as death, and liable at any time to come upon us. Therefore, it is important that remedial agents should be at hand to be used on emergency, when we are made to feel the excruciating agony of pain, or the depressing influences of disease. Such a remedial exists in Perry Davis' "Pain-Killer," the fame of which has extended over all the earth. Amid the eternal ices of the Polar regions, or beneath the intolerable and burning sun of the tropics, its virtues are known and appreciated. And by it suffering humanity has found relief from many of its ills. The effect of the Pain-Killer upon the patient, when taken internally in cases of Cough, Cold, Bowel Complaint, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores and Sprains, Cuts, Stings of Insects, etc., and other causes of suffering, has secured for it the most prominent position among the medicines of the day. Beware of counterfeits and worthless imitations. Call for Perry Davis' Vegetable Pain-Killer, and take no other.

Sold by Druggists and Grocers.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or revised, wholesale and Retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes, by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality. Price \$2.50 cloth, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is illustrated by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator. Price, \$5 in cloth; \$6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, \$2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, \$1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counselors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address

DEWEY & CO.,

PUBLISHERS, PATENT AGENTS AND ENGRAVERS,

No. 338 Montgomery street, S. F.

COUGH-WORN VICTIMS whose lungs are racked and torn with paroxysms that threaten to choke you, all that you have to do is to take *Hale's Honey of Horehound and Tar*. A rapid cure is certain. Crittenton's, No. 7 8th Avenue. Sold by all Druggists. Pike's Toothache Drops cure in 1 minute.

THE IMPROVED CHAMPION SPRING MATTRESS

Is Light, Noiseless, Elastic and Durable.

CAN BE USED EITHER SIDE UP.

No Vermin can harbor about it. So constructed that the pressure is equally distributed. Does not sag or hag. Can be rolled up in a small compass for transportation. Manufactured by

W. H. SMITH, Manufacturer, No. 151 New Montgomery street, SAN FRANCISCO, 11v23-lam-3m

The New Wilson SEWING MACHINE

Has points of superiority over all others. A reliable warranty is given with each machine for **FIVE YEARS.** It is unequalled for light and heavy work. Examine and compare it with the highest priced machine in the market. O. A. NORTON, Gen. Agt for the Pacific Coast, 337 Kearny St., S. F.

PRICE, \$50.

WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere.

WELLS, RUSSELL & CO., Mechanics' Mills, Cor. Mission & Fremont Streets, 37-23-3m-sa

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Benjamin Mill and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Devil's Gate District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 401 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors, LEANDER LEAVITT, Secretary. Office—Room 7, No. 401 California street, San Francisco, Cal. de28

Black Mountain Coal Mining Company.—Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale. By order of the Board of Directors, F. N. WELLS, Secretary. Office—No. 402 Montgomery street, Room No. 23, San Francisco, Cal. mrl4-4w

Commercial Coal Mining Company of San Francisco.—Principal place of business, City and County of San Francisco, California. Location of works, Santa Cruz County, Cal. Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1874, an assessment of 3 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of May, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale. By order of the Board of Directors, S. B. HANSON, Secretary. Office, No. 402 Montgomery street, Room No. 23, San Francisco, California. mrl4-4w

Geneva Consolidated Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California.

Location of works, Cherry Creek Mining District, White Pine County, State of Nevada. Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth (10th) day of February, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
G. W. Robbins.....	not issued	4,750	\$1,187 50
I. T. Milliken, Trustee, not issued		2,000	500 00
I. T. Milliken, Trustee, not issued		110	27 50
I. T. Milliken, Trustee, not issued		5,100	1,275 00
I. T. Milliken, Trustee, not issued		5,000	1,250 00
I. T. Milliken, Trustee, not issued		3,145	786 25
I. T. Milliken, Trustee, not issued		2,800	700 00

And in accordance with law, and an order of the Board of Directors, made on the 10th day of February, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the company, Room 14, 302 Montgomery street, San Francisco, California, on Tuesday, the seventh (7th) day of April, 1874, at the hour of 12 o'clock p. m., of said day, to pay delinquent assessments thereon, together with costs of advertising and expenses of sale. I. T. MILLIKEN, Secretary. Office—Room 14, 302 Montgomery street, San Francisco, Cal. mrl2

POSTPONEMENT.—The above sale is hereby postponed till Saturday, the eighteenth (18th) day of April, 1874, at same hour and place above mentioned. April-28 I. T. MILLIKEN, Secretary.

CAUTION.—Germania Mining Company.

Machinery and Castings of all kinds.

OVER \$3,500 PER MONTH SAVED BY THE USE OF HENDY'S IMPROVED CONCENTRATOR

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

JOSHUA HENDY, Esq.—Dear Sir:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feather) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.
I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—Dear Sir:—In answer to your inquiries as to your concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over \$3,500 per month more than with the blankets and huddles formerly in use.

O. C. HEWITT, Supt.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOVE'S & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.

VOLUME XXVIII
Number 19.

The Stickeen River Country.

Considerable interest has been manifested for the past six months, by the mining community, with reference to the Stickeen mines. Contradictory reports come from these, from time to time; but the unfavorable ones have not deterred great numbers of miners from going to the new diggings. We have published all the reliable information attainable concerning these mines for the benefit of our readers, and are now enabled to give them, in the accompanying map, some idea of the lay of the country. Mr. Peter Cargotich, who was one of the early discoverers of these mines, and who returned thither, last fall, has written us a letter and enclosed a slight sketch of the route to the mines, from which we have compiled the map shown on this page. It is chiefly valuable as giving the distances from point to point; so that miners who intend making the trip will have an idea of the distances to be traveled from day to day.

The route from San Francisco is as follows: From here to Portland, Oregon, 733 miles by steamer; fare, \$30. From Portland to Victoria, 308 miles; from Victoria to Nanaimo, 74 miles; from Nanaimo to Fort Wrangel, 768 miles, all by steamer. The fare by the steamer from Portland to Fort Wrangel, near the mouth of the Stickeen river, is \$50 in the cabin and \$35 in the steerage. At Fort Wrangel, the Stickeen river is ascended in small boats to Buck's Bar, 162 miles. From Buck's Bar to Dease's Lake the route is overland, the dotted line on the map showing the trail. The drawing made by Mr. Cargotich gives the distances continuously from Fort Wrangel, Alaska Territory. The Hudson Bay Company's Post marks the boundaries between American and English possessions. The map may not be made on a correct scale, but the distances, as given by Mr. Cargotich, correspond with those given in the Government Survey.

The letter of Mr. Cargotich accompanying the map has been a long time on the road, as it was written in January, unless he had lost run of the months on his trip. He writes from Buck's Bar. He says he arrived there on the 20th of September, and was some days building winter quarters. While doing so several miners returned from the diggings and greatly discouraged his party as to the possibility of getting to the diggings that fall. They went, however, to see for themselves, arriving at Dease creek on the 4th of November, staked off claims and returned to Buck's Bar, making the round trip in ten days, notwithstanding the fearful cold they encountered. At the time of writing he was to leave for Dease Lake in a few days, drawing the provisions in sleds. It was impossible to employ Indians, as they wanted from \$15 to \$20 per day. The coldest weather experienced by Mr. C. during the winter at Buck's Bar was 30 degrees below zero. At the time of writing, flour was selling at 24 cents per pound; bacon, 50 cents; sugar, 50 cents; beans, 30 cents, and other things in proportion. He says he thinks flour will be worth 75 cents at the mines. As far as he prospected he thinks the mines will be very rich; at least they have great expectations. He says of 50 men wintering at Buck's Bar not a single case of sickness occurred. He says they took up a subscription to have an Indian take their furs to Fort Wrangel, which probably accounts for the lateness of its arrival here, if the Indians there are like other Indians.

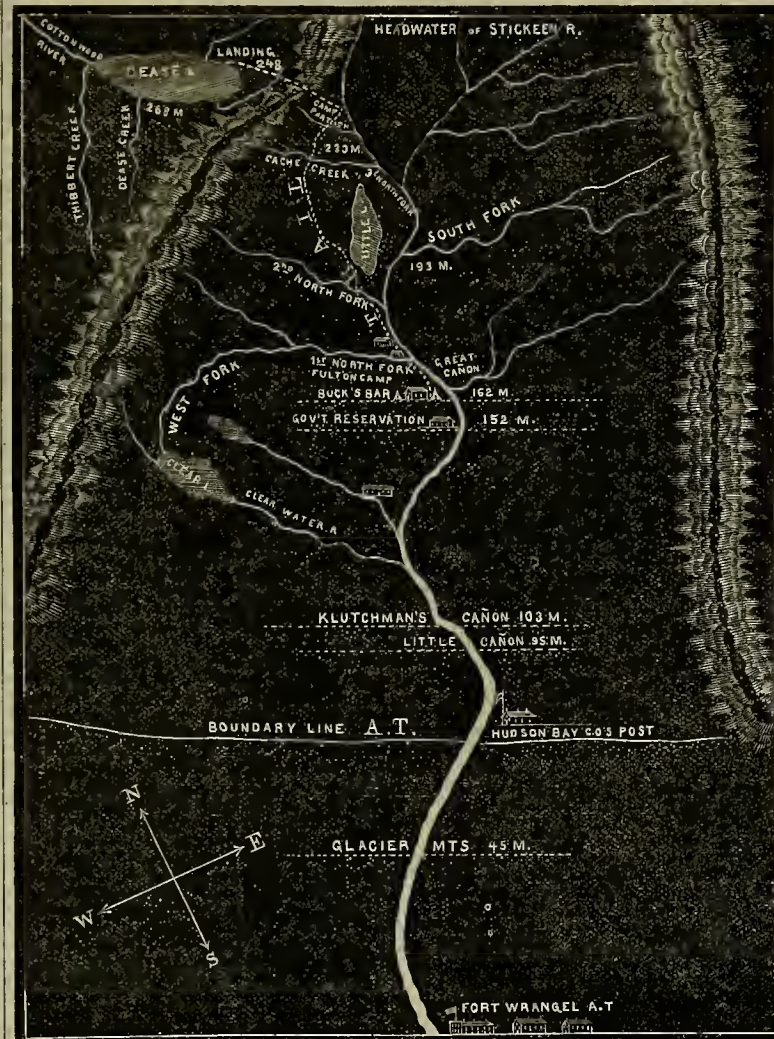

Mr. Cargotich is now at Dease creek, as an item in the *Victoria Colonist* shows. It says: Peter Cargotich writes to Mr. Grancini, under date of March 16th, from Dease creek. He says he has secured a claim that prospected from ten cents to \$1.50 to the pan, and thinks mining operations will commence about the 1st of May. Allen Grant, of Glengerry, Canada, died in Cargotich's cabin. His complaint was heart disease. He had just returned from a prospecting tour, and was telling about a rich claim he had discovered, when he fell over dead. There were some 400 men in the diggings.

The *Portland Bulletin*, of April 6th, gives the following additional information from those mines, which shows that it is yet too early to do much work there:

It will be remembered that the dispatches received from Victoria on Friday last gave an

inkling of good news from the gold regions of the North, and the arrival of the steamer California from that section of the country has been anxiously looked for. The steamer arrived yesterday morning, and Purser Vanderbilt called on us last evening and furnished us with the annexed intelligence. He says Mr. Sylvester (Barnard's Express messenger) arrived at Fort Wrangel on the evening of the 26th ultimo, direct from Dease lake and Buck's bar, having been eleven days from the former and three days and a half from the latter place, traveling the entire distance on foot,

staked off, and promise well. Rich diggings are reported on the third fork of the north branch of the Stickeen river. All work is being done by building large fires and thawing out the ground, and even with these drawbacks miners are making all the way from \$10 to \$30 per day. Allen Grant, a Canadian, well known in the mines, recently struck a rich ledge after almost superhuman exertions, and the excitement is said to have brought on the heart disease, killing him almost instantly. Fortunately, however, good luck does not often affect miners in this way; they, as a general thing, surviving

MAP OF STICKEEN RIVER AND CASSAIR MINES.

and most of the time on the ice. He was twenty-one days making the round trip from Fort Wrangel and return. He reports large quantities of provisions scattered along the route on the ice, it having been thrown away by overburdened miners, they finding they had started away with more than they could carry. There are about 40 men in the mines, while probably there are as many more encamped along the Stickeen river, awaiting the breaking up of the ice in order to get through.

It is expected the ice in the river will break up very soon, probably by May 1st, as the upper country ice was loosened in many places. Sylvester brought down a large quantity of duet, and from all reports, there was untold wealth left behind. A rich claim has just been struck immediately adjoining the one located by the Ruth brothers, and a gentleman at Fort Wrangel received a letter informing him that his interest in a claim just prospected was worth at least \$2,000. Most of the claims on Thibit's Lake (six miles in length) have been

such circumstances with amazing good grace. There appears to be no scarcity of provisions, although they are necessarily high-priced, owing to the difficulties of transportation. The opening of the river, however, will in a great measure obviate this evil, and a rush will undoubtedly be the result. About eighty miners are expected to go up on the next steamer; and as news like the above is apt to travel like wild-fire, we may expect to see very many en route for there during the ensuing month.

ANOTHER QUICKSILVER MINE.—A correspondent of the *Alta*, writing from San José, states that a San Francisco company has leased for five years, with the privilege of buying, the mineral lands known as the Pearce Place, or "North Almaden Mine." Four experienced miners, Theo. Indenethro, R. B. Harper, John M. Harper, and George A. Koch, have been sent out to prospect. They took teams, tools, gunpowder for blasting, lumber for cabins, etc. It is believed a hundred men will be at work on these mines within a few months.

Pacific Rolling Mill Improvements.

A visit to the Pacific Rolling Mills, on the Potrero, will surprise any one who has not been there for the past few months, as the improvements that have taken place have materially changed and enlarged the establishment. Their works are the largest of the kind on this side of the Rocky Mountains, and it is gratifying to note that their business has increased so much during the past year that they have been compelled to add new and enlarged machinery, buildings, etc., to meet the requirements of trade. Late improvements at the mills have caused an expenditure of about \$200,000.

We were shown through the works one day this week, by Messrs. Keency and Noble, who obligingly pointed out what had been added since our last visit, and gave us an opportunity of seeing the manner in which work was conducted. The new blacksmith shop is twice as large as any in the city, and is distinct from the other buildings. It has been arranged with a view to facilitate work as much as possible, and is light, airy and well ventilated. A new, upright 50 horse-power engine, built in this city by the Risdon Iron and Locomotive Works, has been placed in this shop. There are six furnaces for ship-spikes, rivets, etc., and one steam and two belt-hammers. Car work, locomotive and steamboat forgings, etc., are done in this shop. They are now busy on girder-work for the new Palace Hotel.

In the main building or rolling mill, a number of improvements have been made. A handsome, large new upright engine—30x32—built by the Pacific Iron Works, in this city, and of 450 horse-power, has lately been placed in position. This engine cost about \$20,000, and is a beautiful piece of machinery, working smoothly and steadily, and doing a large amount of work. This engine is used for furnishing power to the new three-high rail-mill, the puddle-mill and coffee-mill squeezers, which, with a new 12-inch mill, have recently been put in. They now have an 8-inch mill, a 12-inch mill, an 18-inch rail-mill and puddle-mill; they have five trains in all. The rail-mill will turn out 60 tons of rail per day, and the large piles of rails in the yard, for the Central Pacific Railroad, show that the mill has of late been kept pretty busy.

During the past year, 20 new boilers have been added to the establishment, making 30 in all. Six new furnaces have been put up, making 15 in all. The works are turning out large quantities of railroad iron, principally for the Central Pacific Road, and are making merchant iron of all classes. They now supply most of the merchant iron to the large business firms in this city. The works consume about 900 tons of coal per month, all of which is brought from Australia. They are running night and day, and are at present employing 250 men. The addition of the new three-high rail mill enables the works to turn out railroad iron in much larger quantities than heretofore, and at the same time with much less trouble and great saving of time.

RISING SUN MINE.—The mill on this mine, one mile from Colfax, has been running on very rich rock. Owing to extended prospecting on the ledge, dividends are likely to be suspended for a while. Some ten or more have been paid the past year. The main shaft is 360 feet deep. The longest drift has been carried 450 feet west. The ledge for 250 feet in the west drift averages some 18 to 20 inches in thickness of rich ore, but is found comparatively shut off in places. A new shaft is being sunk several hundred feet west of the present hoisting shaft to another level, which it is expected will open a good supply of ore. The machinery will be moved to it. The west drift on the 360-foot level is also being pushed ahead in expectation of realizing a favorable deposit of ore.

The works comprise 5-steps, amalgamator, 2 pans for settling and grinding sulphurets, Cornish pumping apparatus, blacksmith shop, etc. Thirty to forty hands are employed, in shifts. Jacob H. Neff is President of the company; W. A. Hines, Sec'y; S. Manuel, foreman; Wm. Crovan, Engineer.

Victoria Mines.

A work published by an English firm, entitled "Australia and New Zealand," contains the following concerning the mines of Victoria: At the close of 1851, Victoria took the foremost rank of all the colonies for mineral wealth and prospects. Notwithstanding many efforts since to develop other treasures of the earth—silver, copper, tin, and coal—gold continues to be the one main mineral product there. This colony is inferior to New South Wales in the variety of its mineral resources, although this export of gold in Victoria is more important. The yield has fallen off of late years, as will be seen by the following: In 1851 there were 145,146 ozs.; in 1852, 2,218,782 ozs.; in 1853, 2,676,345 ozs.; in 1854, 2,150,730 ozs.; in 1855, 2,751,535 ozs.; in 1856, 2,985,991 ozs.; in 1860, 2,156,660 ozs.; in 1862, 1,658,207 ozs.; in 1866, 1,443,687 ozs.; in 1870, 1,222,598 ozs.; in 1871, 1,345,477 ozs.; in 1872, 1,331,377 ozs. Victoria is now divided into seven mining districts, viz.: Ballarat, Beechworth, Sandhurst, Maryborough, Castlemaine, Ararat, and Gipps Land. Wardens, mining surveyors, and registrars are placed over subdivisions of these. One-third of the colony is pronounced to be auriferous. At the close of 1871 there were 404 steam-engines employed on alluvial mining ground, of which 219 were at Ballarat. There were 705 on quartz reefs, of which 168 were in the Sandhurst district, 143 Castlemaine, and 132 Ballarat. There were 1,465 horse puddling machines, 326 steam puddling machines, and 18,430 sluices, toms, and sluice-boxes. Not less than 6,590 stamp heads were at work on quartz and cement. The mining plant was valued at £2,060,855, and the land was estimated at £2,475,046. Silver at one time seemed very promising at St. Arnaud, near the western edge of the dividing range. After 11,348 tons of ore were raised, valued at £5,047, a pause followed. Lead is seen in various places. In 1871 there were raised 45 tons of ore valued at £870. The Murrindal mine of Gipps Land is being worked. Antimony is more promising.

The chief mines are at Heathcote, Woods Point and Castlemaine. In 1871 only £869 worth were exported, but the total value of that raised altogether has reached to £67,795. Heathcote exported 4,268 tons of ore in the first half-year of 1873. No copper was raised that year, though 7 tons, 4 cwt., valued at £928, were exported. Much expectation was excited about a mine on the Thompson river of Gipps Land. Castlemaine, St. Arnaud, Crooked river and Maldon, have yielded specimens. Bismuth is collected at Tarragower, Clunns and Omeo. Manganese is found from Clunns and the Loden. Cobalt, in paying quantities, is expected from Gipps Land and the Gonibouru. Plumbago is known at Cresswick, and zinc at St. Arnaud. Iron has never been wrought, as in New South Wales, though pretty rich ore exists; as hematite, near Melbourne; arseniate, at Malson; micaceous specular, at Lake Tyers; phosphate, at Sarsfield of Gipps Land; titaniferous, at Beechworth, Dandenong, and along the Yarra; and magnetic at the Sandhurst diggings. From sixty to seventy per cent. has been estimated to be pure iron in some of these samples. The meteoric iron block that fell near Cranbourne weighed 30 cwt. Tin has already become an important object of search. Altogether the export has been £255,891. Up to 1865, 2,380 tons were raised. The black oxides is the form assumed in the ore. At Beechworth fifty-four per cent. pure metal has been smelted. Tin is also found at Walhalla, Daylesford, Lolac, Cape Otway, Chiltern, and the Tarwin. Coal has often raised the hopes of the Victorians. The known carboniferous area is 4,000 square miles. Hardly any seam of a fair quantity has been got at.

PALISADE DISTRICT.—A good deal of excitement was occasioned a few days ago, by Jerry Cope coming up from Golconda with ore from a new strike in Credit Mobilier mine in Palisades district. This ore, being burned and crushed, assayed above all expectations. Here are the figures: One piece inferior, \$28.11 in gold, \$3.44 silver, per ton. A piece of the best showed \$641.31 in gold, \$401.34 silver. This piece of quartz was taken from the shaft, at a depth of only 14 feet from the surface. At this point the ledge is 3½ feet wide, the stratum showing gold being eight inches. The yield was astonishing; but the wonder vanishes when one closely examines the rock, for it is studded with points of pure gold cropping out through the pores of the quartz. The mine is situated 16 miles north from Golconda. We congratulate Cope and our ancient friend A. M. Sadors, on this well-deserved streak of good fortune. Immediately the news got abroad over town, horses were mounted and trains boarded, by persons in pursuit of owners in neighboring mines, who might not be aware of the big find. Several purchases of this nature were made.

MORE HYDRAULIC DIGGINGS.—A tunnel is now being run into the side of Mount Davidson, under the town, for the purpose of washing out the surface ground about the old Gould & Curry croppings. The tunnel starts in this vicinity of the old lower tunnel of the Gould & Curry company, and is already in a distance of 250 feet. To run the tunnel will cost from \$12,000 to \$15,000. The surface dirt below and about the croppings is rich in free gold, while mingled with the decomposed matter is a vast quantity of float rock, rich in both gold and silver. The free gold found in the dirt will probably pay all expenses, thus leaving as clear gain all this float ore that will be extracted.—Enterprise.

Sierra County Mines.

Below Hardscrabble, in going further south, we pass the Iowa Mine. This Iowa Company has been working hard for many years to reach bedrock in the deep channel, at an expense of \$40,000; and in order to do so a very deep shaft was sunk by water power. After reaching a great depth, the flow of water caused a cessation of operations. So a drain tunnel was started, without a survey, however, until the same had been prospected to a considerable distance, when it was found that this tunnel was running to the left and would miss this shaft 150 feet, striking about twelve above its bottom. After a connection had been made between the drain and air tunnel and the shaft a powerful steam engine was purchased and sinking was continued on this shaft until bedrock was struck at a depth of over 200 feet, and further down until this hard stratum was reached, when a tunnel was commenced toward the center of this hill, pumping the water up to the drain tunnel. In running this lower tunnel the company lost bedrock again in a distance of some 40 feet, pitching away from them very fast into the hill. After running a tunnel about 100 feet, this company commenced sinking; but on account of the immense quantity of water coming in all around them, and having necessarily lost connections of the machinery, the water had to be raised by hand power, and, in consequence, it was impossible to free the mine from water lower than 20 feet below the bottom of the tunnel. The owners of the mine, not being flush with money, disagreed amongst themselves, and, consequently, this mine, although proved by the shaft to be valuable hydraulic diggings, has ever since lain dormant.

Adjoining the Iowa mine, on the south, we go over the Washington Co.'s ground, located immediately on the beautifully situated mountain paradise, generally known as the Mt. Pleasant ranch. About \$20,000 has been here expended to no purpose. As in the cases recited above, water stopped work.

Next we pass over the Mt. Pleasant, Ladies, and Lincoln Co.'s claims, all undoubtedly containing rich hydraulic gravel, in which untold millions of gold are sleeping, only awaiting the sound of the miner's pick, assisted by Capital and Giant Powder, to resurrect the same and bring it to light, after the powerful streams of water, driven through the great Monitors and Little Giants, have washed away these gravel banks down into Big Cañon creek, flowing past those mines 1,000 feet beneath, in its rocky bed, toward the well-known Yuba river, through a tunnel, nearing 2,500 in length, which would reach the lowest point of these mines, at almost any depth, and become the outlet of at least 1,000 acres of good paying quartz gravel banks, from 50 to 300 feet deep, containing plenty of free gold from the surface or pins leaves on the same to bedrock, as some old miners used to say. Near these mines, the so-called western channel, of Slate creek basin, united with the eastern, flows hence as a great unit to Scales, described in one of our previous articles on the mineral resources of Sierra county.

Across Rock and Cañon creeks, west of the afore mentioned last three mines, we find what may be called a branch channel, on which are prominent the Aris ground, owned principally by Boyes & Brother, who have made some developments on the same, by running a cut; but, on account of having, under an old contract, rented a great part of their water franchise, until recently, to a Chinese company, they were not able to develop their mine at this place, having used the balance of the water at their mine at Fair Play.

Since writing the above, we have been credibly informed that Col. B. F. Baker, of Gardner's Point, has located all the water of Cañon and Nelson creeks, to be conveyed in a large ditch to Gardner's Point, Grass Flat, and other places where the same will be used with the water of other companies, so as to melt away the immensely productive hydraulic banks in all these localities of which we have spoken heretofore.

The next easterly channel from Slate creek basin channels, we find on the dividing ridge of Big and Little Cañon creeks, after having apparently taken a great curving sweep from Pilot Peak, and wherever operated has paid large returns, as at Deadwood, where this channel has been so far mostly drifted until recently, when hydraulic proves a perfect success. Next below, further south, this channel has been extensively worked by hydraulic process, by the American company, at Morrinstown, who own several hundred acres of the richest kind of mining lands; and, as far as worked, have yielded three-quarters of a million of dollars. This company make use of all late improvements in mining, have plenty of water, and a good discharge of their tailings.

Adjoining that company's ground we find Messrs. Perkins & Co. working their claim with perfect success, having also a good supply of water. About one mile further south we find that this channel was worked many years ago with grand results, by numerous companies at Craig's Flat, from which several million dollars have been taken out. The American company, of Morrinstown, having wisely bought up all the water ditches on that ridge, except Perkins & Co.'s, were enabled to secure all the ground at that place; which, we believe, gives them now some five or six hundred acres of rich hydraulic ground, to be worked by them and their successors in the future ages to come.

Cherry Creek.

From a correspondent at Cherry Creek the White Pine News learns that the prospects of this camp are very flattering. The Geneva Consolidated company, comprising the Geneva and Tea-cup mines, is working a large force of men and crushing ore at the Egan mill. The property of the San Joss company is under lease with favorable results, we believe, but are unable to give any figures. The condition of the roads will render it necessary for them to shut down soon for want of ore. The mines of this company are looking very well, and at the expiration of the bonds in August, will pass to the hands of those who have so zealously prospected them. Mr. Murphy, at the head of the company, will not lose a point in his endeavors to make the work a success. The Chance mine, now under bond to Frank Halliwell, or rather to the owner of "Thad Stevens," is improving at every step. The south shaft or incline in down about 100 feet in ore, that, as far as prospected, shows a pulp value of \$124. Under the able management of Mr. Halliwell this mine has become, as it were, the key to the district. Thousands of dollars have been expended in its development, and ore enough is now upon the dump and in sight to run 20 stamps for at least eight months. The Chance has been incorporated; the bond will expire May 1st, when the stock will in all probability be floated and work vigorously prosecuted. We understand that orders have been given to put on a large force of men for the purpose of thoroughly testing the mine before the bond is paid. The company has secured a mill-site, and it is asserted that a mill will soon be erected upon it.

North of this last named mine is situated the property of the Cherry Creek Consolidation. Under the able management of our old friend, E. B. Dickinson, work is being prosecuted on the mines as vigorously as the rough weather will permit, and good ore is being shown. It is a splendid prospect for a heavy and profitable mining venture. The Baltic is under bond to Geo. Treat, and work is pushed whenever the weather permits. There are several properties now under bond to responsible parties, upon which work will be commenced the present month, and a brisk summer must follow. This camp, as a whole, presents one of the best fields for prospecting in East Nevada; the veins are generally large, strong fissures, carrying excellent free ore. The town rather went ahead of itself in the little "spurt" it had last fall, but is now settling down to a legitimate business. It is asserted that if miners were called for immediately, a dozen could not be found; this augurs well, showing that all are at work who desire it. The extreme cold weather has retarded travel greatly, but we learn that it is on the increase.

Mines of New South Wales.

The mountainous part of New South Wales is one of the richest mineral regions in the world. Gold, silver, tin, copper, lead, iron and coal abound there. In 1871 the colony boasted of 250 puddling machines, twenty-two hydraulic hoses, and eighty crushing machines. In twenty years the yield of gold in New South Wales has been about forty millions. Up to the end of 1872 the Sydney mint had coined £32,354,000. The eighty gold-fields extend over an area of 14,000 square miles. The chief localities of the western mines are Solihale, Bathurst, Tambaroora, Mules, Gulgong, Greenfell, Carcoar, Trunkay, and Orange. Those of the southern are Gonibouru, Braidwood, Adelong, Tmmt, Wagga-Wagga, Araluen, Bur-rangong, Kiandra, and Gindagla. In the northern are Rocky River, Armidale, Tamworth, and Nundle. The fields of Timbora, Ironbark, Peel, and Boorook are in the north; Kiandra, Dalsegate, Shoalhaven, Jongoing, Emu Creek, and Jembaumbene are in the south; Lachlan, Turon, Ophir, Meroo, Cudegong, Tenna, Mitchell's, and Apple-Tree Flat are in the west. The copper of Orange district extends over twenty miles square, and Monaro wealth cannot be ascertained from the inaccessibility of the country. Silver lead is obtained at Wolgarlo, on the Yass river, at Moruya, at Modbury, at Scone, in the basin of the upper Murrumbidgee, and at the Isis river. Cinnabar has been raised near the Cudegong river. Iron, though often of high percentage, and found near both coal and limestone, is worked with difficulty, owing to the rate of wages and cost of carriage. This useful metal abounds near Combing, Warranbungle, Port Macquarie, Monaro, Berrima, Modbury, Shoalhaven, Murry county, Araluen, etc. Tin, during the past and present years, has been produced in New England, near the Queensland border. Of that rich tin ground, New South Wales possesses two-thirds of the area. Tenterfield and Inverell are the centers of this wonderful region; though the metal has been found near Albury, in the Tmmt river, and in several parts of the Alps. But coal is, after all, the most valuable of the natural wealth of New South Wales. Though the neighborhood of Newcastle, at the mouth of the Hunter, is the principal source of this mineral, profitable workings exist at Berrima, Maitland, Hatley, Patrick's Plains, Clarence river, and Wollongong of Illawarra. The coal area of the colony, though officially rated at 10,000,000 acres, may prove to be several times greater.—English Hand Book.

SEVERAL coal mines near DuQuoin, Illinois, have been closed, the veins being exhausted.

Our Naval Efficiency.

To any one who has labored under the conviction that our navy, though small, is nevertheless, taking into consideration the class of vessels of which it is composed, of the highest possible efficiency, the reports of the late fleet drill in Florida bay are especially discouraging.

A larger number of first-class ships than ever before has been collected under a single commander sailed around for several days; and as a result, we are informed that they, practically the cream of the navy, cannot maintain a speed of six knots per hour in company. In other words, if attacked by a squadron of fast foreign iron clads, they could not, if worsted, run away; or if falling in with swift sailing merchantmen, they could not catch them. In letters from officers of high rank, we find it stated, in brief, that our crack wooden ships are practically valueless, that they are loaded down with a mass of rigging which would hamper their efficiency in combat, and that, so far as the experience of the writer extends, the war vessels of the future should be swift steam rams, devoid of sail except such as a necessity for their safety in stormy weather.

Another fact, equally unpalatable, is that in connection with the torpedo practice. During the course of this drill, the vessels were required to attack a floating target at a speed of four miles per hour and to explode torpedoes from the ends of booms rigged out for the purpose. Some ships fired their charges at the right time and smashed pieces off the target; more did not, and only succeeded in blowing up huge columns of water.

About the only fact evidenced was the absurdity of supposing that an enemy's ship would stand still or slow down, to let a vessel stick out a long boom with a lot of rigging and a torpedo on the end, slide up at the rate of a mile in 15 minutes, poke the torpedo carefully under her water line and fire it, when a single charge of grape at short range would smash boom, rigging, torpedo and operators into fragments. Our ships were strictly limited to four knots speed, and the operations were supposed to be as closely as possible a reproduction of what would be done in action.

We spent millions, not long ago, for vessels which were to steam 16 knots per hour, and carry powerful batteries. Their hulls may now be seen slowly rotting in the navy yards, or else altered into slow cruisers. "Islerwood's costly failures" is their generic name. We are maintaining a torpedo school, sending boards of officers to Europe to report, and trying new inventions of submarine warfare, and yet the first really practical trial of the efficiency of an important branch of the system amounts to nothing, and proves nothing except that an inventor is needed who will devise a new way of adapting the torpedo as an offensive arm to vessels of war.—Sci. Am.

A MINERAL EXCHANGE IN ST. LOUIS.—The proprietors of the St. Louis Railway Register have lately opened a mineral exchange and reading room at No. 509 Walnut street, in that city. The chief attraction of this exchange is an extensive and interesting classified collection of ores, clays, coals, building stones and valuable minerals of all kinds gathered along the lines of Western railroads. Over ten thousand specimens are already in the cases, including iron, lead, zinc, coal, gypsum, fire clays, hone-stone, marble, granite, limestone, sandstone, paints, ochres, baryta, copper, rock salt, uranium tellurium, nickel, cobalt, kaolin, stearite, mica, manganese, gold, silver, and other minerals too numerous to mention. There are also on file in the reading room all the journals which those interested in mining, metallurgy, manufacture or railroads have occasion to consult. It is open to all who may choose to avail themselves of its facilities and conveniences.

A NEW textile fiber, resembling ramie, covers a large area of the State of Guatemala. Mr. Comstock brings specimens eight feet long, gathered after being overried by ripening. It is the worst weed known there. It is only used for ropes and twine. The Indians make it up. For paper stock it is evidently superior to any vegetable now in use; and, if gathered in season, it is presumed that it would make good like ramie cloth.

DISCOVERIES of copper ore of a superior quality are reported in the neighborhood of Cañon City, Colorado. Silver ore, said to be very rich, has been found just west of Cedar Park, northeast of Estes Park, in the same Territory.

MR. BAKER, an Englishman, has invested largely in smelting works in Warren county, Virginia. He realized one hundred per cent. upon his ventures in 1873.

Rich deposits of lead are being discovered in various counties of Missouri. Cass county especially is developing great wealth in lead mining.

OVER \$14,000 has already been taken out this season in the vicinity of Douglas City, Trinity county, all from three or four claims.

LARGE shipments of borax are being made from the Desert Spring's deposits, in Los Angeles county.

A SILVER mine has been discovered in Stone county, Missouri.

BIRMINGHAM makes about 1,000,000,000 steel pens annually.

SCIENTIFIC PROGRESS.

Storms, Fogs, Cyclones.

The systematic observations in regard to the state of the weather made at the present day at numerous meteorological stations in Europe and the United States, and reported by telegraph to a central station, are bearing fruit. The predictions deduced from laws founded on the experience gained are fulfilled in the great majority of cases, while the number of erroneous predictions is growing smaller and smaller, giving strong hopes that ultimately they will entirely disappear, in which case meteorological prophecies will belong to a class of predictions as reliable as are those of eclipses and other astronomical phenomena.

Storms.

To the old observations that generally wind and rain are predicted by a low barometer, which means a diminished atmospheric pressure, has been added the knowledge that there are definite areas of low barometer which travel as a wave in certain predetermined directions, so that now we can not only predict a storm from the observation of a low barometer, but we can predict where the low barometer may be expected, and in what regions the subsequent storm is to travel, and often, even the direction and force of the wind during its progress. The saving of human life and property in consequence of the timely warnings made at the signal stations of our weather bureaus in our marine and lake ports, has already been immense; and encouraged by these results, other signal stations are being erected at prominent points on our sea-coast, so as to be as much as possible within sight of vessels outside, which then can take their course according to the indications given of the weather to be expected.

Fogs.

The latest observations have also shown that even a storm is preceded by a low barometer, a fog is preceded by a high barometer; so that the late English weather reports prove that the dreadful fogs under which London suffered on the 11th, 12th and 13th of December last, were preceded by an aerial wave of high pressure; and as the condition of the atmosphere in a fog is in some respects the opposite of that during a storm, (namely, no wind or too much wind,) it is rational to suppose that they proceed from opposite previous conditions—excess or deficiency of atmospheric pressure. Considering the results of the latter closely, and knowing that the capacity of the air for moisture increases with the pressure, we find that a high barometer or dense atmosphere is favorable for causing the air to absorb much moisture, which, as soon as this pressure is relieved, becomes visible as a cloud; and if wind be totally absent, a fog—more dense in proportion to the moisture present. To this must be added that when a gentle current of cool air passes over a warm, moist layer of air below, or over a surface of water, warmer than this air, vapor will be condensed and a layer of fog formed. Considering that the capacity of air for moisture diminishes with the pressure, it is a natural consequence that a precipitation—moisture—a rain—must generally follow a low barometer.

Cyclones.

The knowledge of the nature of the so-called cyclones, or gigantic whirlwinds, which are the terror of navigators, has also become more correct in consequence of the late observations. It is found that they do not move in circles, but in ellipses, of which the longest diameter is parallel to the equator. As the center of these cyclones is the most dangerous portion, and to be avoided by navigators, this knowledge is of the utmost importance, as by means of it ship commanders will be less exposed to the danger of sailing in the elongated axis, by avoiding to sail east or west, and rather to sail north or south.

Highest Observatory.

Not content with an observatory on top of Mount Washington, more than 6,000 feet high, our weather bureau is establishing one on the top of Pike's Peak, in Colorado, more than double that height, namely, 14,216 feet. The observations on Mount Washington have shown that all great storms come from the southwest, and quickly disappear eastward over the Atlantic ocean. Great expectations are therefore indulged in about the results to be achieved by an observatory in the regions where the storms originate, large mountain masses and peaks being especially considered as storm brewers. Our Rocky Mountains form such formidable barriers to the interchange of atmospheric masses around them, and covered as they are with perpetual ice and snow, they influence the condition of the vapor-laden currents to such a degree that some consider them as the laboratories where all our weather is manufactured. In any case, the establishment of a meteorological observatory in the most central and highest part of our continent, in the real Switzerland of America, amid and above the cloud regions, is of the utmost importance, and promises the grandest results in this line of investigation.—*Manufacturer and Builder.*

SCHNEIDER found in barley straw an average of .78 per cent. of nitrogen; in rye straw an average of 1.65 per cent., smaller quantities than have usually been supposed. The cause of this he ascribes to the removal of parasites.

Scientific Notes from the French Academy.

From the reports of recent sessions of the French Academy of Sciences we glean the following interesting morsels of scientific intelligence.

France, it seems, has experienced an unusually mild winter. M. Tastes has investigated the matter and thinks that he has found a great atmospheric current crossing the country, which bears about the same relation to the atmosphere as the Gulf Stream does to the ocean. This current becomes displaced in longitude; and according as a given region is in the center or on the borders of the aerial flood, the winter is calm and mild or else visited with cold and storms.

Good results are communicated to the Academy from experiments in using acid tannate of protoxide of iron as a preservative of wood. The tissue on injection becomes thoroughly impregnated with a veritable ink, which prevents the destroying action of the weather. M. Moussier sends some curious specimens which, though seeming to be very hard graphite, capable of scratching glass and even silver, are composed of sugar—the residuum after evaporating, probably—heated, away from the air, to a white red temperature. MM. Jelly and Barbier suggest that the wires used for electric bells and similar purposes in buildings may be converted into fire detectors if they are simply coated with rubber as an insulator. The idea is that, where the wires of a circuit touch, on the heat melting the rubber covering, the exposed copper will come in contact, establishing the circuit, and so sounding the alarms. M. Spinelli has constructed a balloon and proposes to ascend higher than 24,000 feet. He believes that pure oxygen, in a compressible state and mixed with the rare atmosphere at great elevations, will enable him to breathe without difficulty. In spite of the numberless preventives suggested, the phylloxera continues its ravages in the vineyards of France. The Minister of Agriculture and Commerce has recently appointed a commission to examine plans, and has offered a prize of \$4,000 for a means of exterminating the nuisance. M. Ballard announces that he has completed a long series of experiments of the action of water on lead, and concludes that water containing sulphates and carbonates, attacks the metal very slightly, while the effect of water charged with chlorides and nitrates is very plainly marked.

VEGETABLE PHYSIOLOGY.—Professor Joseph Behn has communicated to the Academy of Sciences of Vienna some curious and interesting observations on vegetable physiology. He has found that young plants produced from seed germinating in pure oxygen gas of ordinary density speedily die, although they continue to consume oxygen to as great an extent as when they are growing in atmospheric air. The young plants thrive, however, in pure oxygen when the density of the latter is reduced so as to represent only a pressure of about six inches of mercury, or when pure oxygen of ordinary density is mixed with four-fifths of its volume of hydrogen. Professor Behn has also investigated the action of carbon upon the growth and greenness of plants, and found that an intermixture of only 2 per cent. of carbonic acid in the air in which plants are growing suffices to retard the formation of green coloring matter (chlorophyll), and that the process is almost or entirely suppressed in an atmosphere containing 20 per cent. of this gas. No germination of seeds took place in an atmosphere consisting of one-half carbonic acid.

ON THE MANUFACTURE OF ALLOYS OF IRON.—A patent has been taken in France for obtaining alloys of iron with magnesia, titanium, tungsten, silicon, etc. Scrap-iron and iron turnings and filings, or iron sponge coarsely pulverized, are mixed with minerals containing the manganese, tungsten, titanium, or silicon, also pulverized, in suitable proportions, and moistened uniformly and completely with an ammoniacal or an acid solution, after which the mass is compressed in molds. Great evolution of heat takes place, and in a few hours a hard compact mass results which is broken into fragments with a sledge. These fragments do not disintegrate at the temperature of melting iron. They are used in a peculiarly constructed high furnace, and when reduced yield excellent alloys. The ferro-manganese contains at pleasure from 20 to 75 per cent. manganese, and the same way ferro-silicon containing 22 per cent. of silicon has been obtained. Alloys of titanium and tungsten, or of all combined, are readily procurable. The temperature required is very high.—*American Chemist.*

A CURIOUS ILLUSTRATION OF CAPILLARITY.—The following experiment was described at a recent meeting of the French Academy of Sciences: Put into a flask a small quantity of carbonic disulphide (bisulphide of carbon), and let a small tight roll of filtering paper pass through a hole in the cork and dip into the liquid, which will ascend through the pores of the paper and evaporate rapidly on coming in contact with the air outside. The temperature is thus reduced to about zero of the Fahrenheit scale, and the moisture of the air is condensed and precipitated in the state of hoar-frost, forming with the disulphide a peculiar white hydrate. As the evaporation goes on, this gradually accumulates until it rises in mushroom shape to the height of an inch or so above the cork.

MECHANICAL PROGRESS.

Marvels of Mechanical Skill in Metal Working.

The *World of Wonder* records the following: In the twentieth year of Queen Elizabeth, a blacksmith, named Mark Scalliot, made a lock consisting of eleven pieces of iron, steel and brass, all of which, together with a key, weighed but one grain of gold. He also made a chain of gold, consisting of forty-three links, and having fastened to this the beforementioned lock and key, he put the chain about the neck of a flea, which drew them all with ease. All these together—lock and key, chain and flea—weighed only one grain and a half. Oswaldus Nethergerus, who was more famous than Scalliot for his minute contrivances, is said to have made 1,600 dishes of turned ivory, all perfect and complete in every part, yet so small, thin and slender, that all of them were included at once in a cup turned out of a pepper corn of the common size. Johannes Shad, of Meitehand, carried this wonderful work with him to Rome, and showed it to Pope Paul V., who saw and counted them all by the help of a pair of spectacles. They were so small as to be almost invisible to the eye.

The smallest steam engine on record was made by a Scotchman named Crawford. It is perfect in every part, and so small that it can be covered by a lady's thumb. It can be worked by steam, for which Mr. Crawford has a small apparatus prepared, but he usually works it by atmospheric pressure through a flexible tube, with rubber air receiver. Mr. Crawford is an engine manufacturer, and made the engines on the Cunard line of steamships. The pet engine was made as an amusement, and to show what could be done. It is undoubtedly the smallest working machine ever made. Mr. Crawford keeps it carefully enclosed in a glass case, and has refused several offers for it from persons who wished it as a curiosity.

Among the marvels of ingenious mechanism, the great clock of Strasburg Cathedral stands pre-eminent. It is said to have found a rival, however, in the handiwork of a German mechanic, of Cincinnati, who has made a clock which is thus described: We see in a glass case, a three-story, steeple-shaped clock, four feet wide at the first story and three feet high. The movement is placed in the first story, on four delicate columns, within which swings the pendulum. The second story consists of two tower-like pieces, on the doors of which there are two pictures that represent boyhood and early manhood. A tower crowns, as third story, the ingenious structure. A cock, as a symbol of watchfulness, stands upon the top, directly over the portal.

When the clock makes the first quarter, the door of the left piece of the second story opens, and a child issues from the background, comes forward to a little bell, gives it one blow and then disappears. At the second quarter a youth appears, strikes the bell twice, and disappears; at the third there comes a man in his prime; at the fourth we have a tottering old man, leaning on a staff, who strikes the bell four times. Each time the door closes of itself. When the hours are full, the door of the right piece of the second story opens, and death, as a skeleton, scythe in hand, appears, and marks the hour by striking a bell. But it is at the twelfth hour that we have the grand spectacle in the representation of the day of judgment. Then, when Death has struck three blows on the little bell, the cock on the top of the tower suddenly flaps his wings, and crows in a shrill tone; and, after Death has marked the twelfth hour with his hammer, he crows again twice. Immediately three angels, who stand as guardians in a central position, raise their trumpets with their right hands (in the left they hold swords), and blow a blast toward each of the four quarters of the earth.

At the last blast the door of the tower opens, and the resurrected children of earth appear, while the destroying angel sinks out of sight. Then, suddenly, Christ descends, surrounded by angels. On his left there is an angel who holds the scales of justice; on his right another carries the alpha and omega—the beginning and the end. Christ waves his hand, and instantly the good among the resurrected are separated from the wicked, the former going to the right, the latter to the left. The archangel Michael salutes the good, while on the other side stands the devil, radiant with fiendish delight—he can hardly wait for the final sentence of those who fall to him, but, in obedience to the command of the central figure, he withdraws. The figure of Christ raises its hand with a threatening mien, and the accursed sink down to the realms of the satanic majesty. Then Christ blesses the chosen few, who draw near him. Finally we hear a cheerful chime of bells, during which Christ rises, surrounded by his angels, until he disappears and the portal closes.

IMPROVED MACHINE FOR SCOUTING OR SCRAPING HOGS AND SEALING FISH.—This invention relates to a new machine for dressing hogs after the same have been slaughtered, and more particularly for removing the bristles from their skins, and it may also be used for removing scales from fishes. The invention consists in the use of a rotary endless chain containing a series of projecting or scaling tools or plates, and also in the combination of a cleaning brush, by which the plates are kept in condition.

WIRE ROPE.—The uses of wire rope, at first almost entirely confined in its practical application to the standing rigging of ships, are now almost innumerable. Among the most prominent of these uses, in addition to the standing and running rigging of ships, may be mentioned submarine cables for telegraphing; suspension bridges; guide, incline and flat ropes, for mining purposes; special forms of rope, for engineering uses; pneumatic telegraphs; traction ropes for tramways; steel plow ropes; ropes for the transport of sugar canes; tent stay ropes; endless driving lands; bullock traces; telegraphic running and stay strand; fencing strand; ropes for stabling; railway single cords; clock lines; clothes lines; sash lines; lightning conductors; gilt and silver cords for hanging pictures, etc. Many other applications might also be enumerated; while for all these purposes they are believed to be stronger, lighter, cheaper and more durable than any other article thus employed. These ropes are manufactured from cast, homogenous and Bessemer steel; also from charcoal and common brands of iron, bright or annealed, and from copper and brass.—*Iron Age.*

It sometimes happens that by centering, etc., the interior diameter of a tire becomes so much too large that it will not fit the wheel. Such defects have been corrected for a long time by J. Fiedler, a German machinist, by heating the tire red hot, and holding in that condition half immersed in cold water until cold, then heating again red hot and immersing the other half in the same way. In the first operation the unimmersed hot portion must contract with the portion rapidly cooled, with a corresponding condensation of material, and consequent permanent diminution of diameter, and in the second operation a similar effect is produced on the other half. By these two operations an interior diameter of 34 inches can be reduced $\frac{1}{4}$ inch, and by four operations $\frac{1}{2}$ inch. The method given is not confined to tires, an instance being given where a ring of Bessemer steel, to be used as a flange ring, had been entirely misshaped by an inexperienced workman, and was drawn into shape by heating 15 times, and cooling different portions.

COMPRESSING CAST METALS.—Mr. Horace W. Mann, of Omaha, Nebraska, has invented a portable apparatus for solidifying cast metals in their liquid state by compressed air, which is forced directly on top of the gate in the flask after the metal is poured. This invention consists of a portable reservoir for compressed air, with a pump attached, which latter is connected by rubber hose with a cylindrical cap that is fitted and clamped to a cylinder fastened to the top of flask. Both cylinders are coupled together by projecting flanges and clamps. The flask cylinder is provided with a clay wash, and, previous to the pouring of the liquid metal, with a ring or cap piece, set on top to prevent the hot metal from coming in contact with the clay wash. The ring is removed as soon as the metal is poured, the cap is then clamped on the cylinder and a stop cock opened, so that the compressed air is let directly on top of metal through the gate of the flask, compressing the metals in the molds.

WHILE America leads the world in the boldness of her suspension and arched bridges, it is, strange to say, in conservative Holland that we must look for the largest span of girder-bridge yet constructed, namely, the Meerdyck bridge, of 493 feet span, while the largest English span, the Britannia, is 460 feet, and the largest American, that at Cincinnati, is 420 feet. Even in swing bridges there appears to be nothing in this country that equals the span of the bridge at Brest, in France, of 388 feet opening, or 191½ feet from the center of turn table to the outer end. It is not unlikely that in a few years these several comparisons will all be reversed in favor of America, for in no other country at present are greater engineering structures of this description in progress or projected.—*Ex.*

AN IMPROVEMENT IN INSIDE WINDOW BLINDS was suggested to us the other day by one of our subscribers. He proposes to place the slats in a vertical rather than in a horizontal position. The effect in large halls, churches, etc., is to effectually screen the eyes from the direct glare of the external light, at the same time that the light may be freely admitted to the room. If the slats are made sufficiently wide and adjusted to stand at right angles with the sash, the room may be well lighted without any disagreeable effect either to the speaker or the audience. The gentleman referred to states that this experiment has been tried in the church at which he is an attendant, and that the result is entirely satisfactory. We regard the suggestion as a good one.—*Artisan.*

THE national inventive faculty has taken a queer twist in the direction of cigar boxes. The patent office is said to be overrun with models. We are at a loss to guess whether this is the effect of a freak like that which flooded the land with straw-cutters and washing machines, or a suggestion of the oxide on cigars which makes a new box necessary for every hundred sold, as an addition—wholly unnecessary, and unproductive of any revenue to the government—of eight per cent. to the cost of them. If it is the latter, probably a repeal of the onerous and needless exaction of a new box for every new stamp would relieve the disorder.—*Iron World.*

ALUMINUM is now being used quite extensively for gas burners.

Weekly Variations in Stocks.

(Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.) For 6 days ending Wednesday, Apr. 15, 1874.

Mr. P. Murphy, next week. He has 100 tons of high grade ore from his mine "Venus."

Courier, April 11: We learn that operations have re-commenced at the Long Tom.

SOUTHERN MINES.—Havilah Union, March 28: Kern county can represent some 20 different localities in which rich, extensive quartz mines have been discovered, during the past few months, and the miners are only waiting for the melting of the snow before they commence "the rush" to the new mines. Considerable prospecting is now being done on the mountain below the present snow-line. A \$300 prospect from one of the newly-discovered districts was shown to us yesterday, with the remark that there are "many more ledges that produce thousands of tons like it." Everything considered, the Southern mines are bound to be the field of attraction this year.

NAPA COUNTY.

ITEMS.—*Register*, April 10: Germain & Co. have discovered a very rich ledge on Chamelion Hill, near Unionville. E. D. Kelly has stopped work for the present on the Peru on account of water.

Jurian Lott and Peter Sprey are working the Lone Star, on the Black Hawk ledge, Indian District.

Lewis & James Dunn are pushing their work in the Eureka mine, Black Hawk ledge.

NEVADA COUNTY.

IRON AND COPPER.—*Union*, April 9: A large iron find has been made in this county, ten miles southwest from Grass Valley, on Newell Reed's ranch. The lode is from 20 to 100 ft. thick and the ore is very rich in metal. The ore is to be assayed and thoroughly tested to ascertain if it can be smelted. If the test is satisfactory a company will be formed at once to open the mine, and smelting works will be erected and operated. This iron is in a very accessible spot.

PLACER COUNTY.

QUARTZ MINES.—*Herald*, April 11: At the Crater mine, notwithstanding the very sad accident which happened there in the early part of the week, work is progressing finely. At the Bellevue a large force is employed daily hoisting, with their new machinery, rock, which in richness is thought will yield as well as that taken from the Crater. The Orleans is not so fully developed yet as either of the above named mines, but so far as they have gone, it rather eclipses any mine yet opened in this part of the country.

HYDRAULIC MINING is now being prosecuted with the greatest energy in the large gravel mines in the upper part of the county. They have abundance of water, and are working on the principle of making hay while the sun shines.

PLUMAS COUNTY.

EUREKA MILLS.—*Nevada Transcript*, April 11: Mr. Bigelow arrived last evening from Eureka mills, Plumas county. He reports that the mine at Eureka mills is being actively worked; 140 men are employed in the mill and mine. The mill has 40 stamps, which are being run night and day. From 80 to 100 tons of ore are being crushed daily. The snow at the mine is nine feet deep at present, and it has been fourteen feet on a level. Mr. Bigelow had to come five miles on snow-shoes before he could take the stage. During the heavy storm in February and March, there were no mail communications with Eureka mills for three weeks. Mr. Bigelow made the trip to Truckee in two days. The time between Randolph and Truckee was 14 hours; distance 26 miles.

SAN LUIS OBISPO COUNTY.

QUICKSILVER MINES AT CAMBRIA.—*Cor. San Luis Obispo Tribune*: The first mine of any note is the Keystone, owned by Cross & Co., of San Francisco. This mine has been worked for over two years, and they have taken out a very large amount of good ore. Probably 6,000 tons are now on the dumps, with a large deposit in the mine in sight, which they are now breaking out. There is no telling the value of this mine now; it cost their present owners \$22,000, and they made a good investment when they bought it. The company have got in their tunnel about 700 ft. They intend putting up smelting-works immediately, and when erected they will conduce largely to the speedy development of the mine.

The next mine I visited was the Quien Sabe—rather a curious name for a good mine, which this undoubtedly is. There has been a good deal of work done in this mine, about 500 ft. of tunnels having been run. They have found good ore throughout, and they have got out about 10 or 15 tons of ore that will assay from 5 to 20 per cent., with a large bed of very rich rock in sight.

The Pine Mountain mine has also a good prospect. It has lately been incorporated and will speak for itself in a very short time. The owners are men of means and are about to erect a furnace, which will be completed by next fall.

The Gibson & Phillips mine, on the same ledge as the Pine Mountain, was the next place I visited. Here they have run about 300 ft. of drifts in the ledge, and all the ore they have taken out will pay well to furnace. This mine is for sale for \$70,000, a good investment, better than sheep farming.

I have also to report a rich strike on the Santa Rosa Creek, but am not yet in possession of the particulars. I will doubtless be able to furnish you with some information in regard to it in my next.

SIERRA COUNTY.

FOREST CITY.—*Messenger*, April 11: The

Bald Mountain is still taking out the usual large amounts of gold.

OVER NORTH.—The water is slow in coming for the miners, at latest accounts.

LITTLE GRIZZLY.—Messrs. McFarlane and McIntyre report that the mines over there will yield well this year. Snow at this point is fourteen feet deep and hard packed.

DITCH.—Shafer & Garibaldi are bringing in a small ditch to work mining ground above the Catholic Church.

CLEAN UP.—McChessney, Evans & Boyce, of Seales, recently took out \$1,800. They have just completed a new derrick.

SOLANO COUNTY.

ST. JOHN'S MINE.—*Chronicle*, April 11: The work at St. John's mine is being pushed forward satisfactorily. New tunnels and drifts are being run, making most favorable developments of the extent and richness of the mine. There are now seventy men employed, a greater number than over before. The work of building an additional furnace at the mine was commenced this week, which when completed will double the smelting capacity. The St. John's is now turning out 200 fassks regularly each month.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—*Record*, April 5: No. 3 incline is now down 1,223 feet. The country rock is quartzite and seems to indicate the close proximity of the vein. In No. 5 the incline is 1,000 feet in depth; little is going on but the prosecution of this shaft, which is the main working opening of the Meadow Valley; is intended to supercede all others. The dumps are full, but the roads being so terribly bad, has prevented the shipment of ore. The mill, on the other hand, keeps steadily at work. When ore is not obtainable the blank is filled by tailings, and in either case a profitable result is had.

PORTLAND.—The present workings show much good ore in sight, but no more has been taken out than was necessary to pass through the several strata of ore-carrying veins. This course has demonstrated the extent and value of the lead, and now shows beyond a peradventure that the time of dividend paying is not far off.

WASHINGTON AND CAROLE.—Since our last report this mine has not disappointed our expectations, and has produced some of the richest ore that has been seen in our camp. This ore is not limited, but is very extensive and promises a rich return. Already some two hundred tons of first-class ore has been taken out and is being sent to mill, but there is plenty more of the same kind that awaits the efforts of the miner.

RAYMOND & ELY.—During the past week little has been done in this mine, save to reduce expenses and outlay in every direction.

PROCHE.—The main shaft of this mine has attained a depth of 701 feet. In the old works some ore is being taken out on shares, with profit both to the company and those engaged in the work.

BOWERY.—The drift on the 250-foot level is in 140 feet southwest. So far no particular developments have been obtained.

PAGE AND PANACA.—Little change from last week.

CHIEF OF THE HILL.—Prospecting is being continued with considerable activity, and it is thought ere long will be rewarded by some very substantial returns.

PACIFIC TUNNEL.—We learn from Mr. Nichols that operations in this undertaking are shortly to be resumed.

SILVER PEAK AND OONDOO.—In these mines but little new matter has transpired during the week. In the former, it is said a large body of rich ore has been found, but on inquiry the superintendent does not seem to be communicative.

WASHOE DISTRICT.

OPHIA.—*Enterprise*, April 11: The principal working force of the mine is still engaged in raising and sinking winzes to connect the 1,700 and the 1,300-ft. levels for securing a better circulation of air. In the drift now being run through the California ground, to connect with the Consolidated Virginia mine, good headway is being made. The connection between the mines will be made in about two weeks, when perfect circulation will be secured on the 1,300-ft. level, and the ventilation in the levels below will be very materially improved. The drifts north on the 1,300 and 1,700-ft. levels are making good progress and are meeting with favorable indications.

SIERRA NEVADA.—The new shaft was yesterday down 334 ft. The rock in the bottom continues to blast freely. The blasting out of a site for the foundation of the new hoisting-works will be completed in about six days. The sluice tunnel that is being run to tap the gravel deposit, which is to be worked by means of the bydraulic, has encountered a species of conglomerate rock which is very hard, therefore is at present advancing slowly. The mill is running day and night, and the ore-producing sections are looking and yielding about as heretofore.

BALTIMORE CONSOLIDATED.—Another heavy body of water has been struck in the bottom of the main shaft, causing a suspension of the work of sinking. At the distance of about every 25 ft. they have of late had a fresh rush of water. It will probably be a week or more before the present body of water is pumped out, as it seems to come in with considerable force. The foundation for the new hoisting engine will be completed in about 15 days. This engine is first-class in size, the cylinder

being 20 inches in diameter and the stroke 36 inches.

OVERMAN.—Good headway is being made at sinking the winz on the 1,000-ft. level, though a considerable amount of water is still encountered, which must be hoisted up the incline in a tank. Yesterday some water made its appearance in the end of the south drift from this winze. This south drift is in a distance of about 100 ft. On the 900-ft. level the main west drift is being driven ahead at the rate of about 30 ft. per week.

HALE & NORCROSS.—In the south and cross-cut there are now some quartz encountered, and in the south drift it has also increased in quantity. The north cross-cut likewise shows some quartz as it progresses. They are now putting in the pump tanks below the 1,900-ft. level, in the incline, and will resume sinking within two or three days from this date.

CHOLLAR POTOL.—Extracting 100 tons of ore per day. The average assay of car samples is \$32 per ton. The ore-producing sections present quite a promising appearance, both as regards quantity and quality.

CONSOLIDATED VIRGINIA.—The drift south from the shaft on the 1,400-ft level is now 140 ft. in length. The drift running north from the winz on this level, to connect with the first mentioned drift, is advanced 45 ft. through ore of a very fine grade. Very rapid progress is made with both of these drifts. The drift running east across the ore body at this depth is making slow headway on account of the great heat.

SAVAGE.—The connection on the 1,900 with the Hale & Norcross mine has been completed and the ventilation is now perfect. Although the quartz encountered thus far is barren, it is considered that the fact of its being present in a strong body is favorable to the finding of ore in drifting upon it.

SILVER HILL.—There having been some delay in replacing the machinery broken a few days since, little at present can be done in this mine. Being obliged to use their hoisting works in order to keep the water down in the shaft, they are unable to raise ore. A new spur-wheel for the works, weighing 8,000 pounds, was cast at Fulton Foundry day before yesterday.

UTAH.—On the 400-ft. level the south drift from the main west drift is making fair headway. The face of the drift shows an improvement. No work can be done in the ore body on the 280-ft. level until the raise is connected with that level.

EUROPA.—The winze which is being sunk at the end of the tunnel, on the west side of the lead, is now down 48 feet in rock that is working well. They have a large vein and their prospects for finding paying ore are good, very fair assays having been obtained above in the tunnel.

CALIFORNIA.—The drifts advancing into this mine from the northern and southern boundaries on the 1,300-ft. level are making very regular progress.

BUCKEYE.—In a drift on the 450-ft. level some favorable looking quartz has been met with, and it is hoped that paying ore may be encountered ere long.

CROWN POINT.—The north winze on the 1,400-ft. level has attained a vertical depth of over 70 ft. and still continues in good ore. The middle winze has encountered the west wall and is now being driven along down it toward the 1,500-ft. level, passing through ore which improves as sinking progresses. On the 1,500-ft. level they are still drifting south along the west wall. The various ore producing sections are looking exceedingly well. There is a great amount of excellent ore in sight in all the breasts on the 1,000, 1,200, 1,300 and 1,400-ft. levels. The daily yield of ore from the mine is 550 tons.

CALIFORNIA.—The new station at the 700-ft. level is nearly completed as is also the tank at this point. Between the 600 and 700-ft. levels the shaft consists of but two compartments, but the work of opening out a third has now been commenced. The new compartment is being raised from the bottom. The drain tunnel takes 225 ft. of lift off the pump and saves to the company about a cord of wood per day.

KNICKERBOCKER.—The pump will be in and ready to start to-day. The rock encountered in the bottom of the shaft remains about the same as last week.

ANNES.—Main west drift now in 163 feet and is still in ledge matter with no material change.

IMPERIAL EMPIRE.—The main east drift on the 1,900-ft. level is now in rock the stratification of which shows a near approach to the ledge.

WOODVILLE.—The work of sinking the incline in the old works has been resumed. Sinking is also resumed in the new shaft, while drifting is still going on in the north drift on the 300-ft. level.

LEO.—The streak of rich ore in the face of the tunnel does not continue as rich as when first encountered, but as it still holds out, other rich deposits are liable to be met with as the work progresses.

BULLION.—The drift which is being run from the 1,700-ft. level of the Imperial to tap this claim, is still in Alpha ground, where a promising formation is being passed through.

JUSTICE.—The only work being done is at sinking the incline.

JULIA.—There is some improvement in the ore met with in the south drift on the 1,000-ft. level.

YELLOW JACKET.—The main shaft will soon be down to the 1,640-ft. level.

SENATOR.—The long looked for reel has at

last arrived and is being put in position. They expect to resume sinking early next week.

KENTUCK.—The drift on the 1,500-ft. level is in a distance of 100 ft.

UNION CONSOLIDATED.—The drift on the 1,300-ft. level is making good progress, and in going north there is observable a very marked improvement in the formation.

KOSBETH.—This company are now drifting north toward the Dayton mine, and are encountering ore which shows a decidedly improved appearance.

NEW YORK CONSOLIDATED.—The new machinery will be started up next week, when sinking will be resumed in the shaft.

AMERICAN FLAT.—Work has not yet been resumed in this mine.

MINT.—It is expected that the new machinery will be in shape for starting up next Monday.

MONTEZUMA.—This company are still drifting along their vein and are finding some promising streaks of ore in places as they advance.

ALPHA.—The indications are more favorable at present for finding a body of ore than they have been in some weeks.

SEORAGETAN ROCK ISLAND.—Still drifting along the lead in the direction of the American Flat, in which direction they expect to find ore.

ROCK ISLAND.—The new shaft is down 48 ft. and preparations for the erection of hoisting works are being made.

ALHAMBRA.—The work of putting up the new hoisting works is being pushed with dispatch.

TYLER.—The sinking of the main shaft is progressing 16 ft. per week.

BELCHER.—The daily yield about 500 tons of fine ore. The ore-breasts throughout the stopes on the various levels continue to look splendidly, and are yielding each its allotted quantity of excellent ore. The incline has reached a depth of 156 feet below the 1,400-foot level. The rock at the bottom still remains very hard, and requires constant blasting. Everything in and about the mine is in perfect running order, and all the machinery is giving good satisfaction.

GOULN & CURRY.—The water continues to flow in great volume from the east drift on the 1,500-ft. level, and there is no change in the material passed through since the last weekly examination of the mine. There is no very important improvement to report from any portion of the mine for the current week.

DAXTON.—Began during the past week to mine ore on the third station, south of the main west drift. This is the first work that has been done in that section of the mine. The stopes are looking well. Between the second and third levels (north) they are now getting some rich ore, which considerably raises the general average. They are at present running Briggs' and the Woodworth mill. They have been running the Devil's Gate mill, but it is now shut down on account of the breaking of a cam shaft.

Colorado.

Register, April 8: The *Miner* reports that the Stevens, at West Argentine, is in good pay. Work will soon be resumed on the Comstock lode, Downieville District. The Whale mill is running to its full capacity. The Whale mine, Spanish Bar District, is being worked by a small force. The Boston & Colorado Smelting Company's new crushing and sampling works here, have been leased by Mr. Church, and are now in operation. The Fairmount, in Hukill gulch, is being worked by lessees, and we learn good pay is being obtained. The Stewart Silver Reducing Company have a large amount of ore on hand, and the amount daily taken to the mill is in excess of its capacity. The Hukill lode, Spanish Bar District, is being actively worked. Last year it produced some 2,000 tons of ore.

Oregon.

FAILING.—*Sentinel*, April 4: Miners are beginning to feel the failing of the water in the creeks and ditches, and many of them will soon be compelled to lay down the shovel for another season.

The Baker City *Democrat* learns that a large body of ore has been struck in the south level of the Summit mine, owned by Messrs. Packwood & Stewart, which mills \$30 per ton.

A GOLD-NEARING quartz ledge has lately been discovered in Jackson county, near Jewett's ledge, on Rogue river, by W. A. Johnson. This mine is undoubtedly rich in the precious metal.

Utah.

ALTA CITY.—*Cor. Tribune*, April 11: Most of the mines have paid off their men for March. The Savage is working a small force. It is the only one of the Windsor Group that is being worked at present.

THE REEN & BENSON.—Is working about 40 men, and has been shipping ore all winter.

THE M'KAY.—Is still working in a large body of ore, and is making daily shipments. The mine looks well.

THE TOLENO.—Is still looking well. It is the intention of its owners to put on a large force in a short time.

THE OLIVE.—Has been worked all the past winter, and has an incline down 112 ft., with a good foot wall and encouraging prospects.

THE FLAG STAFF NO. 2.—Is located on Peruvian hill, about one mile from Alta. It is developed by a level of 50 ft. and an incline of 60 ft. from the end of the level. The ore is soft, with large pieces of nearly pure galena—the same character of ore is found in the upper works.

THE HEUMANN TUNNEL.—Was started up again, a few days ago.

Gold at the Vienna Exposition.

In the review of the exhibits of metals at the Vienna Exposition, *Engineering* says: Before passing on to review the gold exhibits, we may say a few words respecting the relative value of that metal and silver. When, since the gold discoveries in California, about 1848, and in Australia in 1852, the quantity of that metal, which was annually produced, began to increase enormously, it was feared that the price of gold, as compared with that of silver, must fall. This, however, has not been the case in any remarkable degree. While in 1848 the value of one pound of gold was equal to 15.81 lbs. of silver, it certainly declined in 1853 to 15.20 lbs., but since then it has kept up steadily to over 15.40 lbs., and it is now over 15.50 lbs. of fine silver. In former times the difference was very much greater. In the year 1500 the value of gold was equivalent to 10.50, in 1600 to 11.60, in 1650 to 11.13, in 1700 to 14.90, in 1750 to 14.93, and in 1800 to 15.42 lbs. of silver, thus showing a constant increase, while the value of silver was successively reduced. In beginning our review with

Great Britain,

We could of course look for gold only amongst the exhibits of our colonies. In the Indian Department we noticed examples of alluvial gold from Maunbhoom and Chabassa, in Bengal, from Upper Assam, and aniferous quartz from Malabar; while from the Cape Colony there were similar samples produced by N. Adler, of Port Elizabeth, and Sir John Swinburne, of Capetown, Newcastle-on-Tyne, who also exhibited gold quartz and gold in bars. In Cape Colony the newly discovered gold fields of the Transvaal Republic and of Natal, contain lodes of rich gold quartz, which yield 70 ozs. to the ton. From our Australian colonies, we found in the department of Queensland a large nugget of gold, weighing 104 ozs., which still showed the traces of the lucky digger's pick. The value of the Queensland gold fields is, of course, variable, as in the districts of Etheridge, the gold quartz yields on an average 0.0076, in Gilbert 0.0073, in Gympie 0.00816, in Ravenswood 0.00917, and in Cherton Towers and Broughton district 0.0178 per cent. of gold. In Victoria the average yield of 900,000 tons of quartz was 0.0037 per cent. In that colony the diggings in the alluvium give way more and more to quartz mining. The biggest lumps or nuggets, which were instructively represented by models, exhibited by the Government Mining Department of Melbourne, were found in the former. Thus, the "Welcome," found in 1858, at Bakery Hill, Ballarat, 180 ft. below surface, weighs 2,195 ozs., and the "Viscount Canterbury," raised 1870, at Join's Paddock, Berlin diggings, 15 ft. from surface, is 1,105 ozs. in weight. There were in the first half of 1873, in Victoria, 35,806 alluvial miners, who won 123,643 ozs., and 17,079 quartz miners, who produced 159,605 ozs. of gold, over 14,000 men being Chinese. The quartz lodes or reefs are regularly worked with shafts and pumping and drawing machinery; the deepest mine, worked by a Stawell company, is called the "Magdalen," and has reached a depth of 1,225 ft. from surface. The Victorian exhibits comprised also some samples of gold quartz from the Ajax Gold Company of Castlemaine, and the Golden Fleece and the Hueter Reef Company of Sandhurst.

New Zealand

Made, at Vienna, a good show of her gold production, of which the total yield, up to 1873, amounted to 6,718,248 ozs., worth £25,814,260. About 734,269 ozs. of this quantity were obtained by lode mining in igneous rocks of the tertiary period, on the North Island, while by far the greater mass came from alluvial deposits, connected with metaphoric rocks on the South Island. The principal alluvial gold deposits are in the provinces of Otago, Nelson, and the county of Westland. The gold always contains silver, sometimes one-third, and the metals are separated by dissolving the gold in a solution of chlorine, when chloride of silver is left in the residue, and metallic silver is obtained through reduction with iron, by the use of a galvanic battery and acidulated water. The gold, which is precipitated from the solution and melted into bars weighing as much as 375 ozs., is 99.42 per cent. fine. The quartz reefs or lodes are principally worked in the Inangahua and Lyall districts, province of Nelson, and 85 tons of quartz of the Alpine reef yielded 860 ozs. of fine gold. A bar of unrefined gold from Hokitika contained only 0.037 per cent. of silver and 0.001 of copper, while another from the Thames district, Auckland, was composed of 65.05 gold, 33.90 silver, 0.45 copper.

France

Also showed some gold from her colonies, there being some fine nuggets from Guyana, where the annual produce comes up to about £80,000 per annum, and some from New Caledonia. Spain exhibited gold quartz from Jadenia mines, province of Toledo, containing 13 ozs. to 54 ozs. per ton, and Italy was represented by Ludovico Rocco, who exhibited auriferous ores from the mines Piandello and Alpetto, at Domo-d'Ossola, near Novara.

In Germany,

We found a few gold exhibits from the smelting works of Goslar, which produce 800 lbs. per annum, as well as from Clausthal and Freiberg, which have annual productions of 200 lbs. and 400 lbs. respectively.

The yield of gold in the Austro-Hungarian Empire was in 1871, 2,802 lbs., the greater part of which came from the Royal Hungarian Smelting Works. There are, however, some very old, even ante-Roman gold mines upon quartz lodes in Gneiss in the Duchy of Salzburg; but their yield has very much declined in our times, the Goldberg of Raurie having produced only 14.1 lb. of gold in 1871, and the Kathausberg at Gastein still less. The gold is extracted from the crushed quartz by amalgamation in Hungarian quick mills. From the gold mine of Dollach gold quartz, maps, and samples of galena were exhibited by Baron May de Madys, gold and silver ores by John Rohrer, of Lind, near Sachsenburg in Carinthia, and ores, amalgamated gold, fine gold, and fine silver by the Gastein-Rathausberg company of Oberdorf in Salzburg. The government mines of Transylvania at Verespatak, Offenhanys, Valathna, and Nagybanja are the chief producers of this metal, the mining directors of the last place showing a good collection of gold from Felsőbanja and Abudhanya, and of gold-tellurium from Nagay and Offenhanys. The gold is generally extracted in iron quick mills by amalgamation, only a part being won from regulus, as in the Upper Hungarian works.

Russia,

Though she got in 1871, 78,621 lbs. of gold from her diggings and gold mines in the Ural mountains and Siberia, was only represented by the Jakaterburg mining district, in the Perm government, there being shown samples of gold, gold sand, and drawings and models of the gold-washing machinery, as employed in that district. Russia had in 1870, 1,126 gold diggings and mines, which gave employment to 68,000 workmen. They are mostly situated in Eastern Siberia, in the districts of Slatoust and Nertschinsk, and near Jakaterburg and Nischnei Tagilek, in the Ural, while the gold mines are in the Altai, near Nertschinsk and at Beresow. The gold sand is first riddled with water and then swept over an inclined plane or huddle where the heavy material settles down. This is then re-washed with mercury and the gold freed from the amalgam by distillation. The Siberian wash gold contains 10 per cent. of silver.

Turning lastly to

America,

We found some exhibits of gold quartz by Mohrherdt and Robinson, of Bethany, in Pennsylvania, and in the interesting mineral collection of Professor Guido Kistel, of Utah, were specimens of gold and tellurium-gold from Jefferson Cañon, in Nevada. British Columbia, which in fifteen years, in the gold district of Fraser river and others, has produced gold worth at least 45,000,000 dollars, did not show anything, neither did California. From Venezuela, however, we found rich gold quartz from the mines Upata and Caratal, in Guyana, which produced in 1867, 17,118 ozs.; in 1868, 17,053 ozs.; in 1869, 22,575 ozs.; and in 1870, 35,713 ozs. of gold. Finally Brazil was represented by Dr. Continho, of Rio, with palladium gold from Gongo Soco, in Minas Geraes, and wash gold, in the shape of scales, wire, and little discs, and by the Imperial Museum and Dr. da Silva with gold nuggets, gold dust, and diamonds in their native rock, the itacolumite, which much resembles a brownish, fine-grained kind of mica schist.

DEL NORTE MINES.—The *Crecent City Courier* says: From a long acquaintance with this mining section, which lies about twelve miles northeasterly from town, we have for a number of years been satisfied that an immense ledge of gold-bearing quartz existed somewhere in that hill. My the creek, from a point about three miles above the mouth, has been worked by different parties almost continuously since 1854, and many thousands of dollars have been taken out. From above this point, up the creek, no gold of any consequence has ever been found. We are told that J. J. Connor has at last struck and located this ledge, and we were shown by James Donovan, this week, specimens of rock taken from it, coming immediately from the surface, that shows fine coarse gold in abundance, and is as good-looking rock as the ordinary run of quartz. Mr. Donovan showed us a prospect of about twenty-five cents that he had got out of a piece of the rock not much larger than a hen's egg.

MINING DISCOVERIES IN ARKANSAS.—A dispatch from Little Rock says: A special from Fulton says that Captain Holloway arrived here to-day from the newly-discovered gold mines, near the north fork of the Ouachita, en route to St. Louis, to purchase machinery to commence active operations. The mines are situated in the mountains near the Choctaw line, and are richer than at first supposed. The captain passed through Silver District on his way here, and reports the wildest excitement over the recent discoveries. After an examination of the ore and mines, he pronounces the former very rich and the latter inexhaustible. The Joplin Mining Company will at once commence the erection of several smelters for working antimony, which is found in the most extensive lodes ever discovered in the world. Miners and adventurers are flocking to the scene.

TROTTER & SMILEY, Trinity county, took out \$1,300 last week, after a seven days' run. This makes about \$5,000 taken out of this claim the present season, and much of the time they have been without water, on account of breaks in the ditch and flumes.

HAGER & HAAS, at Junction City, cleaned up \$1,200 from a run of only six days.

Some of the Uses of Leather.

A voluminous and most interesting article might be written on the subject which heads these lines. It is a fallacy to believe that leather is used for hoots and shoes, harnesses, carriage-tops, belting, hose, and the like only—these are only a few of the multifarious duties which leather, in one shape or another, has been made to perform. Let us see. Besides for the uses enumerated, which may properly be called the leading ones, leather is now coming largely into use in the manufacture of jewelry. A late number of the *Bazaar*, published in Boston, has an interesting illustrated article on this subject, and *Die Gartenlaube*, a short time since, gave a detailed account of a new branch of industry which has recently sprung up in Vienna (since the Exhibition), viz., the manufacture of leather jewelry, on a large scale. Leather flowers and imitations of fruits, especially clusters of grapes, have long been popular, and the manufacture of them has long been a favorite and pleasant occupation with many of our ladies, who use their handiwork in the embellishment of picture-frames, brackets, work-boxes, and a hundred other articles of *bijouterie*. In the manufacture of clothing, leather enters to a great extent into the domestic necessities of the populations of Northern Europe, especially Russia and the upper part of Sweden; and how far leather enters into the manufacture of trunks, valises, and other traveling requisites, Newark, in America, and Vienna and Barcelona, in Europe, can furnish suitable examples. In the manufacture of fancy articles, leather of the finer qualities is extensively used, and the Vienna and Paris goods of this class are world-renowned. Leather tapestry, which was, a century ago, very fashionable in Europe, is again coming into vogue. It is, without exception, the most durable tapestry in existence, the famous *Gobelins* not excepted. All who have visited Versailles and St. Cloud (before the latter place was destroyed) must have admired the handsome leather tapestry which covers some of the rooms, although, on account of its age and peculiar graining, and the gilt figures with which it is partly covered, it is often mistaken for wood. For the covering of furniture, leather was formerly much more extensively used than is at present the case. It was both handsome, durable, and did not, as silk and costly velvet covering do, "wear out." In the "thirty" war the soldiers from the Duchy of Hesse wore cuirasses made of leather, lined with a thin steel plate; and there is at least one authentic instance on record of a ship having been "plated" with leather, viz., the French gunboat "Provence," which was used in the Crimean war. But she was not a success, and besides, this mode of plating (it was rubbersheets and leathers placed in layers, alternately), was found to be very expensive. In Greenland, the *catways*, or boats, of the native Esquimaux are made of tanned hides of the seal and walrus, which are stuffed or impervious to water, and there are in the United States Patent Office upward of a dozen patents for "portable boats." Of late years, however, rubber is used almost exclusively for this purpose, and the leather boats are obsolete, the patents, with one or two exceptions, have expired long ago.

But perhaps the most curious use to which leather was ever put is in the manufacture of cannon. How often and with what success it has been employed for this specific purpose, we are not prepared to say, but that it has been so used is an historical fact. There is in the Royal Arsenal in Copenhagen, a leather gun—the only one now left of a battery of twelve, which Charles XII brought over from Sweden, to use in his attack against Copenhagen. The idea is said to have originated with the king himself, who wanted light guns for use in the mountains, and easy of transportation during his numerous campaigns. The gun we refer to has the appearance of an ordinary field-gun or howitzer, and is mounted in the same manner. It consists of a smooth steel tube, closed at the bottom, and tightly wound round, up and down, spirally, with tough leather straps or bands, about two inches in width. This accumulation of bands is covered with a piece of leather which, through use and age, has become black and shiny, and the gun looks at a short distance like an ordinary old-fashioned bronze six-pounder. About midway, slightly nearer the rear end, is placed a stout iron or steel ring, which carries the trunnions. The whole weight of the gun is less than one-third of what an iron cannon of the same calibre would weigh, and it was therefore admirably adapted for the use to which the fighting king of Sweden put his battery of leather guns on the particular occasion when he carried them across on the ice, from the seaport of Malmo, in Sweden, to Copenhagen, a distance of sixteen miles. What has become of the other eleven guns we do not know. But this one remains, at least, as evidence that the manufacture of guns of leather has been attempted far back in history, although with what degree of success history fails to inform us. For all that we know, the other eleven which made up this strange battery of "light artillery" may have, one by one, or all in a heap, exploded!—*St. Crispin*.

Few people are aware of the extent of the work done on the North Pacific Railroad, over in Marin county. The company expect to have the cars running from Sausalito to San Rafael in six weeks. They have enough iron on hand for seventy miles of road, and expect to run their cars to Tomales before the season closes.

What is Jet?

What is jet? This is a question often put, but never satisfactorily answered. Nearly all the jet workers have an opinion on its origin, and most of them, in common with the greater part of the inhabitants of Whitby and its neighborhood, believe it to be of ligneous origin. Some, however, believe it to be of mineral origin, and others think it combines the two. Taking the opinion of Mr. Martin Simpson, the curator of the Whitby Museum, who has studied the geology of this district exceedingly well, and with whom I have talked on this subject, he puts his theory as follows: "Jet is generally considered to have been wood, and in many cases it has undoubtedly been so; for the woody structure often remains, and it is not unlikely that comminuted vegetable matter may have been changed into jet. But it is evident that vegetable matter is not an essential part of jet, for we frequently find that bone and the scales of fishes have also been changed into jet. In the Whitby Museum there is a large mass of bone, which has the exterior converted into jet for about a quarter of an inch in thickness. The jetty matter appears to have entered first into the pores of the bone, and then to have hardened, and during the mineralizing process, the whole bony matter has been gradually displaced, and its place occupied by jet, so as to preserve its original form."

With this latter opinion I am inclined to agree, for jet has the appearance of a substance that has distilled from the rock, and in some cases has impregnated vegetable, and in other cases animal substances, while in others it has simply filled up a fissure in the rock, and solidified. In some specimens I have seen the grain, apparently of wood, distinctly; in others, scales and bones of fishes; and in one of the best specimens that has been found here, the mass in form and structure was that of a tree, with bark, knots, and roots, and in the curled portions of the roots, stones and soil conglomerated were imbedded.

That it has been formed from distillate from what is called the jet rock is supported by these facts. Experiments tried on portions have been successful, and proved that at least ten gallons of oil could be extracted from one ton of the shale, and that this pure oil gave out a clear and brilliant light when burnt. A piece of jet on fire gives out a similar brilliant, clear light. Again, the substance is always found in seams, detached, and in a horizontal position, and spreads itself out in shallow layers, as water or fluid substances always do. The two kinds with which we are acquainted are the hard and soft; these are evidently of different species. The jet rock occurs in the twenty foot formation. This formation, commencing at the peak about eight miles south of Whitby, traverses the whole coast to about fifteen miles north of Whitby, and from the hold and precipitous cliffs that skirt the sea to Tees' mouth. The rock divides into the upper and lower lies, with a marlstone series intervening, in the upper part of which we have the Cleveland ironstone. Then comes the dogger or jet rock, and it is here that our hard jet is found in compressed masses of layers of various lengths and thicknesses, some having been found from an inch or two long and one-eighth thick, to masses thirty inches wide, six feet long, and four inches thick. It appears that the largest piece ever found was six feet four inches in length, four and a half to five and a half inches wide, and one and a half thick, weighing eleven pounds and a half. The net price was ten guineas; for this sum it was offered to the curator of the British Museum; he declined to purchase it, and the specimen was afterwards sold for fifteen guineas, and cut into four inch crosses.—*Artisan*.

THE COAL MINES OF WYOMING.—Rock Springs is a coal mining town, situated about 325 miles west of Cheyenne, on the Union Pacific Railway. Its elevation is 6,280 feet above the sea. Coal was first mined there in November, 1868, but not much was done until the year 1869. Since that time the place has developed unlimited resources, and the Wyoming Coal and Mining Company now work two slope mines and one shaft, and take out an average of 200 tons of coal per day the year round. But some months the average is largely over that amount. In December, 1873, over 6,500 tons were mined, and in January, 1874, over 5,800 tons. This company employs 125 miners at Rock Springs, and about the same number at Carbon, 174 miles east of that point, and at Evanston about 40 or 50, where they also have extensive mines.—*Denver Tribune*.

In a late number of the *Annales des Mines*, M. Rozan has described a process for the desilverising and refining of lead by steam. The process consists in using steam to agitate the lead melted in kettles, both to refine the metal and to hasten the formation of the rich silver-lead. This process obviates the necessity of stirring the molten metal by hand or machinery. The advantage claimed for this method are diminished cost of refining the lead and less oxidation of the same.

Two hundred thousand dollars was the amount realized from the last clean-up in the Union Hill claim, Trinity county.

MINERS everywhere in Trinity county are at work with all the water they can use.

GOOD HEALTH.

Root Filling of Teeth.

Dr. Hirsche says, in the *Dental Cosmos*: Many of the most experienced and able members of the profession still advocate the use of solid gold filling in roots as the best and most reliable method. Admitting the value of such a filling, I think we can, at present, entirely do without it.

One object in filling the pulp canal is to prevent the collection of fluids, and to avoid the deleterious effects resulting therefrom. If we can accomplish this more readily by cheaper processes, it is our duty to do so.

This, however, is not my main reason for objecting to gold fillings. Observation has taught me that many times periostitis, and even the loss of the tooth, ensues, when the operation has been performed in the best manner and by the most experienced dentists. I therefore resolved at the commencement of practice to attempt another method, not being aware at that time that this practice was being used by others.

Considering the relations of dentistry to the public, and those of the latter towards dentistry, it is not surprising that at the present time, in Germany, we have a larger proportion of dead and exposed pulps to treat than have our colleagues in America.

I shall not dwell upon the preparatory steps necessary to be taken in different cases, as these are familiar to the profession; but when the root is in a proper condition for filling, I proceed as follows:

Select a thread of lint, separate or loosen the fibers as much as possible, and then moisten it with chloride of zinc from the cement boxes; then rub oxide of zinc well into it, omitting one extremity of the lint, which is reserved for the application of a small quantity of carbolic acid. The thread is simply the medium for conveying the cement to the extremity of the canal, and is entirely imbedded in it. The end of the lint saturated with carbolic acid is, of course, the first inserted, and is carried directly to the apex. After the root or roots are filled, the cavity in the crown is temporarily closed with cotton and sandarac, and an appointment made with the patient several days subsequently. If, in the meantime, the tooth has been perfectly comfortable, and the patient in a healthy condition, I insert a gold filling in the crown cavity. If, on the other hand, the pulp has been deprived of vitality for a long period, and the tooth easily irritated during preparatory treatment, I fill the cavity with cement and dismiss the patient for the time. By operating in this cautious manner, I am able to assert that I never had periostitis occur in the large number of teeth treated in this manner.

As none of these teeth had given any trouble, I never had an opportunity to satisfy myself in regard to the condition of the root and the filling, until, by an unfortunate accident, a young patient split off the labial surface of a first superior bicuspid, treated in this manner two years previously. The tooth was extracted, at her request. On splitting the root to the apex, I found, as I expected, the filling hard and perfect, and the periosteum in a healthy state.

NOT ENCOURAGING.—In a paper read to the Paris Academy of Medicine, the necessity is argued of preventing perfumers from selling poisonous or dangerous articles, which should be left exclusively to the responsibility of regular chemists, and not sold without a physician's prescription. Arsenic, the nitrate of mercury, tartar emetic, cantharides, colchicum and potassa caustica, are common ingredients in these cosmetics. The so-called lettuce soap does not contain the slightest trace of lettuce; and this and other soaps are colored by the sesquioxide of chromium; or of a rose color by the sulphuret of mercury, known as vermillion. The cheaper soaps contain thirty per cent. of insoluble matter, as lime or plaster; while others contain animal nitrogenous matter, which having escaped the process of saponification, emit a bad odor when its solution is left exposed to the air. The various toilet vinegars are also declared in this paper to be so full of noxious, that being applied to the skin still impregnated with soap and water, they give rise to a decomposition, in consequence of which the fatty acids of soap, being insoluble in water, are not removed by washing, become rancid and cause chronic inflammation of the skin.

A CURE for catarrh is as follows: To an ounce of glycerine add fifteen or twenty drops of carbolic acid, and thoroughly apply with a small sponge, to be found at all drug stores, known as the ear sponge. The stimulating and antiseptic properties of the carbolic acid combined with the soothing qualities of the glycerine, are said to produce the most happy results. This remedy also affords immediate relief to an ordinary cold.

Pure glycerine should not produce, when locally applied, a burning sensation, which it always does when the fatty acids are not extracted. But even absolutely pure glycerine, when undiluted, is a water-extracting body. It should, therefore, when used as a cosmetic, or for medical application, be always diluted with water.

TRUE ECONOMY OF LIFE.—The true economy of human life looks at ends rather than incidents, and adjusts expenditures to a moral scale of values. The real wastes of life are not those men prate about most volubly and condemn in censorious tones. De Quincy pictures a woman sailing over the water, but awaking out of sleep to find her necklaced untied and one end hanging in the stream, while pearl after pearl drops from the string beyond her reach; while she clutches at one just falling another drops beyond recovery. Our days drop one after another from our too careless holding, like pearls from a string, as we sail the sea of life. Prudence requires a wise husbanding of time to see that none of these golden coins struck in the mint of God's own eternity are spent for nothing. The waste of time is a more serious loss than the extravagances against which there is such loud acclaim. Here are thousands who do nothing but lounge and carouse from morning till midnight—the droves in the human hive, who consume and waste the honey honest workers wear themselves out in making, and ineffectually dissipate in making and debauch. Here are thousands idle, frivolous creatures, who do nothing but consume and waste what honest hands accumulate, and notice others to lives as useless and worthless as their own. Were every man and woman honest toilers, all would have an abundance of everything and half of every day for recreation and culture. The expenditure of a few dollars for articles of taste and virtue is a small matter in comparison with the waste of months and years by thousands who have had every advantage society could offer, and exact every privilege it affords as a right.—*Herald of Health.*

RHEUMATISM IN WHALES.—There is, unquestionably, a great deal of unknown and unrelieved suffering in the world. If want of sympathy and difficulty of finding relief add much to physical distress, it is sad to think of the new field of woe on the largest scale, which Dr. Strnthers has discovered in hitherto unexplored regions of pathology. In studying the osteology of whales, he has discovered that they are very liable to rheumatism. He has seen many examples of rheumatic otitis in whales of different kinds. It has been said that animals are not subject to disease until they are brought into connection with man, but this fact contradicts the theory. It is the more remarkable, seeing that whales are less subject than man to variations of temperature. The cold-water treatment does not seem to be efficacious in the cure of the disease.—*Jour. of Chemistry.*

ACTION OF ANTISEPTIC SUBSTANCES UPON VIRUS. M. Davaine has recently examined the following substances, which he classes in regard to their power as antiseptics in the subjoined order: Ammonia, silicate of soda, ordinary vinegar, and carbolic acid; then caustic potash, chloride of oxide of sodium (?), hydrochloric acid, permanganate of potash, chromic acid, sulphuric acid, iodine. The power of ammonia, of vinegar, and of carbolic acid being represented by 1—200, that of iodine would be by 1—12,000. Iodine should therefore be considered as the best antiseptic to be employed in the treatment of maladies, such as malignant pustule, boils, carbuncles, and the like, when, not having become localized under the form of a simple pustule, they have taken up a certain extension. Injections of 1-6000 of iodized water are recommended.

COOLING DRINKS.—A good substitute for lemon-juice is tartaric acid. This is the sour principle in wines, and is made from the deposits in wine barrels, which is tartrate of potash. Cream of tartar or bi-tartrate of potash is also used to acidulate drinks, but objectionable for the reason of the amount of potash it contains. The best substitute of all is the crystallized citric acid itself, as it is extracted by chemical means from the fresh lemon juice. The lemonade made from it is equivalent to that of lemons, especially when flavored with a piece of lemon or orange-peel; and if this cannot be had, a single drop of the oil of lemon. As the crystallized citric acid is very powerful, it takes very little to acidulate a large quantity of eager-water. As the taste differs in different individuals, it is best to mix by trial, gradually adding acid and sugar to the water until suited.—*Ex.*

CONTRADICTIONS.—The life of a physician is a life of contradictions. He is misrepresented, abused and derided; yet he is sought for with avidity, and freely received into the bosom of families. His opinion can blanch the cheek, or enfeeble the eye with tears of joy; and his lips are as closely watched as if from them proceeded the issuance of life and death. He lives by the woes of others; and while he would starve, if confined to the profession, if constant health were the attribute of our race, he is endeavoring to banish sickness from among men. While success in his avocation would ruin him forever, he is always warring against his own interest.—*Boston Journal of Chemistry.*

A REMEDY FOR HYDROPHOBIA.—Professor Mauch recently presented to the Philadelphia College of Pharmacy a sample of *trompatilla*, a new remedy for hydrophobia, from Mexico, where it is said to have been successfully used in the cure of the terrible malady mentioned. It is administered in the form of a decoction. *Trompatilla* is obtained from the stems and branches of *Bouvardia triphylla*.

USEFUL INFORMATION.

Preservation of Wood.

In attempting to protect wood from the action of the weather, or of the moisture of the soil in which it is buried, two points have to be taken into consideration. First, to find a suitable preservative material; and secondly, to invent a simple and practical method of introducing this material into the wood to a sufficient depth. The latter has been accomplished by Boacherie by the weight of a considerable column of liquid, while Breant, Floury, Personnet and others preferred to exert a pressure in closed vessels. But, so far, less success has attended all attempts to find a suitable preserving fluid. Some, who ascribed the decay of wood to the action of animal and vegetable parasites, have sought to impregnate it with poisons, such as the chloride of zinc and sulphate of copper. The latter substance is still used by a few corporations in France; but all such soluble salts can act only for a short time, since rain and the moisture of air and soil necessarily dissolve them out after a while. Others have taken patents for impregnating them with insoluble substances precipitated in the wood by the successive action of two soluble substances. Among the latter are phosphate of iron, sulphate of baryta, silicate of iron and the like. These methods have in general one common disadvantage—that the acids set free by this mutual decomposition and precipitation attack the fiber of the wood, and hence none of these have remained in use. More recently the saturation of wood with creosote was adopted and practiced in England. This does, indeed, prevent decay, but does not harden the wood. The process is expensive, the operation difficult, the apparatus costly, much time is required, and the liquid requires to be analyzed frequently to ascertain whether it is still in good condition; and besides all this there is great danger of fire.

A manufacturer of Nancy, France, named Hatzfeld, had long been considering why it was that oak lasted longer than other wood. In 1830 some oaken piles which had been buried since 1150 were dug up in Rouen; they were not only as black as ebony, but wonderfully hard. Hatzfeld referred this property of oak wood to the large quantity of tannic and gallic acid contained in it, and is of the opinion that the abundance of tannic acid produces an effect upon the fibers of the wood analogous to that of tanning on animal hide, forming a hard, insoluble and impenetrable compound, which can resist, without change, the influence of heat and moisture. Chemistry had long before referred this dark color to a union of the gallic acid of the wood with iron, of which there is more or less present in all soils. This tannate and gallate of iron Hatzfeld considers the best preservative against decay. He therefore proposes to impregnate the wood with tannin, and afterward with acetate of iron, and thus to place the wood in the ground at once, in the same condition, to some extent, as that which had been taken out of the earth after the lapse of three centuries. The method has the advantage of being cheap, while the acid used does not attack the fiber of the wood. At the present time a French telegraphic company are testing the new process on a large scale, on the Nancy-Vezelise line, the poles being prepared at Nancy under the direction of Hatzfeld himself.—*Jour. of Ap. Chem.*

A CAR-LOAD.—What constitutes a car-load? As a general rule, 20,000 lbs. or 70 barrels of salt, 70 of lime, 90 of flour, 60 of whisky, 200 sacks of flour, 6 cords of hard wood, 18 to 20 head of cattle, 50 to 60 head of hogs, 80 to 100 head of sheep, 9,000 feet of solid boards, 17,000 feet of siding, 13,000 feet of flooring, 40,000 shingles, one-half less of hard lumber, one-fourth less of joists, scantling and all other large timber, 340 bushels of wheat, 360 of corn, 680 of oats, 400 of barley, 360 of flax seed, 360 of apples, 430 of Irish potatoes, 360 of sweet potatoes, 1,000 bushels of bran. The foregoing table, which we find in the *St. Louis Times*, may not be exactly correct, for the reason that railroads do not exactly agree in their rules and estimates, but it approximates so closely to the general average that shippers will find it a great convenience as a matter of reference.

GOOD IDEA.—The new army boot, introduced into the English service by Sir William Palliser, a distinguished English soldier, gives general satisfaction after undergoing a severe trial by several regiments, both at home and abroad. One feature of the boot consists in placing two thin slabs of cork, reaching from toe to heel, underneath the inner sole of the boot, which renders the sole quite impervious to wet. The object of employing two slabs is in order that the cork in one slab may cover any flaw which may exist in the other.

VARNISH FOR WOOD CARVINGS.—The following is recommended for this purpose by a foreign authority. One part of gum-shellac is dissolved in three to four parts of alcohol of 92 per cent. mixed with one part of water, filtered, pressed, and the solution distilled until all the alcohol is evaporated. The gum which is precipitated from this solution is dried on a water bath and dissolved in double its weight of alcohol of 96 to 98 per cent.

THERE are eighty-seven students studying practical and theoretical metallurgy at the Missouri School of Mines, Rolla.

Leather Cardboard for Roofing Purposes.

A French writer, discussing the respective advantages of the several varieties of paper roofing lately introduced on the continent, says:

Although the advantages of bitumen cardboard for covering slight or temporary structures are generally known, many inconveniences arise from its use. Its rapid decomposition and want of solidity when the oily parts of the bitumen evaporated, necessitated such frequent recoating that the system became expensive rather than economical. A new substance has, however, been lately discovered, known as leather cardboard, which from its solidity, suppleness and durability, seems likely to supplant the old method of roofing. It is composed of solid and tough materials, cemented together by an oily and dashable plastering, with which they are thoroughly impregnated, thus producing a substance entirely water-proof and far more lasting than bitumen cardboard, which, formed as it is of a spongy, compressible matter, and only covered with a thin layer of pitch, obviously possesses neither of the qualities essential to any material for roofing—that is, absolute impenetrability added to great powers of resistance.

The leather cardboard, on the contrary, is so waterproof and tenuous in its composition that atmospheric changes have no effect upon it; it can bear the most intense heat and cold without injury, and is capable of resisting not only the heaviest rain, but also the effects of continuous snow.

Being of light weight and easily fixed, the leather cardboard has the advantage of being far more economical than ordinary methods of roofing with zinc, tiles or slate.

Employed, as it has been for several years, as much in private structures as for camps and public edifices, its advantages have been proved by experience, and ten medals awarded to the inventor at different exhibitions have justly recompensed the improvements he has effected.

The cardboard should be laid on planks of wood, touching each other, and at an inclination of about five inches. The hands of cardboard should be unrolled lengthwise on the roof, commencing at the gutter, and going gradually up to the top.

Care must be taken to stretch the cardboard well, and to make each sheet lap over the other above two inches, securing them by nails at intervals. The whole is ultimately fixed from the top to the bottom of the roof by little wooden lintels, less than an inch wide, nailed at a distance of about 18 inches from one another. A coating of hot pitch should then be applied.

The sheets of leather cardboard being sanded only on one side, care must be taken to fix the smooth side to the planks. The price varies according to the thickness of the sheets, but is much the same as that of ordinary cardboard.

MAKING FAT PERSONS LEAN.—Drink only water, or for a change, water with a little vinegar; no beer, or any malt liquors; no wine, soup, broth, milk, and especially no sugar or starchy preparations; no fine flour, no fat meat, no butter, no cheese, no sweetmeats. Now we expect you will ask, what is left for them to eat? We answer, plenty of fresh fruit and green vegetables, especially salads, bread and unbolted flour without yeast, and no animal food except lean meat, smoked beef, tongue, etc. As carnivorous animals are never fat, it proves that starchy food is the main enemy to be avoided.

SLUGS AND SNAILS.—A correspondent of the *London Field* suggests an easy and, he says, most effectual way of getting rid of these garden pests, namely: Put small heaps of bran (about two handfuls) close to the plants which they destroy most, and then, about 10 or 11 o'clock at night, go round and put a handful of quicklime on each heap; the number of slugs found killed in the morning will be almost incredible. Slugs prefer bran to any fruit or vegetable, and will congregate on these heaps from all parts of the garden.

BLEACHING BY MEANS OF OZONE.—A French chemical journal states that M. David, in bleaching with ozone, employs for this generation of the gas a mixture of potassium permanganate, manganic dioxide (binoxide of manganese), and sulphuric acid contained in carboys; air is passed over the mixture, and after becoming impregnated with ozone is led into a brick tank containing the substances to be bleached; after several hours' exposure to the air, cotton, flax, rags for paper-making, etc., are sufficiently bleached.

COAL SHAFTS.—The deepest coal shaft in England is the Dunkensfield, 2,060 feet, took ten years time to sink, cost \$500,000, and this to reach a bed of coal only 4 ft. 8½ inches thick. The deepest in America is said to be the Hickory shaft, 666 feet, sunk in 428 working days, cost \$100,000. In Virginia the coal lies 60 feet above water level. It costs but a few thousand to open up, it being merely necessary to remove the debris.—*Coal Trade Jour.*

DETECTION OF ACETIC ACID IN WINES.—M. Kissel says that, in separating acetic acid from wines by distillation, the acid may escape undetected, because it forms acetic ether with the alcohol. This inconvenience may be avoided by saturating the wine with baryta. The alcohol is then distilled off, and phosphoric acid added to the residue. On distilling again, the acetic acid is found in the distillate, and may be determined.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Sticken River Country; Pacific Rolling Mill Improvements, 241. Beer-Drawing Attachments for Casks; Quicksilver in Hydraulic Mining; Placer County Mines; Trial of California Steam Fire Engines; A Useful Implement, 248. The Mining Commissioner's Report; Quicksilver; Improved Arrangement for Loading and Unloading Wagons, 249. Patents and Inventions, 253.

ILLUSTRATIONS.—Map of Sticken River and Cassiar Mines, 241. The Fall's Apparatus for Loading and Unloading Wagons, 249.

SCIENTIFIC PROGRESS.—Storms, Fogs, Cyclones; Scientific Notes from the French Academy; Vegetable Physiology; On the Manufacture of Alloys of Iron; A Curious Illustration of Capillarity, 243.

MECHANICAL PROGRESS.—Marvels of Mechanical Skill in Metal Working; Improved Machine for Scutching or Scraping Hogs and Scaling Fish; Wire Rope; Compressing Cast Metals; An Improvement in Inside Window Blinds, 243.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 244.

MINING SUMMARY from various counties in California, Oregon, Colorado, Utah and Nevada, 244-5.

GOOD HEALTH.—Root Filling of Teeth; Not Encouraging; True Economy of Life; Rheumatism in Whales; Action of Antiseptic Substances upon Virus; Cooling Drinks; Contradictions; A Remedy for Hydrophobia, 247.

USEFUL INFORMATION.—Preservation of Wood; A Car-load; Good Ideas; Varnish for Wood Carvings; Leather Cardboard for Roofing Purposes; Making Fat Persons Lean; Slugs and Snails; Bleaching by Means of Oxalic Acid; Coal Shafts; Detection of Arsenic Acid in Wine, 247.

MISCELLANEOUS.—Victoria Mines; Palisade District; More Hydraulic Diggings; Sierra County Mines; Cherry Creek; Mines of New South Wales; Our Naval Efficiency; A Mineral Exchange in St. Louis, 242. Gold at the Vienna Exposition; Del Norte Mines; Mining Discoveries in Arkansas; Some of the Uses of Leather; What is Set? The Coal Mine of Wyoming, 246. The Woolen Mills of the Pacific Coast and what they did in 1873; New Mode of Marine Propulsion; Strong Piping; Page & Panaca; Oro Fino Ledge; Grass Valley Mines, 250. Coal in Monterey; A Heavy Land-Slide, 251.

Beer-Drawing Attachments for Casks.

Samuel Marks, of this city, has recently patented, through the SCIENTIFIC PRESS Patent Agency, an attachment to a cask or other vessel, by means of which beer, ale or porter, under a pressure of gas can be drawn into glasses without the usual excess of foam, but regulated by the operator from brisk sparkling to any extent of foam desired.

A strong glass bottle holding about a quart is attached to a beer faucet, and when turned on, the beer flows into the bottle till full; it is then shut off. The main pressure of gas escapes through a porous plug through which no air enters, thus keeping the bottle hermetically sealed. When a glass of beer is required to be drawn, a small faucet in the bottle is turned on, but it will not run for want of vent. However, by giving the valve of the cask a slight turn, "steam beer" is admitted, forcing out the contents of the bottle into the glass with as much or little cream as desired.

This arrangement obviates the necessity of keeping beer in a pitcher, which rapidly spoils it, as it does when the gas is let off a cask for convenience of drawing. The same bad effect is produced through exposure to the air. Brewers are blamed for bad quality of beer when it is spoiled in process of drawing.

Marks & Armstrong have these attachments in operation, on trial, at their brewery, on the corner of Fourteenth and Folsom streets. One of them is for porter and one for cream ale. The latter can be drawn bright, and as creamy as desired, and the porter just as though bottled in good condition. It is their intention to supply their customers with the use of the attachments without charge, and they expect to have them for distribution during this month. One novel and useful application of the patent attachment is, to fix one on the counter and connect it with the cask by means of hose from under the counter, or cellar, thus supplying the place of the ale pump.

The greatest velocity of wind registered at any time on Pike's Peak, has been eighty miles an hour. This took place during a severe snow storm, and the frost work collected so fast upon the machine that it had to be taken down.

Quicksilver in Hydraulic Mining.

The cost of quicksilver has always been a serious item in the expense of hydraulic mining, and more especially is this the case, now that the price of that article has nearly doubled. It is probable that a much larger quantity of quicksilver is used in hydraulic mining than is necessary to accomplish the object sought to be attained, and that reduction may be made in the quantity and a great saving of expense thus effected, at the same time obtaining an increase of yield of gold from the same amount of auriferous gravel.

Quicksilver is used to arrest and hold fine particles of gold, which, on account of their peculiar shape and the large surface in proportion to their weight, are liable to be carried by the water through the sluices and lost to the miner. In order to effect this object it must be in such a position as to permit the gold to come in contact with it. Every miner is aware that after he has put "quicksilver" in his sluice, in a very short time considerable of it disappears; and more especially is this the case where the gravel is heavy and causes much jar in running through the flume, loosening the riffles sufficiently to allow the "quicksilver" to sink to the bottom, where it becomes worthless for the purpose for which it was used.

The loss of quicksilver in consequence of its tendency to flow is a very serious one, and from this cause also much of that in use fails not only to subserve any useful purpose, but is irrevocably lost to the miner. In mill operations, instead of relying altogether on paddles of quicksilver, copper plates are used, having an amalgamated surface. In hydraulic mining these would be inapplicable on account of the rough usage they would be subjected to and their consequent liability to be rapidly worn out. This would be the case in a main flume and in a primary undercurrent, but in a secondary undercurrent, they might be used to great profit.

This principle of using an amalgamated surface, instead of pure quicksilver, may be carried out in another way in the near future with the result above referred to, viz.: a decrease of expense and increase of profit. Mr. R. Hoskins, of Dutch Flat, suggests a way in which the experiment may be tried cheaply and effectually. He writes us that he has made some experiments in this direction with satisfactory results. His suggestions are as follows:

Take a few pounds of pistol bullets: flatten each a little, making it cheese-shape to prevent rolling. While hot, amalgamate them thoroughly. A small quantity of "quicksilver" will serve for a large number.

Put no "quicksilver" in the lower end of the flume, but instead of it place these amalgamated pieces of lead. Each of these is fully equal to the same area of surface of pure "quicksilver," and there is little danger of their being lost. They will each one serve as a nucleus, around which particles of gold and quicksilver which have passed through the upper boxes, will accumulate. When about to clean up, first crease up the bullets, and, if you find that each one has a shell of dry amalgam, the bullet being the kernel, there can be no question but that the experiment is a successful one.

True, the gold when returned will be somewhat black, but this will detract little or nothing from its value; better have black gold than none at all. If the experiment is satisfactory, the principle may be carried out more fully. If lead is objected to, copper may be used, but lead will do to try the experiment with. The cost of maintaining a certain extent of amalgamating surface as compared with using pure quicksilver, will not be one-tenth. The area will not only be maintained but will increase as amalgam accumulates. The quick which has been floured in the boxes above and is passing off, will be arrested and saved, and serve to keep the surfaces well charged.

An interchange of ideas and experiences on such an important topic can not but ultimately result in a great gain to the mining community. Mr. Hoskins earnestly desires others to experiment and report the results. The columns of the PRESS are always open for the discussion of such subjects, and we hope to hear soon from other miners. While there are plenty of books on quartz mining, and plenty of information concerning it, very little is published concerning hydraulic mining; and if some few miners would give the result of their experience it might induce others to do likewise, to the benefit of all.

SILVER CORD.—A letter from the Silver Cord superintendent, April 5th, 1874, says: Works in 110-foot level are completed, timbered and track laid 112 feet from shaft. Will commence to stope in a few days. Contractors in 200-foot level will finish 100-foot contract in four or five days; track laid, and will commence stoping immediately. Shaft down 115 feet for third level, which will open a large body of high-grade ore; notwithstanding, we have a large quantity of ore in 200-foot level and also in 100-foot level, all of which can be mined for \$3.50 per ton.

COLUSA QUICKSILVER.—The Colusa Sun says that Messrs. Hart, Goad, Ingram, Heath and Brim have purchased a controlling interest in the Abbott mine, and will proceed with work immediately. There are now three rich mines in the vicinity—the Abbott, the Buckeye and the Elgin, with its extension or jump.

Placer County Mines.

Hydraulic mining in this county is now in full operation. The deep diggings at Dutch Flat and Gold Run are being worked with confident hopes of a rich harvest this season by their owners. It is probable that the water season will be a month longer than last year with all ditches, with a prospect that the Yuba river ditch will run the year through. Most of the ground in these mines has been worked from 75 to 150 feet or more in depth without coming to the bed rock. And now in order to wash to the bed rock, and thereby realize the best pay at the bottom, the Cedar Creek Tunnel Company are running a large tunnel from a point in Bear Valley canon low enough to drain all Dutch Flat claims, embracing, perhaps, two miles of auriferous channels. They use two Burleigh air drills, the air compressors being worked by a hurdy-gurdy water wheel under 700 foot fall. The drills here are said to operate well and the work is progressing favorably.

Staples Bros'. Claims

Are now piped with 350 feet pressure of water, and may hereafter have over 500 feet fall. They cleaned up \$5,000 after a thirty days' run last season.

The Gold Run Ditch and M. Company's Tunnel Enters the side of a steep ravine, below the Gold Run diggings. Its projected depth is 2,200 feet; size, 10 feet high by 12 wide. Has already been run 600 feet since its commencement last August. They latterly made 26 feet per week in the main tunnel. A tunnel of 1,000 feet, branching off to the Indiana hill claims, is the work now being pushed. Forty-two feet were recently run in a week. This is accomplished in hard bed-rock by the use of

The Burleigh Drills.

Two being constantly in use. A third affords a change while repairing. For compressing the air, a 15-horse-power engine, manufactured with the drills by the Putnam Machine Works, Fitchburg, Massachusetts, is used. The drills are four-pointed, with cutting edge, x-shaped. The holes are started with 2½ in. drills, followed by two-inch drills, and finished with 1½ inches to the depth of about four feet. In the main tunnel 20 holes are made in a facing—four rows of five holes each. Hercules powder and blasting fuse are used. From 3½ to 4 feet of rock is knocked down at each blasting. Seven hours time is required for drilling a set of holes. Removing the rock knocked down comprises a large part of the labor in working the tunnel. Hard tamping, made of clay and sand, baked in the furnace, is used with the best convenience and effect. Electric fuse was tried, but with too weak explosion. Heavier explosives will be used on another trial, and, we presume, prove successful. The drills used have 8-inch stroke. The company have on hand a fourth drill of less calibre. The drills are turned forward to their work by hand (instead of by automatic feed), it requiring an extra hand. About 12 men, including seven Chinamen, are employed, working two shifts.

Mr. Wm. Judd, superintendent, has met with no serious difficulty in introducing and operating these drills. He considers them a great auxiliary to rapid work, and important in such large enterprises.

Mr. J. B. Brisbie, engineer, runs the stationary machinery, keeps the drills in repair, and does other machine work.

Important Improvements.

This tunnel and its branches will facilitate the working of an immense area of ground down to the bed-rock, a large portion of which, at both Dutch Flat and Gold Run, have already been washed on top to the depth of from 100 to 200 feet, showing that the smaller fraction of mining has but yet been done in this section. On the Iowa hill ridge, across the North of the American, a large ditch is nearly completed, which will give increased vigor to that section of Placer county also.

NEW MINISTER TO CHINA.—Benjamin P. Avery has been called to succeed the Hon. F. F. Low, as U. S. Minister to China. The nomination was secured by Senator Sargent, and the appointment has been duly ratified by the President. The selection is a happy one, as Mr. Avery is favorably known throughout the country, as well as this State, as a gentleman of pronounced ability and refinement. He was formerly connected with the *Bulletin*, and latterly has edited the *Overland Monthly*. Several times before it has happened that men of literary pursuits have been selected as foreign ministers. Mr. Avery follows in the steps of Bancroft, Irving, Bryant, Ticknor, Marsh, Hawthorne and Motley, and will no doubt be quite as successful in diplomatic matters as he has been heretofore in the editorial capacity. The appointment has given universal satisfaction in California. Mr. Avery's life has offered no occasion for hostile criticism from either political or personal opponent—he probably has neither—and the press of the State are unanimous in their hearty support and gratulation.

CARSON MINT.—The following is a statement of business transacted at the Carson Mint during the month of March, 1874:

Deposits.	Ounces.	Value.
Gold.....	13,610 255	\$253,214 10
Silver.....	401,062 15	461,458 54
Total.....	414,672 408	\$714,672 55
Coinage and bars executed.....		\$614,698 85

Trials of California Steam Fire Engines.

During the past week two trials of California built steam fire engines took place in this city. One of these was built by Messrs. Goodwin & West, and the other by the Kimball Manufacturing Co. The

Goodwin Fire Engine

Was the first ever built on this coast, and is fitted with the Goodwin Rotary Pump. The trial of this engine took place on Saturday last at the intersection of Ellis & Powell streets. The test was made under the supervision of the patentees, owners and manufacturers, in conjunction with Chief Scannell and the Board of Fire Commissioners. The weather was most unpropitious, as a strong westerly wind was blowing at the time, which, together with the fact that the nozzles used were, as we are assured, of poor construction, tended greatly to cause the steam thrown to split up and break off in spray.

The first trial was made with two lengths of 150 feet each of hose, with 1½ inch nozzles, the dial marking 70 lbs. of steam. The length of this steam was 156 feet, actual tape line measurement. The second trial was an exact counterpart of the first. On the third trial the length of hose was the same as previously, but only one length was brought into requisition; a 1½ inch nozzle was substituted, and the pressure of steam was 95 lbs.; distance thrown, 194 feet. The fourth test was made with 100 feet of hose, a 1½ inch nozzle, 1 stream of water, steam power as before. Distance made, 194 feet 8 inches. The fifth trial was as successful, or in fact more so than any of the preceding, as with 100 feet of hose and 1½ inch nozzle and the same amount of steam, a stream of water measuring 181 feet 9 inches was thrown. Mr. Corbett, the engineer, informed us that the suction was not sufficiently large to supply the pump. An alteration will be made in this and a few minor instances, when another trial of this engine will be made. The engine itself is about the same size as a No. 2 Amoskeag, but the most novel feature in it is the new rotary pump, now used for the first time for this purpose. The engine is very handsomely finished, the whole work having been done in this city. An accident happened to the pump during the trial, and interrupted the experiments.

The Kimball Engine.

Built by the Kimball Manufacturing Company, was tried on Tuesday, at the corner of First and Folsom streets, before a large number of spectators, including members of the Board of Supervisors and the Fire Department. The engine is strongly made and neatly finished. It weighs 6,200 pounds, a little less than a second-class Amoskeag. Working with eighty pounds of steam, the pressure on the water-gauge is 170 pounds. At the trial a stream of water was thrown 225 feet through an 1½ inch nozzle, with 90 pounds of steam. It was tried with two streams, through different sized nozzles. The trial gave perfect satisfaction to all who witnessed it. It is understood that the Kimball Company challenge the Department to bring out its best engine of similar class for trial of quality.

A Useful Implement.

Our esteemed cotemporary, the *American Agriculturist*, suggests that a pair or two of tongs, such as we represent herewith, will be found very serviceable for many uses on the ranch, as well as in country sawmills, where we believe they are already generally introduced. If heavy timbers are to be handled, or fence posts carried, or large stones lifted, there is no implement at once so cheap, simple and convenient. The tongue applied at the base of an old post to be taken out of the ground,

would aid greatly in this frequently tedious work, and there are many other occasions, a self-suggesting, where they would repeatedly pay their cost in one season. They should be made of three-quarter inch iron bar, flattened at the pivotal point; the extremities of the jaws should be steamed and brought to a sharp, flat edge, beveled on the lower side to insure a good grip and prevent slipping. When these tongs are intended to be used exclusively for removing stones, a slight modification in the shape of the jaws might be an improvement; the ends need not be sharpened, but should rather be made as wide and hollow as possible. This plan would give a better hold on the smooth, hard surface or rounded stones. It will be seen that the act of raising the handles, when a log or large stone is to be lifted, creates a powerful lateral pressure of the jaws, proportional to the leverage secured by the construction, thus firmly grasping the object. The many applications of this simple and serviceable device are obvious.

MINING prospects in Idaho are brighter and more promising than would have been hoped for a few months since.

The Inyo Independent says that very fair diggings are reported as having been struck about ten miles westerly from Bishop creek.

THE good weather is giving an impetus to mining matters in the Comstock as well as in other mining localities.

The Woolen Mills of the Pacific Coast and what they did in 1873.

The Capital Invested—Quantity of Wool Used—Value of Buildings and Machinery—Number of Hands Employed—Amount Spent in Wages—Value of Products, Etc.

There is a great future in store for California as a manufacturing country—as great as for any country in the world. We might say, not only for California, but for all the Pacific coast; and one of the greatest branches of that industry, will consist in the manufacture of woolen goods, and of goods compounded of wool, cotton, silk and other textile materials. There are at least two hundred millions of acres that are peculiarly suited to the raising of sheep and the growth of wool, found in the foot-hills of the Sierras, and in the coast valleys of the coast range, extending for hundreds of miles from southeast to northwest, parallel to the great ocean and to the river courses. There is as much country favorable for wool growing on the Pacific slope, as in all the rest of the United States, and the day will come, and that in the near future, when every one of these hills and valleys will be white with millions of sheep. Their wool will not be always exported; it will be manufactured at home amongst us. We have abundance of water power, in the thousands of streams that descend from the mighty Sierras, the Cascades, and the other giant mountains of the Coast, and where water power is not available we have localities adjacent to some of the most productive coal mines in the world, where as busy scenes of industry will be witnessed as are now in the streets of the great manufacturing cities of both New and Old England. In fact, we hazard nothing in predicting that the woolen industry will of itself alone, task the labors of hundreds of thousands of workmen. But we have many things to learn; our farmers have to learn how to produce a fine quality of wool, and how to improve their flocks, and our manufacturers how to produce as fine cloths as are turned out by the looms of France. It does not detract in the least from their enterprise, and from the real merits of the work they have done, to say this; for, considering everything, they have made gigantic progress, and are fast approaching a high state of excellence in the quality of the goods manufactured, equaling, and in many cases excelling, some of the finest productions of the Eastern looms. It is less than a score of years since wool growing first assumed any dimensions in California. Then not more than half a million pounds was produced; but ever since the quantity has been steadily increasing, last year amounting to over thirty million pounds; the Oregon clip amounting to a few million more. Of this there was about ten per cent. used on the Coast. The Oregon wool is generally accounted the finest, although some claim the first place for northern Californian—but Southern California is not so good. Australian, which is used to some extent in our mills, is accounted by many of the millmen better than either. Of all the mills of the Coast,

The Mission and Pacific Mill

Belongs, unquestionably, to the first rank. It was started in 1860, with only two sets of cards, and did not give much promise of the future, which was afterward in store for it. The founder was Donald McLennan, Esq., the present manager, who carried it on successfully in the face of obstacles that would have appalled any ordinary man. The mill is now a twenty-set one, with seven thousand spindles and 87 broad looms. These twenty sets are equal to thirty-six sets, from the manner in which the mill is run. The value of goods manufactured in 1873, was \$1,100,000; this year it will be \$1,300,000, showing an advance of over eight per cent. in one year. There was used altogether 1,800,000 pounds of wool; this year there will be used 2,200,000 pounds. Of the wool used last year, there were 1,400,000 pounds Californian, 300,000 pounds Australian, and 100,000 pounds Oregon. We may say here that Mr. McLennan himself visited Australia a couple of years since in order to select the kind of wool he required for the mill. Besides the wool, there was also 150,000 pounds of cotton used, or about fifteen per cent. of the whole. The department for the manufacture of hosiery, turns out about \$200,000 worth a year, the rest of the manufacture being made up of cassimeres, tweeds, shawls, flannels, blankets, and every variety of woolen goods. Some of the goods appear to be equal in make and finish to any thing imported or foreign, and many of the cassimeres and tweeds are of remarkable beauty. There are here constantly employed 387 white people, and 456 Chinese. Of the white people, 80 are men with families, 85 to 100 boys, and the balance women and girls. The average pay roll is from \$18,000 to \$21,000 per month. Besides the regular employees there is hardly a poor family in the Mission that does not get work that is done at home. Besides this they keep the girls at the Magdalen employed nearly all the time. Including the families of those who get work, there can not be less than from two to three thousand people who are benefited directly or indirectly by the mill. The white men employed earn, on an average, \$2.50 per day; the women from \$3 to \$4.00 per month, and the boys from \$4 to \$7 per week, averaging, perhaps, \$5. This company claim to utilize the labor of boys more extensively than any other establishment in the city,

save, perhaps, those employed in the boot and shoe trade, and the management is disposed to work them in from time to time as fast as opportunity offers. The Chinese employed, earn from ninety cents to one dollar per day. The buildings of the factory on Fifteenth and Folsom streets, are 793 feet long by an average of 50 feet wide, and are two stories in height. The hosiery department by itself is 200 feet long, and two stories in height. Besides these there are a dye house and work-shops and a large stone store-house, 130 feet long by fifty feet wide, two stories high, and capable of receiving two million pounds of wool. On arriving at the factory the wool is first assorted and scoured. Then it is colored, picked, carded, spun, and afterward wove into cloth, blankets, etc. We know of nothing more interesting than witnessing the various processes carried on, and the intricacy and variety of the machinery used. Of the processes just mentioned, the first story is devoted to picking, carding, spinning, and finishing the cloth, and in the second to spinning and weaving. There are about 220,000 yards of cassimeres, tweeds, etc., made annually, which are worth from ninety-five cents to \$1.60 per yard. Every week there is sent from this factory, east over the railroad, a car load of goods, worth from \$25,000 to \$30,000. They work largely for the Government. Their goods go everywhere over the coast, to Japan, China, and British Columbia. The capital of the company, which is a close corporation, is \$650,000. The mill occupies three blocks of land, which were bought at a nominal price, but which are now worth from \$600,000 to \$700,000. The buildings and machinery are worth, at least, \$400,000. The institution is a monument to its founder and a credit to the Coast.

The Pioneer Woolen Mill

Was, as the name imports, the first erected on this coast, and is the great rival of the Mission and Pacific. Located near Black Point, the buildings are altogether four hundred feet long, and are four stories in height. The mill started as a six-set mill; but there are now used in it 19 sets with 7,800 spindles and 67 broad looms. The building and machinery cost \$400,000, and the capital of the company is \$450,000. Last year they used 1,500,000 pounds of wool, worth \$300,000. They made 500,000 yards of cassimeres and 260,000 yards of blankets, etc. The total value of the manufacture was \$750,000. The amount spent in labor was \$30,000, which gave employment to 350 hands, including 100 white men, 25 women, 25 boys, and 200 Chinese. The wool used was principally Californian, with a small amount of cotton mixed. The goods made by this mill are all first class; and they have long had a good trade with New York, it being near three years since they sent the first goods thither. The Pioneer Mills is an industrial establishment that would do credit to any city in the United States.

The San Jose Woolen Mill

Is owned by a corporation organized in 1869, through the labors of Judge R. S. Peckham. The mill was built and put in working order under his supervision, and he is yet President and managing agent of the company. The other officers are James T. Lewis, secretary; A. McLeonard, mill superintendent; and John R. Mason, who acts as agent in this city. The company was organized with a capital of \$100,000 all paid up, but the business enlarging, it has since been increased by subscription to a nominal capital of \$400,000; of which, \$200,000 is paid up. The company has now including money invested in stocks, etc., about \$260,000. The mill, land and machinery cost \$93,000; and is said by all competent judges to be one of the best mills in America. The main building is 52x110 feet and three storeys high, with engine-room attached. They have also a separate building for picking machinery, another for their finishing machinery, besides a store-house, lye-house and several other outbuildings. The mill has six sets of cards, 2,140 spindles, and 24 broad looms. It turns out about 60,000 yards of cassimere, 108,000 yards of flannel, 45,000 yards of tweed, 3,600 pair of white, 3,600 brown and 10,500 pair of grey blankets, per annum. In the manufacture of these goods they use about 350,000 lbs. of the best wool, in the market worth about \$70,000 per annum. The company manufacture about half their cassimeres and flannels into clothing. They give employment to ninety-six persons—77 at the mill and 19 in San Francisco. They expend for labor and commissions on sale of these goods about \$60,000 yearly. Their pay roll at the mill is about \$3,200 per month. Of their employees 25 are white, and 71 Chinese. This company find a ready sale for all their goods in San Francisco. Their blankets are unexcelled; many of their cassimeres are claimed to be equal to those of European importations.

The Marysville Woolen Mill

Was erected in 1868, and will, ere many years have elapsed, make of that city a most important manufacturing center. Its exhibit for the year 1873 was as follows: There were used 330,000 lbs. of wool, worth \$57,000, which were manufactured into cassimeres, flannels and blankets, worth \$187,000. The capital invested is \$127,000, and the cost of buildings and machinery has been \$72,300. There were employed in the mill 47 hands, who are paid \$26,400 a year, or an average of \$56.80 each, per month. The mill, which is built of brick, and one story high, is 160 feet square. The wool used is all Californian.

The Stockton Woolen Mill

Is situated on the south bank of the Mormon Slough, near the city of Stockton; is 50x100 feet, one and a half stories in height, and built of wood. Besides, the proprietors have a store-room and packing-house 60 feet long by 20 feet broad. The mill is the property of Messrs. Lambart, Doughty and Tattersson, and was started in 1870. Last year there was used of wool 300,000 lbs., worth \$75,000, which was manufactured into \$125,000 worth of blankets, flannels, etc. The capital invested is \$50,000, and the mill and machinery are worth \$35,000. The hands number 30, of whom five are white men, three white women, and 22 Chinese. The white men average \$3 per day, the white women, \$1.25, and the Chinese earn \$25 per month. The mill is a two-set one, with 800 spindles and seven broad looms. The wool used is principally Californian, with some Oregon. The proprietors aver that the Oregon wool is of a better quality and has a longer staple. They are able to sell all they can manufacture.

The Capital Woolen Mill

At Sacramento, was incorporated in 1868, with a capital of \$100,000. The mill is located on the corner of C and Sixteenth streets. It is built of brick, and is three stories in height. The main building is 40x30 feet, with an L 60x30. It is a six-set mill, and employs 53 hands. They have a sample-room at 217 J street, which is 160x20 feet.

The Oregon City Woolen Mill

Is, without doubt, the most important manufacturing enterprise in the State of Oregon. It was established in 1865, nine years ago, and ever since has been constantly increasing its production. The factory is a splendid four-story building, with stone basement. The mill started as a three-set one, but is now a seven-set, with 2,300 spindles and 24 broad looms. Last year it used up 500,000 lbs. of wool, which, when manufactured, was represented by 130,000 yards of cassimeres and 420,000 yards of flannels and of blankets. The value of all these is about \$300,000. There are 100 hands employed, of which 70 are boys and girls, and the balance 30 men. The wages paid these in 1873 was fully \$60,000. The buildings and machinery have cost \$100,000. The wool used is principally Oregon. A small quantity of cotton is also used.

The Williamette Woolen Mill,

Is said to be the oldest on the Pacific coast, being established in 1857. It uses 400,000 lbs. of wool yearly, and pays \$8,000 monthly for labor. Of

The Other Woolen Mills,

We can say but little, inasmuch as our circulars to the managers have not as yet been answered. In California, besides those already noticed, there are the Los Gatos and Los Angeles mills, which are both one-set mills. In Oregon there is also a one-set mill at Brownsville.

Synopsis.

The whole number of woolen mills on the Pacific coast is nine, of which six are in California and three in Oregon. They have 20,840 spindles and 232 broad looms. Their aggregate capital is \$2,000,000; the value of buildings and machinery is \$1,525,000; the number of pounds of wool used last year was 5,380,000, of a value of \$1,200,000, and the value of the manufacture was \$3,000,000. Of the wool used, 3,680,000 lbs. was Californian, 1,200,000 lbs. was Oregon and 500,000 lbs. Australian. About 250,000 lbs. of cotton was also used. Of Cassimeres 11,000,000 yards were made, and of blankets, flannels, etc., 1,600,000 yards. The total number of employees was 1,356, of whom 851 were Chinese, 230 white men, 137 white boys, and 138 white women and girls. The wages paid aggregated \$556,400. The value of goods sent East was about \$350,000, and the total exports at least \$400,000. Such an exhibit is highly creditable to the coast, and gives the highest promise of a glorious future for this industry.

NEW MODE OF MARINE PROPULSION.—Mr. J. T. Bowman favors us with sketches and descriptions of an ingeniously and quite novel mode of propelling vessels, which he has lately contrived but does not propose to patent. An opening is made through the center of the ship under the water line, whence, by a snitable conduit, a large stream is allowed to pass to two athwartship revolving blades, which are modeled in form and arrangement after those constructed inside the Root blowers, and which are situated in a suitable enclosure in the forward portion of the hold. From this casing, and leading aft, are three passages, one extending downwards, at an incline, to the keel, and the others leading to each side of the ship. Snitable valves are arranged, whereby the water drawn in by the blower may be diverted into either passage, so that by this means the vessel may be drawn ahead or steered in either direction at will.

STRONG PIPING.—Five hundred feet of the largest wrought iron piping ever brought to this Territory was shipped to the Emma mine on Saturday. It is six inches in the bore, and is intended to be used as a discharge pipe for the new plunger pump. Cast iron is not considered strong enough for the purpose, being liable to break should the mine settle. The new piping cost about \$5 per foot laid down at the mine. The manufacture of that kind of piping requires machinery of extraordinary power. This wrought iron piping is calculated to stand a pressure of 200 pounds to the square inch.—*Deseret News.*

Page & Panaca.

Yesterday, by invitation of D. E. Mitchell, the foreman, we visited the above mine for the purpose of examining the ledge struck within the last few days. We descended the shaft in the cage to a depth of 300 feet, then passed along the main drift a distance of 613 feet, when we came to the head of the winze or incline. Here trouble commenced, for climbing was in order for a depth of 240 feet; however, at it we went, and by dint of looking pretty carefully to our footsteps, and holding tight, reached the bottom in safety. We then went along the drift, which turned in several directions, until we reached our destination, the face of the drift in which the discovery was made. When we reached this point, we were not disappointed, for we found a solid ledge fully five feet wide with well defined quartzite walls. About two feet of it is very rich, assaying, we are told, from \$600 to \$900 per ton. Our courteous and intelligent guide, Mr. Mitchell, told us that the spot on which we were standing was nearly under the summit of the divide west and south from the stone quarry. The presence of so strong and rich a vein in the very bowels of the ridge must leave no doubt in the minds of any that the ledges from which so much bullion has been extracted are true fissure veins, and are as productive at great depths as nearer the surface. In the Page & Panaca ledge there is a stratum of the peculiar reddish, brown ore which is so rich in silver; next to that comes a layer in which streaks, or bunches of galena, are visible, and the remainder shows the ordinary ore of the district.

We must congratulate the company upon at last receiving a return for the long and expensive series of operations they have conducted. We feel sure that the prize they so long sought is within their grasp, and that the Page & Panaca will soon be classed among the heavy bullion producers of Pioche. This discovery will not only be of benefit to the company, but also to Pioche generally; for it leaves no doubt that the great master vein is permanent, that it is to be found at great depths, in the very center of the mountain, and at the same time is very rich. After the exploration of this vein for some distance, we think we shall hear less about "ruined mines" and "Pioche wild-cat," about which the journals at the Bay are so grievously exercised. Besides inspecting the new strike, Mr. Mitchell showed us over the whole works. Everything is progressing in an orderly and workmanlike manner. A drift is being pushed from the upper level directly for the new ledge, and when reached, if it proves rich as it is 240 feet below, the company will not have occasion for any anxiety about pecuniary matters. Arrangements are being made for taking out ore at once. In order to facilitate this, a new shaft will be sunk which will avoid the circuitous route necessary to be pursued through the present workings. We were much pleased with our visit, though it was a laborious task climbing those ladders. We received every attention from Mr. Mitchell and others, and think the company is fortunate in securing the services of so efficient and experienced a miner. In conclusion we must again say that this development will, we think, prove of great importance to Pioche; it will revive drooping hopes and inspire fresh confidence, for it is a convincing and practical demonstration of the permanence and richness of our mines.—*Pioche Record.*

ONE FINE LEDGE.—A very rich strike was made in this mine, located in Sacramento district, about twelve miles south of Unionville, last Saturday. The claim is owned and worked by Messrs. Hope, Bennett, Pollard and Pomeroy, and for the past two years the two first named gentlemen have been steadily engaged in thoroughly prospecting it, during which time considerable rock and ore have been removed, and about three hundred and forty feet of tunnel run. The ledge is situated in the head of the ravine that separates the Montana and Rochester mines, and the course of the ledge is southeast and northwest. Where the vein crosses the ravine, an open cut was run into the ledge, and a tunnel of one hundred and forty feet was run on southeast line of the ledge, showing some very rich mineral, but the vein considerably broken up. Despairing of striking anything in that direction, the owners thought they would try the other end of the claim, and they accordingly commenced in the same open cut and tunneled north about two hundred feet. The ledge on this side also continued broken for about one hundred and fifty feet, when it commenced getting solid, and continued to improve both in appearance and richness until last Saturday morning, at which time the persevering prospectors opened up a four-foot vein of black sulphuretted ore. Many of the pieces broken show considerable free gold. As yet, no tests have been made of the ore, as it was considered unnecessary to assay it, but Mr. Hope tells us that the mine is open for inspection; and he invites any and everybody who desire to see a really magnificent ledge and an immense body of very rich ore to give him a call.—*Silver State.*

GRASS VALLEY MINES.—The Union says: The month of March saw more preparations for work than actual operations, so far as the business of prospecting is concerned. There has been, and is now, too much water in the ground for work in such mines as have not heavy machinery upon them. The water will soon be evaporated by the sun and wind, when prospecting will be unusually active. The opened mines have been working steadily, with fair results.

COAL IN MONTEREY.—A coal mine has been recently discovered within about six miles of this town. During the past month some twenty tons of coal have been taken out, and that with only a small force of workmen. A meeting of those interested in the mine was held at Washington Hall, on Monday last, and a company to be known as the Monterey Coal Mining Company was organized, and the following named officers elected: President, B. F. Sargent; Secretary, A. Mannel; Treasurer, L. Little; Directors, S. B. Gordon, H. Escelle, E. H. Wise, G. G. Harris and B. F. Sargent. The coal is pronounced by experts to be equal to the best Chamberland coal. Our county is greatly excited over the developments made.

A HEAVY LAND-SLIDE.—An extensive landslide occurred on the line of the North Bloomfield Ditch, near Roscoe's ranch, two and a half miles above Relief Hill, in this county, about ten days ago, and did damage to the ditch to the amount of \$2,000. The whole hillside for a width of several hundred feet went down into the cañon below, carrying everything before it. The debris filled the ravine up to a height of sixty feet. Sugar pine trees, eight feet in diameter, were forced along with the soil, and hundreds of cords of wood broken from the trees lie in the ravine below. It will take some time and great expense to repair the damage.—*Nevada Transcript*, April 8th.

A town is to be laid out in the vicinity of the Holcomb valley mines, San Bernardino county.

GRAND INDUSTRIAL EXHIBITION, To be held under the auspices of the **MECHANICS' INSTITUTE OF SAN FRANCISCO, CALIFORNIA,** Opening on August 18th, 1874.

The Board of Managers herewith announce that a grand Industrial Fair will be held in the city of San Francisco for 30 days, opening on August 18, 1874.

In view of the increasing commercial and manufacturing importance of San Francisco, its contiguity to and close connection with the various countries bordering on the Pacific, the managers have constructed a Pavilion having a floor area of 150,000 feet, and have invited to it all who are disposed to come and exhibit. All exhibitors will be placed on the same footing. Motive power will be furnished free.

The building will be open day and evening, and every facility will be extended to exhibitors and visitors. Application for space must be made without delay to the Secretary of the Board of Managers, 27 Post street, San Francisco, and all inquiries will be answered and information extended promptly.

No space can be secured unless applied for before the 20th of July next. A. S. HALLIDIE, Pres. 13v28-3m J. H. CULVER, Secy.

The patriotic Hollanders of this city combined to have a book of photographs of California scenes made, to be presented to the King of the Netherlands on the occasion of the twenty-fifth anniversary of his coronation. The photographs are by different artists and have been selected with much care. The binding was put in the hands of Bartling & Kimball, and is superb. Panels of ornamental woods and specimens of gold quartz adorn the covers, and the photographs within are mounted in the most durable manner. The book is prefaced with an address to the King on the part of his countrymen and late subjects. The whole work shows great taste and skill, and is highly creditable to the binders.

PAIN-KILLER.

1840.

1874.

Time Tests the Merits of All Things.

THIRTY YEARS is certainly long enough time to prove the efficacy of any medicine, and that the Pain-Killer is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a sure and effective remedy. It is sold in almost every country in the world, and it needs only to be known to be prized, and its reputation as a Medicine of Great Virtue, is fully and permanently established. It is the great Family Medicine of the age. Taken internally, it cures Dysentery, Cholera, Diarrhoea, Cramp and Pain in the Stomach, Bowel Complaint, Painters' Colic, Liver Complaint, Dyspepsia, or Indigestion, Sudden Colds, Sore Throat and Coughs. Taken externally, it cures Bruises, Boils, Felons, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost Bitten Feet, etc.

Pain is supposed to be the lot of us poor mortals, as inevitable as death, and liable at any time to come upon us. Therefore, it is important that remedial agents should be at hand to be used on emergency, when we are made to feel the excruciating agony of pain, or the depressing influences of disease. Such a remedial exists in Perry Davis' "Pain-Killer," the fame of which has extended over all the earth. Amid the eternal ices of the Polar regions, or beneath the intolerable and burning sun of the tropics, its virtues are known and appreciated. And by it suffering humanity has found relief from many of its ills. The effect of the Pain-Killer upon the patient, when taken internally in cases of Cough, Cold, Bowel Complaint, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sores and Sprains, Cuts, Stings of Insects, etc., and other causes of suffering, has secured for it the most prominent position among the medicines of the day. Beware of counterfeits and worthless imitations. Call for Perry Davis' Vegetable Pain-Killer, and take no other.

Sold by Druggists and Grocers.

The Pacific Rural Press,

NOW IN ITS FOURTH YEAR.

Is a Large, Handsome, Illustrated, Home Journal. Every Farmer, Gardener, Country Gentleman and Rural Homestead Owner should take it. Every Miner, Mechanic, Manufacturer and Professional man and woman who contemplates agriculture, should read it.

It is worth its price for home reading. Send it abroad and extend a knowledge of our wonderful growing country. Subscription, \$4 a year. One sample copy free. Four copies (postpaid) 25 cts.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, \$2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, \$1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

No. 151 New Montgomery street, SAN FRANCISCO. 11v28-1am-3m

Williams' Swimming Air Machine.

IT CAN BE PLACED AT ANY REQUIRED DEPTH IN A MINE, AND AT THE SAME TIME RECEIVE ITS SUPPLY OF FRESH AIR FROM THE SURFACE.

THE MACHINE IS DOUBLE-ACTING, THEREBY FURNISHING A STEADY, UNIFORM CURRENT OF AIR—PUMPED, MOISTENED AND COOLED BY CONTACT WITH WATER SURFACE.

The cut represents a model of Williams' Swimming Air Machine for Ventilating Mines and Deep Shafts, etc. NO GREASE OR OIL IS USED, thus preserving the air in its pure State.

The Smallest Machine, with a 6-foot stroke, will deliver 3,732,480 cubic inches of cool condensed air in one minute.

In consequence of the swimming of the machine in water, a small amount of power will work it. The inventor is a practical Mining Engineer, and understands the injury to health and strength of miners resulting from hot and impure air, as well as the GREAT ECONOMY of thorough ventilation in mines.

A working model can be seen at No. 13 Drumm street. Mines ventilated, inspected and reported on the most reasonable terms by the undersigned.

Rights to use this machine will be sold on reasonable terms. Address,

WILLIAM WILLIAMS,

P. O. Box 520, San Francisco.

Caveat filed 17th day of January, 1874.

The Mining Bills in Congress.

The mining community is still very much exercised over the proposed amendments to the mining law, now being discussed in Congress. Resolutions have been adopted at several miners' meetings in different sections of the country, deprecating any attempt to change the existing laws, and more especially where the amendments will compel miners to patent their mines whether they want to or not.

During the debate on the Negley amendment in Congress, Mr. Luttrell made the following remarks about our mining patent system: What does it cost to acquire title to land under the present law? In the first instance, a man must place \$500 worth of improvements upon his claim; then he must deposit with the Surveyor-General from thirty-five to one hundred dollars, as I can show to your satisfaction has been done in some three hundred cases; in many instances \$100 were paid, and the average was \$50 to a claim. Then the miner must go and make his contract with the Deputy Surveyor-General, who charges him one hundred dollars for surveying his claim of probably one acre, and making a plot of the same. Then he must advertise in the public prints, which costs him from forty to one hundred dollars more. Then he must deposit with the land officer from twenty-five to fifty dollars in each case. Then he must pay a Notary Public some fifteen dollars. Then his personal expenses amount to from fifty to one hundred dollars. Thus he has paid out on an average, provided he meets with no litigation, eight hundred or a thousand dollars. Of that amount how much does the Government receive? Only two dollars and fifty cents, while the poor miner has been obliged to expend nearly \$1,000, two-thirds of which goes into the hands of officials, and then, if his claim proves a failure, the miner is bankrupt.

How is it with the rich men? In one county in my district, speculators have gobbled up 2,250 acres of the best mining lands in one body, which is now owned by these speculators, and will be worked by coolie labor to the exclusion of the honest miner. How do they manage to acquire so much of this valuable land? I will tell you. They take \$500 worth of hydraulic pipe, and lay it upon twenty acres, and then make affidavit that they have put so much improvement upon the land. The next day another one of the ring hauls that hydraulic pipe upon twenty other acres; then a similar affidavit is made; and so they will go on until they occupy the entire country.

On three hundred claims, within the last year, the requirements of law have forced us to perform \$162,500 worth of labor. As a further requirement, we have paid in cash about \$113,750, making an aggregate of \$276,250 to acquire title to probably three hundred acres of land. Of this expenditure the Government received only \$812.

The Senate Committee on Mines and Mining has referred the Mineral Patent bill, together with the amendments, to the Commissioner of the General Land Office, and Commissioner Drummond has prepared a report, in which he says both the amendments proposed in behalf of Sutor are injudicious and unwise; that the Holman amendment is not needed, because the bill as it passed the Senate does not affect Mr. Sutor's interests at all, and the Negley amendment would be injudicious to the miners, and would effect a total change in the policy of the law governing the mineral lands. It is the policy of the law that miners should not be compelled to apply for patents until they need them to protect their rights. As for as Sutor is concerned, there is no necessity for this amendment to protect him in his rights. He is now secure, whether the miners take out patents or not, being protected by existing laws.

The bill will not come up for consideration in the Committee until the 20th of this month.

PATENTS & INVENTIONS

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., April 14, 1874.

For WEEK ENDING Mar. 31, 1874.

NEEDLE.—Ella N. Gaillard, S. F., Cal.

A Good Binder for \$1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for \$1.50—containing full title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Presses. 1amhp

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 25 cts.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Benjamin Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate District, Lyon county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal.

Geneva Consolidated Silver Mining Company.

Location of principal place of business, City and County of San Francisco, State of California. Location of works, Cherry Creek Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal.

Missouri Quicksilver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Clinchbar Mining District, Sonoma county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal.

gether with costs of advertising and expenses of the sale. I. T. MILLIKEN, Secretary. Office—Room 14, 302 Montgomery street, San Francisco, Cal.

POSTPONEMENT.—The above sale is hereby postponed till Saturday, the eighteenth (18th) day of April, 1874, at same hour and place above mentioned. I. T. MILLIKEN, Secretary.

Hudson Gold Mining Company—Location

of principal place of business, San Francisco, Cal. Location of works, Cherokee Mining District, Plumas county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal.

Jefferson Gold and Silver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Brown's Valley, Yuba county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, No. 401 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth day of April, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the fifteenth day of May, 1874, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office—Room 7, No. 401 California street, San Francisco, Cal.

Land Purchasers' Association—Office, No.

425 Kearny street, San Francisco, Cal. Notice is hereby given, that at a meeting of the Directors or Trustees of this corporation, held on the 14th day of April, 1874, an assessment of ten dollars per share (being the 40th monthly installment on the subscription to the stock) was levied upon the capital stock of said corporation, payable immediately in United States gold coin, to the Secretary, at No. 425 Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 9th day of June, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, No. 425 Kearny street, Room No. 2, San Francisco, California.

Lady Franklin Gold and Silver Mining Company.

Principal place of business, City and County of San Francisco, State of California. Location of works, Silver Mountain Mining District, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of March, 1874, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, 607 Montgomery street, San Francisco, Cal.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., January 14, 1873.
A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco.—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles' Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump.—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a First Premium and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List, September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

CAST STEEL SHOE AND DIE COMPANY,

OFFICE—Room 28, Hayward's Building, 419 California St., S. F.

Patented CAST STEEL SHOES & DIES for Quartz Mills.

Price, 20 cents per Pound.

CAST STEEL DIE.

An improvement greatly needed—being Stronger, more Durable and Economical than Cast Iron; as the Dies, when worn down, can be welded to the Shoes as easily as bar steel; never break, keep their full striking surface. Battery of five shoes crushes one-ton more ore in 24 hours than Cast Iron Shoes, will wear as long as four sets of Cast Iron Shoes, and can be worn down to 1/2 inch in thickness. The stubs can be welded into Picks, Hammers, etc.

—ALSO—
Cast-Steel Tappets, Cams, Hammers, Gearing and Castings

OF ALL KINDS, A SPECIALTY.
It takes forty days to fill orders.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; if then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Man factured by California Brass Works, 125 First street, S. F. 24v23tf

THE SELDEN

DIRECT-ACTING STEAM PUMP,

A. CARR, Manufacturer & Proprietor.

Patented

Aug. 2d, 1870.

MILLMEN.

Boss' Quicksilver Pump saves labor and waste of metal. Address, M. P. BOSS, Bullionville, Nev. 15v7-3m

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. E. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoekin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE OLAN.

STEEL SHOES AND DIES

FOR QUARTZ MILLS.

Made by our improved process after many years of patient research and experiment. We have succeeded in producing STEEL SHOES AND DIES for QUARTZ MILLS, which are unequalled for

Strength, Durability and Economy.

Will wear three times longer than any iron shoes.

BUILDERS AND CONTRACTORS

Of Quartz Mills, Pans, Separators, Concentrators, Jigs, Hydraulic Rock Breakers, Furnaces, Engines, Boilers and Shafting, and general Mining Machinery in all its details and furnishes of Mining Supplies.

All orders promptly filled.

MOREY & SPERRY,

Liberty St., N. Y.

Examination solicited. 9v28-1y

THE ONE-PLUNGER JIG,

Delivered on R. R. Car at Denver, Col., or St. Louis, Mo.

Separates in one and the same operation—1. galena and sulphide of silver; 2. pyrites or blende; 3. tailings, containing no valuable parts; or, 1. gold; 2. pyrites; 3. tailings (quartz, etc.) containing no valuable parts; or, 1. copper; 2. tailings, containing no valuable parts. The One-Plunger Jig can be combined with existing stamp-mills with highly important advantage, as after amalgamation it will recover completely all fine metal and all base ores and all mercury out of tailings. It concentrates all fine metal ores to such cleanliness that low grade ores can be shipped, after concentration, as first-class ores. Its feed and discharge are automatic. Its construction offers better guarantee against loss and repairs than any other apparatus in use. For particulars, apply to the inventor,

F. CAZIN,

Mining and Civil Engineer, Denver City, Col.

Crushing, Sampling Pulverizing and Working Ores, Minerals, Paints, etc.

We find the highest cash purchasers for GOLD, SILVER, COPPER AND LEAD ORES; pay special attention to consignments and execute with promptness any orders entrusted to our care, and assure the miner he can save from 8 to 10 per cent. of expense by consigning directly to these works.

GEO. D. WYMAN,

13v28-1f Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Number 17.

Extension Steps for Railway Cars.

Henry Albert, of this city, has procured a patent, through the Scientific Press Patent Agency, for an improvement in extension-steps for railway cars, the plan of which is shown in the engraving on this page. The steps are constructed so that they may be extended down near the ground, when the cars stop at a station, in order that the passengers may easily mount to the platform; but when the cars are ready to start, the steps can be drawn up to the ordinary length, and thus be out of the way of any obstruction on the road.

In the engraving, A is the end of a railroad car, and B, the platform; C, D, and E, are the three steps ordinarily attached on each side of the platform. These permanent steps only reach half way to the ground, and are always inconvenient, especially at stations where there are no platforms. To remedy this, Mr. Albert arranges side-boards, f, to slide up and down along the side-boards, g, of the permanent steps; suitable guides, i, being provided. The sliding side-board, f, which is next to the end of the car, extends upward along the side of the car at the proper angle, as at j, and this upward projecting portion also moves between dovetailed guides, k, l, on this side of the car. The lower ends of the sliding side-boards, f, are connected by a step, m, so that they will move together. Each of the boards, f, is provided with a longitudinal slot, n, which is as long as the distance which it is desired to extend the steps, and a pin, o, projects from opposite the end of the lower permanent step, through the slot.

Between the lower permanent step, E, and the connecting step, l, of the sliding portion, is another step, O, which has a square tenon on each end. This square tenon is of a proper size to fit snugly in the slot, m, and move up and down along it when required. Two links, p, p, shown in the step, and in detail in the sectional view, are joined together at one end, while one of their opposite ends is attached to the projecting pin, o, of the permanent steps, and the other to a pin projecting from the end of the tenon of the sliding steps. These jointed links are just long enough to support the sliding steps at the proper distance between the connecting step, l, and the lower permanent step. On the inner end of each of the upper guides, i, of the sliding boards, a pin or lug, q, is provided, at a point which will be opposite to the step, O, and also other pins, q, will be opposite the lower permanent steps when the sliding portion is extended. Other projections, r, are secured to the step, O, and also to the lower permanent step at right angles to the lugs, q, so that when the sliding steps are lowered into position, the lower pins, q, will first strike the pins, r, of the step, O, and carry it down to its proper position, or until the hinged links are fully extended.

When fully lowered to this point, the upper pins, q, will have come against the pins, r, on the permanent step, so as to aid in supporting the extension. To accomplish this movement properly, the lower projections, q, on the guides, are shorter than the upper ones, q, so that they will pass the projections, r, on the permanent steps, without striking; and, as a consequence, the projections, r, on the steps, O, are closer to the guides than those on the permanent steps, so that the short pin will strike it, in order to force it to its proper position. When the steps are extended, the step, O, will be held firmly in its position by the square tenons which fit in the slot at each end.

When the steps are drawn up, the lower connecting step forces the step, O, upward until it strikes the lower permanent step. This step can be extended or contracted by a lever, V, which fits closely against the end of the car. This lever can be a single bar, or of a V-shape, as represented in the drawing. In the latter case, one arm of the V-lever will be secured on a swivel block, W, which is attached to the sliding extension, j, of the side-board, so that the brakeman, or other person, can, as soon as the cars cease moving, lower the steps.

By this arrangement the inventor provides telescopic or extension steps, which can be either lowered or elevated as necessary, thereby avoiding trouble and annoyance to passengers getting on board or leaving railroad cars.

The steps on one side of the cars, shown in the cut, are down, and on the other side are represented as up. The cut to the left shows the operating mechanism more in detail.

The Gold Run Hydraulic Company.

The claims of this company at Gold Run, Placer county, have been worked more or less for fifteen years. It is at present owned by the Cedar Creek (English company) and Miner's Ditch Company. To W. W. Anderson, for two years superintendent of these claims, and a miner of many years' experience, we are indebted for the principal items following. The claims are 2,400 feet long, by 600 feet wide. The first working comprised acres of gravel

in a month. Ran about five months in 1873. The largest clean-up, \$7,700. Gold, fine. Six to nine flasks of quicksilver are deposited during a run. In warm weather, one-third to one-half a flask is lost; and, during cold weather, about a flask gets away. Had the old bank and present facing been worked together—say, 200 feet in height—the ground would have worked at a great deal better advantage.

Blasting in Hydraulic Mines.

Perhaps all of our readers are not aware of the full extent to which powder is used in hydraulic mines. At Dutch Flat giant powder is employed to break up the boulders so that the fragments will pass through the sluices, leaving

ALBERT'S EXTENSION STEPS FOR RAILWAY CARS.

worked down with old fashioned hand pipes to the depth of about 100 feet on the average. The company are now piping over the same ground, taking it down some 100 feet deeper. They are still leaving a large deposit of unknown depth to the bed rock, which can only be worked after the completion of the tunnel mentioned in a previous issue. Two of Hoskin's giants are used for piping. For convenience of handling in front, and to gain a more concentrated stream, these pipes were made by special order about 4 1/2 feet longer than those of ordinary construction, being 12 feet in full. Including waste water 840 inches are used daily. Water rats in this district are 12 1/2 cents per twenty-four hours.

This sluices of this company are 1,500 feet long and four feet wide; water, four to five inches deep; grade, seven to seven and a half inches in 12 feet. Boulders, one foot or more in diameter, pass "finely" down the sluice. Eight hands are employed, running 24 hours.

Yellow pine and pitch are used for lighting up the diggings in this section, one to one and a half cords being used nightly in some of the claims. Cost, \$4 a cord. Clean up about once

no rocks and stones corded up, as formerly, on the bed rock of old diggings. A system of "top blasting" is practised, followed by breaking open giant cartridges and pouring the powder on to the rock. This is sometimes built over with clay to hold it in place or gives greater effect to the blast. A fuse and cap explode the charge. Huge boulders which cannot be sledged, nor blasted (without drilling) by black powder, are thus quickly reduced, pitched into the sluices, and entirely got rid of.

Pipe clay, the terror of many mining claims in early days, is now disposed of by blasting with giant powder. After the blocks of clay are rolled down from the face of the diggings by this powerful hydraulic pipes, a "clay auger" is sent with ease into the center of each. This is followed by one-quarter or more of a cartridge of giant powder, with fuse attached. When all is prepared, the miner fires in succession perhaps 20 shots by aid of a hot iron and rod. This disintegrates the cement so that it is practicable to reduce it by action of the water, and prevent solid particles of clay from robbing the sluices as formerly, by carrying off gold first imbedded in its sticky surface.

Pullman Cars and Air Brakes in England.

The English journals of recent date contain numerous articles complimentary to the railway systems of this country. They refer more directly to the Westinghouse air brakes and Pullman palace cars. A great number of careful and accurate trials were made with reference to the efficiency of the air brakes system, the results of which proved in every way satisfactory. It seems rather strange that this system was not before adopted in England, since it has been in use with such success in this country. However, some of the more conservative individuals in that conservative isle did not believe in anything new or anything American, on general principles, and it was not until the efficiency of the apparatus was forced upon them that they consented even to try it. As Englishmen are, however, conservatives, willing to adopt any economical arrangement, after it is once proven to their satisfaction, the Westinghouse brake will probably be extensively used. They do not like the idea of a proposed change, but when it is once effected and is advantageous, they allow themselves to be overcome.

The latest trials have been with the Pullman palace cars, something which Englishmen with their love of ease ought all to appreciate. They have been placed on the Midland Railway, and judging from the reports in the English papers, satisfy even the fastidious Britishers with their ease of motion and elegant fittings. Still the cars are as yet only considered as an "experiment," as the following item from a prominent London paper will show: "The manager of the Midland line, Mr. Allport, has always shown that innovations—if they are but improvements—have no terrors for him; and as he was the first railway manager to run third-class carriages in all trains, so he is the first to recognize the undeniable advantages offered by the use of the Pullman cars. As we learned by personal experience of the most gratifying kind, the passenger in the Pullman car has comforts beyond those of the best first-class carriage ever made, and, in spite of the vexatious smallness of our island, which prohibits journeys of a length which is common in the greatest country on earth, we venture to predict a very fair amount of success for this new experiment on the Midland Railway."

The reports go on to describe the cars in detail, size, build, adornment, etc. They speak of the greatest novelty being the facility afforded for passage from one car to another, and they also speak of the ease with which they start up when steam is turned on the locomotive, attributable to the "Miller platform." Of course there will eventually arise something to grumble about, or it would not suit the British public, and this something will most probably be the charges for riding on these cars. However, as Englishmen usually travel with elaborate outfits, calculated to be conducive to personal comfort, all of which is expensive and troublesome, they ought not to growl about paying a little extra for increased comfort and better accommodations. Those "journsying" about the "tight little island" can in a short time do so with greater ease, the only hindrance being that the distances are so short. "Tip" Dorrit, Little Dorrit's scape-grace brother, when traveling in Switzerland was possessed of an equipment so elaborate and extensive, that, as Dickens expresses it, the only fear was that the world would not afford a proportionate amount of travel. This may be the case with the Pullman cars in England, as the shortness of the routes prevents full justice being done to the cars.

THE WHITE PINE TUNNEL.—A bill is before the Senate granting to William P. Walton the right to construct a tunnel, nine miles long, through White Pine Mountain, Nevada, together with the right to purchase six sections of non-mineral land, south of this tunnel, at \$1.25 per acre, and this right to purchase at \$5 per acre, all mineral lands discovered by the tunnel, provided that local mining laws do not prevent such purchase.

The Senate Mining Committee has received the resolutions of the Nevada miners' meeting protesting against the adoption of the Comstock Lode and Sinter Tunnel amendments to the mining bill.

CORRESPONDENCE.

Notes of Travel in Colorado.

(By our Traveling Correspondent.)

EDITORS PRESS:—I have much that is interesting to write about, which would be pleasing to the general reader; but knowing the greater percentage of your readers to be connected with, or interested in, mining, I will confine myself to that subject. To get to this district from the main trunk line of the railway east, the traveler diverges from Cheyenne, Wyoming Territory, on the Union Pacific Railroad, south to the city of Denver, the capital of Colorado Territory. Distance, 110 miles; thence nearly northwest to Floyd Hill, via the Colorado Central Railroad (passing Golden), distance about 33 miles; from there to Georgetown, via Idaho Springs by stage, distance, 15 miles. Total distances from Cheyenne 153 miles, and total cost \$17, currency; at which place you are in the center of

Griffith District.

During the months of August and September, 1859, the Griffith brothers, with a party of 11 men, prospected for gold in what is now Clear Creek county. On the 17th day of September of that year George F. Griffith discovered the Griffith lode. Other discoveries were soon made, which formed the nucleus around which a new district was organized. Twenty-six men were at the organization, and by unanimous vote a large portion of the upper part of what is now Clear Creek county was named the Griffith district. At this time the mining season was far advanced. A few hundred dollars had been washed out of the Discovery claim on the Griffith lode; but as it was the general impression at that time that snow would fall to great depth in the valley of South Clear creek, the new district was entirely abandoned during the winter of 1859 and '60. Early in the spring of 1860 the Griffith brothers began to build a wagon road from Central City to the new mines, and completed it in July. A miners' meeting was held on the 11th day of June, and the town of the new district was called Georgetown, in honor of George F. Griffith, the discoverer of the first lode. The early pioneers of Georgetown, you may readily grant, had some pluck, when you are told that with a working force of from five to 60 men during the years 1860, '61, '62, '63 and '64 the entire district produced less than \$200 in gold.

The lodes were large, well defined and all that, but there was too much galena in the ore. Old California miners were nonplussed. If galena was found in a lode, it was not even recorded; and the necessity of a freer circulation of such papers as the *Mining and Scientific Press* may be inferred from the fact that ordinarily intelligent men lived in this rich district for five years without discovering that this was a silver region. We say that the *Press* should be circulated, because nature has ordained that the American people are to become the great mining people.

At this present time Georgetown and vicinity has a population of about 3,000 people, and, though the "thirst for gold" led to its occupancy, it is now demonstrated that a smaller percentage of gold is contained in the bullion shipped from this district than from any other silver producing region in America. The county officers are good men, and the police regulations of the town and county are exceptionally good.

H. A. Spruance, one of our oldest San Francisco wine merchants, is Recorder of the county.

The following are some of the principal mines that I had the pleasure of visiting, together with the different reduction-works connected with the same: the first of which was the

Pelican Silver Mining Company.

This mine is not incorporated; is owned by E. S. Streeter, Thomas McCunniff, James C. Ford, E. Y. Naylor and Jacob Snider. Thos. McCunniff, Supt., and E. Y. Naylor, Secretary, and Treasurer.

This company's property consists of twelve different lodes, the principal ones of which are the "Pelican," "Gillah," "Bellwether," "Forest," "Unicorn," and others, containing 16,000 feet in length (more or less). These lodes constitute the above named company, and are located about two miles nearly west of Georgetown, on Sherman and Republican mountains; situated at an elevation of 10,000 feet above the sea level.

This mine was first discovered in the float in the spring of 1868, by E. S. Streeter, and the vein finally struck in December, 1870. It has been successfully worked ever since, yielding on the average \$300,000 annually. Some four of their locations are covered by U. S. patents, and this company have expended some \$200,000 in securing patents and buying off adverse claimants, to perfect their titles.

The Development of these Mines

Consist of numerous drifts, shafts, slopes, etc., aggregating some 3,500 feet, and four tunnels, covering in length over 1,200 feet. Numbers 1 and 2 are now the principal openings to the vein. No. 2½ is now in some 510 feet, and within 200 feet of the lode, working under contract day and night. These different tunnels strike the vein at 150, 250 and 450 feet from the surface and tunnel. No. 3 will strike the lode

at a depth of 700 feet. The ore body in these locations runs from a few inches to several feet in width. The walls are a mixture of porphyry and granite; the general country rock is granite; the ores contain some half dozen minerals, the principal of which is silver, averaging some 200 ounces per ton, varying from 140 to 950 ounces per ton. It is not uncommon to find small deposits of brittle silver that run from 6,000 to 16,000 ounces per ton, and "ruby silver" running as high as 20,000 ounces per ton. In this mine they also find some silver glance, varying from 22,000 to 32,000 ounces to the ton. The ore also contains about 15 per cent. of galena and the same of zinc; some iron pyrites, carrying from one to one and one-half ounces of gold, which is lost by the present mode of working. At present they are working some sixty-five men; they have openings at the present time to put on 200 men. They are extracting some 20 tons of ore daily of all grades. Seventeen different shipments to England, aggregating 170 tons in weight, averaged 352½ ounces in silver, as per returns. In connection with their mines this company are leasing reduction works in Georgetown, known as the property of the

Pelican Silver Milling Co.,

Under the management of Mr. Geo. C. Munson, with two Bruckner cylinders, one Dodge crusher, one Ball pulverizer, with Barrell amalgamators. These works are very complete in every department, and running successfully at the present writing. One mile farther west is located the

Colorado Terrible Lode M. Co.,

An English incorporation, with a capital stock of £100,000, (or \$500,000), the principal office of which is in London, England. Sir Cecil Beadon, President; F. Andrews, Secretary; Geo. Teal, resident Manager, at the works, which are located some three miles west of Georgetown, at Brownsville. This corporation's property consists of a lode 1,100 feet in length by 50 feet in width, covered by U. S. Patent, the first ever granted in Clear Creek county, California. The ore body runs east and west and pitches to the north at an angle of 73°. The country rock here is granite; the ores contain silver from 500 to 600 ounces to the ton, lead 50 per cent., a considerable of zinc blende, and a trace of iron, copper, arsenic and gold. The mine of this company is located at an elevation of about 9,300 feet above the sea level.

The Development of this Mine

Consists of one cross cut tunnel 340 feet to the ore body, and extending some 25 feet beyond; this tunnel taps the lode at a depth of about 400 feet from the surface, and is being worked by three levels above the tunnel. At this point a shaft is sunk to a depth of 150 feet, developing the mine to a depth of 550 feet from the surface. This shaft is being developed by two levels below the level of the tunnel, making six levels in all and averaging some 60 feet apart. Drifts and tunnels have been run on this lode some 3,000 feet; the ore body only averages about four inches in width, but its richness makes up for its width. Occasionally, however, immense deposits are come across, and have run as high as 16,740 ounces in silver. This company's first-class ores are sent to Liverpool for sale, and all lead ores that will pay the transportation; the remainder is sold to the reduction works at Georgetown. They are now erecting concentration works of their own, which are expected to be in operation by the 15th of May, the capacity of which is intended to be about 40 tons daily. This corporation are now working 60 men, and taking out some 250 tons of ore of all grades monthly. They have a very fine wire tramway 750 feet in length, with capacity to transport all their ores from the mine to their concentration works, to the extent of 50 tons daily, at the cost of 20 cents per ton. They also have a very complete assay office and do all their own assaying.

The Marshall Silver Mining Company of Georgetown, Colorado—Incorporated.

Capital stock, \$600,000. F. J. Marshall, President and Superintendent; S. W. Bouton, Secretary and Treasurer. Chartered to perforate Leavenworth mountain. Tunnel located one and three-fourths miles south of Georgetown. Distance through the mountain, 4,200 feet; length already run, 1,300 feet. Altitude, 9,600 feet above the sea. No. of lodes cut, 10. No. of lodes worked, 2. Average number of men employed, 30. The only vein worked from the tunnel is "Tunnel Lode No. 5," in which have been cut 1,400 feet of shafts, drifts and levels, mostly within 200 feet of the surface. The tunnel cut this vein at 400 feet depth.

The product of this vein in 1873 was \$85,000. The crevice of this lode is from 50 to 60 feet wide, with several distinct ore veins, of varying richness, from 100 ounces to 2,000 ounces per ton. The belt of lodes of which "No. 5" (also called the "Colorado Central") is the "mother vein," is some 400 feet in width. The tunnel is now being pushed, and is approaching a second belt of lodes distinctly different in character from the one passed, occupying the crest of the mountain, and exceedingly rich on the surface.

Stewart Silver Reducing Company.

An incorporation of \$100,000 capital stock. Is incorporated under the laws of the State of New York. J. O. Stewart, President; J. L. Brownell, Secretary and Treasurer; office 23 Broad street, New York city. J. O. Stewart, resident Superintendent. This corporation is owned by some three or four persons. Their property consists of the "Taylor," "Mount Diablo," "Cuckoo" mines, and other mining property, neither of which are being worked at

the present writing. They are at present purchasing ores from other mines, and reducing them at their

Twenty-Slamp Mill,

Located in the suburbs of Georgetown. They use twelve Vasey pans, with settlers to correspond. It was built in Chicago, but after the California style in every respect. It is very complete in every department, run by a steam engine of eighty horse power, two boilers, etc. This mill is run night and day, and has a capacity to reduce some twenty tons per day, (twenty-four hours.) All of the ores reduced at this mill have first to be roasted. For this purpose they have one large and four small reverberatory furnaces; which, combined, have a capacity of from twelve to fourteen tons per day, but they are at present engaged in erecting another large reverberatory furnace, which will make their roasting capacity correspond to their crushing capacity, when completed. This company are shipping \$50,000 worth of silver bullion monthly. The ores consist of zinc blende, galena, some little fahlerz, or gray copper, ruby and brittle silver. The ores average about fifty per cent. of blende and galena, the former predominating. The silver value is about 160 ounces per ton. The bullion produced from the above ores runs about 800 fine. This company employs some forty-five men.

Miners' Head-Quarters.

A much needed acquisition to Georgetown is the Miners' Exchange of Morris Brothers & Co., the general rendezvous and head-quarters for all the miners and mining business of the surrounding country. In connection with their finely-appointed assay office, a large and handsome free reading room is nearly completed, supplied with mining and newspapers and magazines, and is a general and pleasant resort for citizens, miners and visitors from all sections. The house does a purely legitimate mining brokerage business, furnishing reliable mining intelligence and reports to absentee mine owners and others, and secures the highest bids on ores consigned to them.

L. P. Mc.

Lower California Placer Mines.

The San Diego *World* of the 10th inst. says: As we expected, the dimensions of the placer region of Lower California prove to be of vast extent. A few days ago Don Ygnacio Arguello came to San Diego from San Rafael. He brought with him details of a very interesting placer discovery in the neighborhood of that place. On the first of the present month placer diggings were struck in the vicinity of the house of Don Ambrosio Castillo. The gold is very coarse, and of high grade. Nuggets ranging in value from \$2 50 to \$25 are frequently picked up.

We have long desired to obtain some definite information as to the extent of the Japa Placers, and owing to the kindness of the Messrs. Denton & Phillips we are at length able to satisfy the curiosity of our readers. With regard to Mr. Denton, it is only necessary to state that he has probably surveyed more Mexican mines than any man living; and as to Mr. Phillips, he is a geologist and mining expert of some reputation in Nevada. The Japa Placers, according to these gentlemen, are but a trifling portion of an immense placer territory, much of it exceedingly rich. The prospectors followed the channel of the creek clear to the desert from Japa, and found very fair placer diggings all the way, a distance of 45 miles. It was the rainy season, and water abundant all the way. There are indications that water can be had at many places at all seasons of the year. These gentlemen, in the course of their tour, swung southwest to Santa Catarina, distant 75 miles from Japa, and about 150 from San Diego. The placers extend for all this distance, and are often exceedingly rich. Santa Catarina was the extreme southern boundary of their trip. An arrangement is being made to flume the waters of the Great Laguna, which is situated on a mountain at an altitude of eight or ten thousand feet, in order to work an exceedingly rich bed of gravel which extends into Santa Catarina. At a distance of five miles from the Laguna the flume will strike the eastern edge of the placers in that vicinity.

Finally, our informants are of opinion that Lower California is as rich a spot as lies on the Pacific Slope, and that valuable deposits of copper, iron, silver and gold are lying there perdn on every side for whoever has the good sense, backed by a little capital, to go and develop them.

THE MINES NEAR CAMBRIA.—A correspondent of the San Louis Obispo *Tribune*, writing from Cambria, San Louis Obispo county, says:

The mines are situated about ten miles in a northeasterly direction from the beautiful little town of Cambria, and it is, therefore, you see, a good day's ride to visit the different mines and return to town. The first mine of any note is the Keystone, owned by Cross & Co., of San Francisco. This mine has been worked for over two years, and they have taken out a large amount of good ore—probably six thousand tons are now on the dumps, with a large deposit in the mine in sight, which they are now breaking out. There is no telling the value of this mine now; it cost its present owners \$22,000, and they made a good investment when they bought it. The company have got in their tunnel about 700 feet. They intend putting up smelting works immediately, and when erected they will conduce largely to the speedy development of the mine.

Stickeen River Mines.

The following items from the Stickeen river mines was compile from the *Victoria Colonist*:

We have been placed in possession of several letters from the heart of the Cassiar gold diggings, all of which speak hopefully of the prospects. The general impression is that a great gold field has been discovered; but the writers, almost to a man, declare that there are already too many men on the spot, and that work cannot be successfully prosecuted until May. A few had hit upon the expedient of thawing out the ground and washing it in rockers, and were making from \$10 to \$30 per day.

William Jeffrey writes to Charles Robinson, from the Hudson Bay Company's fort, on Stickeen river, dated 19th of March. The writer says that he and H. Saunders and W. Bradon had overcome great difficulties. The frost was severe, "one half the pot boiling while the other half froze." The difficulties of reaching Cariboo in early days were nothing to those encountered on the Stickeen. The snow was 10 feet deep in places, and two or three trips had to be made to get the stuff up on dog-sleds. The weather was changing, and a thaw had set in. Taylor and Clarke were left behind. But the writer and party stood the hardships like "bricks," and had overtaken some men who left Victoria six days before them. Several miners were at the fort, sick or frost-bitten. Mr. White, at the fort, was very kind to all.

A letter from a miner on Dease lake says that he has been out prospecting. Snow covered everything, and the ground was frozen; but fires were built, and the pay-dirt thawed. Good prospects were had. Several large pieces of gold were found in the dirt. The writer says the country is rich.

The miners have held a meeting and decided to exclude Chinamen from the diggings. Two Chinamen had already gone in, and are allowed to stay, by promising to write to their brother Chinamen not to come up.

Large quantities of goods are cached along the river banks, and will not be moved until the ice is out of the river.

The supply of provisions in the mines is very short. Bacon is \$1.25 per pound, flour \$1.40 a pound, \$2.50 per pound for tea, and a rise anticipated. There are no provisions at Buck's Bar.

Mr. A. Martin, to whom we are indebted for the above information, brought down 130 ounces of dust.

The Olympia *Courier* says: A letter from Mr. Charles Potter, at the "Great Portage on the Stickeen, about seventy-five miles from Dease creek," came to his wife in this city to day, and she has kindly permitted a few extracts to be made. The writer says he and Mr. Shelton went in ahead of their companions, and located claims for all, and then went back to assist in getting in the sleds with provisions, etc. The report of any one freezing to death in that region was false. Of course, it had been cold weather, but that was about over. It is yet hard to tell about the mines; the ground is frozen so hard that it takes a long time to prospect a claim. He would not advise any one to come up at present. All the men who were in there last fall say that the mines paid well. One man took out in one day, with a rocker, nine ounces and fourteen dollars. There are about five hundred men in the mines and on the river coming up. All from this region are well—as the writer jocosely says, "all right, tough and dirty." Mr. Shelton has also received a letter from Lewis Shelton, who is with the party that left this city. He says he can't tell any more about the richness of the mines than he could before he started, and advises any of his friends who may design going to the mines not to start till May.

MINING SALE.—The *Plumas National* has the following: On Wednesday last the claim belonging to Rockwell & Co., near Little Long Valley, known as the Alturas gravel mine, was sold to Mr. A. J. Gould. The price paid, we are informed, was \$1,000 per share. The claim is situated on the head waters of Long Valley creek, and is thought by good judges to be one of the best undeveloped placer mines in the country. The gravel is deep and prospects well and uniformly, from the surface to bed-rock. A comparatively slight expense in ditching brings the water to the claim, and high enough to afford all the pressure required for hydraulic purposes. The flumes will dump over a precipice hundreds of feet high, making an "everlasting dump." The Alturas Co. control all the water high enough to be used on the ground, and their claim is extensive enough to last for years. We heard a mining expert who had prospected the ground, say that he considered this the finest bank of gravel he had ever seen in California. The company will commence work in a short time, and we confidently expect to chronicle some grand results after the Alturas is fairly opened.

QUICKSILVER.—The work at the St. John quicksilver mine, Napa, is being pushed forward vigorously and satisfactorily. New tunnels and drifts are being run, making most favorable developments of the extent and the richness of the mine. There are now seventy men employed; a greater number than ever before. The work of building an additional furnace at the mine was commenced this week, which, when completed, will double the smelting capacity. The St. John is now turning out 200 flasks regularly each month.

SCIENTIFIC PROGRESS.

Gun-Cotton.

It is now more than a quarter of a century since the discovery of gun-cotton, and yet we have not learned fully regarding its wonderful nature and capabilities. It was at one time, soon after its discovery, supposed capable of supplanting gunpowder in war; but this expectation soon gave way to the astounding truth, that it was destined to play a much more conspicuous part in facilitating and perfecting the beautiful art of photography. It was the handmaid of the arts of peace, rather than an agent of destruction in human combats. At Woolwich Arsenal, England, the chemists, Professor Abel and Mr. E. O. Bawn, have devoted more than ten years to investigations into the nature of this explosive, and some of the results reached are curious enough. The object of the researches was to learn if it could not be rendered safe and effective for gun use in the English navy. To reach the desired result the violence of its explosion had to be tamed, then a compressed form of the material was devised, and then it was shown that like its sister explosive, nitro-glycerine, gun-cotton could be violently detonated if ignited by a charge of fulminate. Gun-cotton, in fact, turns out to be sympathetic, for, according to the energy with which it is inflamed, so it responds in its behavior. Thus, if gently ignited by a spark, the cotton, in the form of yarn, smouldered slowly away; when set fire to by a flame, it burnt up rapidly; if in the form of a charge it was exploded in a mine or a fire arm, it at once represented the shock and replied with corresponding energy, behaving like gunpowder under similar circumstances; while, lastly, if fired with great violence with a few grains of fulminate, it was detonated with as much force and with the same terrible effect as its instigator.

The most curious fact learned in this investigation is that gun-cotton is exploded to best advantage when in a wet condition. This grand discovery is of the utmost importance, because, although there may be danger in storing and using gun-cotton when dry, the most nervous would scarcely hesitate to employ it sopping wet. In this latter condition the material is, strange to say, not only non-explosive, but positively non-inflammable; so much so, indeed, that it would be probably as serviceable in putting out a fire as a wet blanket or a damp towel would be. It can neither be inflamed nor exploded when wet; and further, unless one has the key to its detonation—a little fulminate of mercury—it is of no more value as an explosive than so much wet paper pulp. When placed in contact, however, with a fuse of the proper construction and a cake of dry gun-cotton, to start the action, the wet pyroxiline detonates as readily as when the moisture amounts to but a fraction of one per cent. Moreover, the quantity of water in the material is really of no importance, for it has been found that for submarine mines, compressed cakes enclosed in a fish-gut-net, and thrown overboard with a dry primer and a fulminate fuse, will explode with just as much energy as when confined in a water-tight steel case.

Recent experiment has shown that the rapidity with which gun-cotton detonates is altogether unprecedented. Indeed, with the exception of light and electricity, the detonation of gun-cotton travels faster than anything else we are cognizant of. Thus detonation will run along a line of gun-cotton cakes, placed so as to touch one another, with a rapidity only inferior to that of electricity, setting fire to a charge or conveying a signal, if desired, almost instantaneously. Twenty thousand feet, or nearly three miles per second, is calculated to be its rate of traveling, according to Noble's electric chronoscope. In one experiment 42 feet of the material was fired, and records secured at every six feet; and in this case the results given were most uniform, for the velocity only varied from 19,000 to 20,000 feet per second, the ratio of transit being in no instance less than this.—*Boston Journal of Chemistry.*

THE HEAT OF THE MOON.—The Earl of Rosse, in a recent lecture before the Royal Institution, gave some interesting information concerning the various experiments heretofore made to detect the heat of the moon, and then described his own efforts in this line, which are the latest that have been made known. By means of a specula mirror, a thermo-pile, and a pair of reflecting galvanometers, made on Sir William Thomson's plan, and as are used for sending messages through the Atlantic cable, the Earl was enabled to demonstrate the presence of heat from the moon, but the temperature of the lunar surface still remains far from being determined. My calculations, he says, lead me to estimate the heat from the moon as the eighty-thousandth part of that from the sun. Bonger's experiments give the brilliancy of the full moon as the 300,000th part of that of the sun; Wollaston gives it as the 80,172d; Zollner as from 618,000th to 619,000th, and Boud as the 470,980th. The maximum of the lunar heat appears to be a little before full moon; the unequal distribution of its mountain and plains, perhaps, goes to explain this phenomenon.

FUCHSINE, it is claimed, has been used with success as a preservative of meats and other organic substances, one-hundredth part being sufficient to act as a preservative.

Microscopic Crystals in Plants.

Beside the familiar bundles of needle-shaped crystals, called raphides, dispersed throughout the cellular structure of certain plants, there are in the seed covers and leaves of several orders of plants, and in the pods of the bean family, multitudes of prismatic crystals of extreme minuteness, which have hitherto escaped detection. In the horned poppy, these crystals are as small as the 8,000th of an inch in diameter. In the gooseberry and elm, they are 1-3,000 of an inch; in the black currant, about half as large; in the black bryony, they are about 1-1,500 of an inch in diameter, thickly set at regular distances throughout the seed covers. In the gooseberry, they are so distinctly and regularly placed in the outer skin—each crystal in a separate cell—that they present the appearance of crystalline tissues. In plants of the bean family, the size is variable, the average being about 1-3,000 of an inch. In the garden pea, they are much larger. These crystals appear to consist chiefly of oxalate of lime, sometimes carbonate. Raphides are mainly phosphate of lime.

Plants most relished by animals are found to be especially rich in these microscopic crystals. In a piece of the midrib of a clover leaflet, 1.70 of an inch in length, Mr. Gulliver, who has added more than any other to our knowledge of these minute but important products of vegetable action, has counted 10 chains of crystals with 25 in a chain, making 250 in all, or no less than 17,500 to the inch. In like manner 21,000 crystals were reckoned for one inch of the aural margin of a single valve of a pea pod. The pod had four such margins, each three inches in length; so that in a single pod there must have been as many as 250,000 crystals. In view of the marvelous number of these crystals, as well as their regularity and constancy, Mr. Gulliver believes it no longer possible for physiologists to maintain that such structures are accidental freaks of nature, of no relation to or value in the life and use of the species.—*Scientific American.*

THE EFFECT OF HEAT ON TEXTILE FABRICS.—Recent experiments on disinfection by means of heat, made by Dr. Ransom, of Nottingham, England, show that white wool, cotton, linen, silk, and paper may be heated to 250° F. for three hours without apparent injury, although the wool will show a faint change in color, especially when new. The same may be said of dyed wools and printed cottons, and most dyed silks; but one kind of white silk easily turns brown by this heat, and pink silks of some kinds are also faded by it. The same temperature will, if continued for a longer period, slightly change the color of white wool, cotton, silk, paper, and unbleached linen, but will not otherwise injure them. A heat of 295° F., continued for about three hours, more decidedly singes white wool, and less so unbleached and white cotton and white silk, white paper, and linen both unbleached and white, but does not materially injure their appearance. The same heat, continued for about five hours, singes and injures the appearance of white wool and cotton, unbleached linen, white silk and paper, some colored fabrics of wool, or mixed wool and cotton, or mixed wool and silk. It is noteworthy that the singeing of any fabric depends not alone upon the heat used, but also on the time during which it is exposed. In the experiments the heat was obtained by burning gas with smokeless flames, and conducting the products of combustion, mixed with the heated air, by means of a short horizontal flue, into a cubical chamber through an aperture in its floor, and out of it by a smaller aperture in its roof. Fixed thermometers showed the temperature of the entering and outgoing currents, which represented the maximum and minimum temperatures of the chamber. A self-acting mercurial regulator maintained the temperature of the entering current at any required degree.

QUALITATIVE ANALYSIS OF BENZINE.—Commercial benzine often contains quite a large proportion of petroleum, which leaves a disagreeable odor when the benzine is employed for the removal of grease. A small piece of pitch is placed in a test tube and the suspected liquid poured upon it. Pure benzine will readily dissolve the pitch, forming a tarry mass, while adulterated benzine will be less and less colored in proportion to the amount of petroleum contained in it. Coal tar will dissolve easily in pure benzine, but forms distinct layers when impure material is employed for the solution.—*Sci. American.*

EXTRACTING CHLORINE.—The object of a new invention is to facilitate the extraction of chlorine from chloride of lime. For this purpose the chloride of lime is placed in an air-tight cistern or chamber partly filled with water and provided with one or more hollow shafts formed with hollow arms and capable of revolving, by which the chloride of lime contained in the cistern is agitated, and by a current of air passing through the shafts and arms the chlorine is extracted from the chloride of lime and mixes with the water, and the liquor when settled is drawn off for bleaching purposes.

In the juice of beets is contained an acid—metaphacetic acid. It has the formula of Arabic acid from gum arabic. A careful comparison of the two substances shows them to be identical.

MECHANICAL PROGRESS.

The Pneumatic Dispatch.

The London Times gives an account of the origin and development of the pneumatic dispatch system in England, and then goes on to describe the great pneumatic dispatch tube in the heart of London. It says:

The pneumatic tube extends from the London and Northwestern railway station at Euston Square to the general post-office in St. Martin's le Grand. The general station is in Holborn, where is also the machinery for effecting the transit of the trains. Here the tube is divided, so that in effect there are two tubes opening into the station, one from Euston to Holborn, and the other from the post office. The length of the tube between Holborn and Euston is 3,080 yards, or exactly a mile and three-quarters, a greater length than was originally contemplated, but which was rendered necessary by the avoidance of certain property on the route. The tube is of a flattened horse-shoe section, five feet wide and four feet six inches high at the center, having a sectional area of seventeen square feet. The straight portions of the line are formed of a continuous cast iron tube, the curved length being constructed in brick work, with a facing of cement. The gradients are easy; the two chief are one in forty-five and one in sixty, some portions of the line being on the level.

The steepest curve is of 70 feet radius. The tube between Holborn and the post-office is 1,658 in length, or 102 yards less than a mile, and is of the same section and similarly constructed to the first length. Two gradients of one in fifteen occur in the post-office section, but this steep inclination is in no way inimical to the working of the system. The Holborn station is situated at right angles to the line of the tubes, which, are, therefore, turned towards the station, into which each opens. All through trains, therefore, have to reverse there, and this is effected in a very simple manner by a self-acting arrangement. A train, upon its arrival, runs by virtue of its acquired momentum up a short incline, at the summit of which it momentarily stops, and then quickly descends by gravity. In its descent it is turned on to a pair of rails leading to the other tube, into which it enters and through which it continues its journey, the whole process of reversing occupying barely thirty seconds. Trains containing goods for Holborn station are simply run down from the top of the incline on to a siding.

The wagons, or carriers, as they are termed, weigh 22 hundred weight, are 10 feet 4 inches in length, and have a transverse contour conforming to that of the tube. They are, however, of a slightly smaller area than the tube itself, the difference, about an inch all around, being occupied by a flange of India rubber, which causes the carrier to fit the tube exactly, and so as to form a piston upon which the air acts. The machinery for propelling the carrier consists of a steam engine having a pair of 24-inch cylinders, and with 20-inch stroke. This engine drives a fan 22 feet 6 inches in diameter, and the two are geared together in such a manner that one revolution of the former gives two of the latter; or, in technical terms, the engine is geared at two to one with the fan. The trains are drawn from Euston and the post-office by exhaustion, and are propelled to those points by pressure. The working of the fan, however, is not reversed to suit these constantly varying conditions; it works continuously, the alternate action of pressure and exhaustion being governed by valves. The engine takes steam from three Cornish boilers, each 30 feet long, and 6 feet 6 inches in diameter. Telegraphic signaling is carried on between three stations by means of needle instruments.
